    ' Create the SelectCommand.
    cmd = New MySqlCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn)
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15)
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15)
    da.SelectCommand = cmd
    ' Create the DeleteCommand.
    cmd = New MySqlCommand("DELETE FROM mytable WHERE id=?id", conn)
    parm = cmd.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id")
    parm.SourceVersion = DataRowVersion.Original
    da.DeleteCommand = cmd
    Return da
End Function

```

C# example:

```

public static MySqlDataAdapter CreateCustomerAdapter(MySqlConnection conn)
{
    MySqlDataAdapter da = new MySqlDataAdapter();
    MySqlCommand cmd;

```

```

MySQLParameter parm;
// Create the SelectCommand.
cmd = new MySqlCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn);
cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15);
cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15);
da.SelectCommand = cmd;
// Create the DeleteCommand.
cmd = new MySqlCommand("DELETE FROM mytable WHERE id=?id", conn);
parm = cmd.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id");
parm.SourceVersion = DataRowVersion.Original;
da.DeleteCommand = cmd;
return da;
}

```

24.2.3.4.6. InsertCommand

Gets or sets a SQL statement or stored procedure used to insert records into the data set.

Value: A [MySqlCommand](#) used during [System.Data.Common.DataAdapter.Update](#) to insert records into the database that correspond to new rows in the [DataSet](#).

During [System.Data.Common.DataAdapter.Update](#), if this property is not set and primary key information is present in the [DataSet](#), the [InsertCommand](#) can be generated automatically if you set the [SelectCommand](#) property and use the [MySqlCommandBuilder](#). Then, any additional commands that you do not set are generated by the [MySqlCommandBuilder](#). This generation logic requires key column information to be present in the [DataSet](#).

When [InsertCommand](#) is assigned to a previously created [MySqlCommand](#), the [MySqlCommand](#) is not cloned. The [InsertCommand](#) maintains a reference to the previously created [MySqlCommand](#) object.

Note

If execution of this command returns rows, these rows may be added to the [DataSet](#) depending on how you set the [MySqlCommand.UpdatedRowSource](#) property of the [MySqlCommand](#) object.

Examples

The following example creates a [MySqlDataAdapter](#) and sets the [SelectCommand](#) and [InsertCommand](#) properties. It assumes you have already created a [MySQLConnection](#) object.

Visual Basic example:

```

Public Shared Function CreateCustomerAdapter(conn As MySqlConnection) As MySqlDataAdapter

    Dim da As MySqlDataAdapter = New MySqlDataAdapter()
    Dim cmd As MySqlCommand
    Dim parm As MySQLParameter
    ' Create the SelectCommand.
    cmd = New MySqlCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn)
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15)
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15)
    da.SelectCommand = cmd
    ' Create the InsertCommand.
    cmd = New MySqlCommand("INSERT INTO mytable (id,name) VALUES (?id, ?name)", conn)
    cmd.Parameters.Add( "?id", MySqlDbType.VarChar, 15, "id" )
    cmd.Parameters.Add( "?name", MySqlDbType.VarChar, 15, "name" )
    da.InsertCommand = cmd

    Return da
End Function

```

C# example:

```

public static MySqlDataAdapter CreateCustomerAdapter(MySqlConnection conn)
{
    MySqlDataAdapter da = new MySqlDataAdapter();
    MySqlCommand cmd;
    MySQLParameter parm;
    // Create the SelectCommand.
    cmd = new MySqlCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn);
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15);
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15);
    da.SelectCommand = cmd;
    // Create the InsertCommand.
    cmd = new MySqlCommand("INSERT INTO mytable (id,name) VALUES (?id,?name)", conn);
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15, "id" );
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15, "name" );

    da.InsertCommand = cmd;
    return da;
}

```

24.2.3.4.7. UpdateCommand

Gets or sets a SQL statement or stored procedure used to updated records in the data source.

Value: A [MySQLCommand](#) used during [System.Data.Common.DataAdapter.Update](#) to update records in the database with data from the [DataSet](#).

During [System.Data.Common.DataAdapter.Update](#), if this property is not set and primary key information is present in the [DataSet](#), the [UpdateCommand](#) can be generated automatically if you set the [SelectCommand](#) property and use the [MySQLCommandBuilder](#). Then, any additional commands that you do not set are generated by the [MySQLCommandBuilder](#). This generation logic requires key column information to be present in the [DataSet](#).

When [UpdateCommand](#) is assigned to a previously created [MySQLCommand](#), the [MySQLCommand](#) is not cloned. The [UpdateCommand](#) maintains a reference to the previously created [MySQLCommand](#) object.

Note

If execution of this command returns rows, these rows may be merged with the [DataSet](#) depending on how you set the [MySQLCommand.UpdatedRowSource](#) property of the [MySQLCommand](#) object.

Examples

The following example creates a [MySQLDataAdapter](#) and sets the [SelectCommand](#) and [UpdateCommand](#) properties. It assumes you have already created a [MySQLConnection](#) object.

Visual Basic example:

```
Public Shared Function CreateCustomerAdapter(conn As MySqlConnection) As MySqlDataAdapter
    Dim da As MySqlDataAdapter = New MySqlDataAdapter()
    Dim cmd As MySqlCommand
    Dim parm As MySqlParameter
    ' Create the SelectCommand.
    cmd = New MySqlCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn)
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15)
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15)
    da.SelectCommand = cmd
    ' Create the UpdateCommand.
    cmd = New MySqlCommand("UPDATE mytable SET id=?id, name=?name WHERE id=?oldId", conn)
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15, "id" )
    cmd.Parameters.Add( "?name", MySqlDbType.VarChar, 15, "name" )

    parm = cmd.Parameters.Add( "?oldId", MySqlDbType.VarChar, 15, "id" )
    parm.SourceVersion = DataRowVersion.Original

    da.UpdateCommand = cmd

    Return da
End Function
```

C# example:

```
public static MySqlDataAdapter CreateCustomerAdapter(MySqlConnection conn)
{
    MySqlDataAdapter da = new MySqlDataAdapter();
    MySqlCommand cmd;
    MySqlParameter parm;
    // Create the SelectCommand.
    cmd = new MySqlCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn);
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15);
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15);
    da.SelectCommand = cmd;
    // Create the UpdateCommand.
    cmd = new MySqlCommand("UPDATE mytable SET id=?id, name=?name WHERE id=?oldId", conn);
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15, "id" );
    cmd.Parameters.Add( "?name", MySqlDbType.VarChar, 15, "name" );

    parm = cmd.Parameters.Add( "?oldId", MySqlDbType.VarChar, 15, "id" );
    parm.SourceVersion = DataRowVersion.Original;

    da.UpdateCommand = cmd;
    return da;
}
```

24.2.3.4.8. SelectCommand

Gets or sets a SQL statement or stored procedure used to select records in the data source.

Value: A [MySQLCommand](#) used during [System.Data.Common.DbDataAdapter.Fill](#) to select records from the database for placement in the [DataSet](#).

When `SelectCommand` is assigned to a previously created `MySqlCommand`, the `MySqlCommand` is not cloned. The `SelectCommand` maintains a reference to the previously created `MySqlCommand` object.

If the `SelectCommand` does not return any rows, no tables are added to the `DataSet`, and no exception is raised.

Examples

The following example creates a `MySqlDataAdapter` and sets the `SelectCommand` and `InsertCommand` properties. It assumes you have already created a `MySqlConnection` object.

Visual Basic example:

```
Public Shared Function CreateCustomerAdapter(conn As MySqlConnection) As MySqlDataAdapter
    Dim da As MySqlDataAdapter = New MySqlDataAdapter()
    Dim cmd As MySqlCommand
    Dim parm As MySqlParameter
    ' Create the SelectCommand.
    cmd = New MySqlCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn)
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15)
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15)
    da.SelectCommand = cmd
    ' Create the InsertCommand.
    cmd = New MySqlCommand("INSERT INTO mytable (id,name) VALUES (?id, ?name)", conn)
    cmd.Parameters.Add(" ?id", MySqlDbType.VarChar, 15, "id" )
    cmd.Parameters.Add(" ?name", MySqlDbType.VarChar, 15, "name" )
    da.InsertCommand = cmd

    Return da
End Function
```

C# example:

```
public static MySqlDataAdapter CreateCustomerAdapter(MySqlConnection conn)
{
    MySqlDataAdapter da = new MySqlDataAdapter();
    MySqlCommand cmd;
    MySqlParameter parm;
    // Create the SelectCommand.
    cmd = new MySqlCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn);
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15);
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15);
    da.SelectCommand = cmd;
    // Create the InsertCommand.
    cmd = new MySqlCommand("INSERT INTO mytable (id,name) VALUES (?id,?name)", conn);
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15, "id" );
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15, "name" );

    da.InsertCommand = cmd;
    return da;
}
```

24.2.3.5. Using `MySqlDataReader`

To create a `MySqlDataReader`, you must call the `MySqlCommand.ExecuteReader` method of the `MySqlCommand` object, rather than directly using a constructor.

While the `MySqlDataReader` is in use, the associated `MySqlConnection` is busy serving the `MySqlDataReader`, and no other operations can be performed on the `MySqlConnection` other than closing it. This is the case until the `MySqlDataReader.Close` method of the `MySqlDataReader` is called.

`MySqlDataReader.IsClosed` and `MySqlDataReader.RecordsAffected` are the only properties that you can call after the `MySqlDataReader` is closed. Though the `RecordsAffected` property may be accessed at any time while the `MySqlDataReader` exists, always call `Close` before returning the value of `RecordsAffected` to ensure an accurate return value.

For optimal performance, `MySqlDataReader` avoids creating unnecessary objects or making unnecessary copies of data. As a result, multiple calls to methods such as `MySqlDataReader.GetValue` return a reference to the same object. Use caution if you are modifying the underlying value of the objects returned by methods such as `GetValue`.

Examples

The following example creates a `MySqlConnection`, a `MySqlCommand`, and a `MySqlDataReader`. The example reads through the data, writing it out to the console. Finally, the example closes the `MySqlDataReader`, then the `MySqlConnection`.

Visual Basic example:

```
Public Sub ReadMyData(myConnString As String)
```

```

Dim mySelectQuery As String = "SELECT OrderID, CustomerID FROM Orders"
Dim myConnection As New MySqlConnection(myConnString)
Dim myCommand As New MySqlCommand(mySelectQuery, myConnection)
myConnection.Open()
Dim myReader As MySqlDataReader
myReader = myCommand.ExecuteReader()
' Always call Read before accessing data.
While myReader.Read()
    Console.WriteLine((myReader.GetInt32(0) & ", " & myReader.GetString(1)))
End While
' always call Close when done reading.
myReader.Close()
' Close the connection when done with it.
myConnection.Close()
End Sub 'ReadMyData

```

C# example:

```

public void ReadMyData(string myConnString) {
    string mySelectQuery = "SELECT OrderID, CustomerID FROM Orders";
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    MySqlCommand myCommand = new MySqlCommand(mySelectQuery, myConnection);
    myConnection.Open();
    MySqlDataReader myReader;
    myReader = myCommand.ExecuteReader();
    // Always call Read before accessing data.
    while (myReader.Read()) {
        Console.WriteLine(myReader.GetInt32(0) + ", " + myReader.GetString(1));
    }
    // always call Close when done reading.
    myReader.Close();
    // Close the connection when done with it.
    myConnection.Close();
}

```

24.2.3.5.1. GetBytes

[getBytes](#) returns the number of available bytes in the field. In most cases this is the exact length of the field. However, the number returned may be less than the true length of the field if [getBytes](#) has already been used to obtain bytes from the field. This may be the case, for example, if the [MySqlDataReader](#) is reading a large data structure into a buffer. For more information, see the [SequentialAccess](#) setting for [MySqlCommand.CommandBehavior](#).

If you pass a buffer that is a null reference ([Nothing](#) in Visual Basic), [getBytes](#) returns the length of the field in bytes.

No conversions are performed; therefore the data retrieved must already be a byte array.

24.2.3.5.2. GetTimeSpan

Gets the value of the specified column as a [TimeSpan](#) object.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.3. GetDateTime

Gets the value of the specified column as a [System.DateTime](#) object.

Note

MySQL allows date columns to contain the value '0000-00-00' and datetime columns to contain the value '0000-00-00 00:00:00'. The [DateTime](#) structure cannot contain or represent these values. To read a datetime value from a column that might contain zero values, use [GetMySqlDateTime](#). The behavior of reading a zero datetime column using this method is defined by the [ZeroDateTimeBehavior](#) connection string option. For more information on this option, please refer to [MySqlConnection.ConnectionString](#).

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.4. GetMySqlDateTime

Gets the value of the specified column as a [MySql.Data.Types.MySqlDateTime](#) object.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.5. GetString

Gets the value of the specified column as a [String](#) object.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.6. GetDecimal

Gets the value of the specified column as a [Decimal](#) object.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.7. GetDouble

Gets the value of the specified column as a double-precision floating point number.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.8. GetFloat

Gets the value of the specified column as a single-precision floating point number.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.9. GetGuid

Gets the value of the specified column as a globally-unique identifier (GUID).

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.10. GetInt16

Gets the value of the specified column as a 16-bit signed integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.11. GetInt32

Gets the value of the specified column as a 32-bit signed integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.12. GetInt64

Gets the value of the specified column as a 64-bit signed integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.13. GetUInt16

Gets the value of the specified column as a 16-bit unsigned integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.14. GetUInt32

Gets the value of the specified column as a 32-bit unsigned integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.15. GetUInt64

Gets the value of the specified column as a 64-bit unsigned integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.6. Using [MySqlException](#)

This class is created whenever the MySQL Data Provider encounters an error generated from the server.

Any open connections are not automatically closed when an exception is thrown. If the client application determines that the exception is fatal, it should close any open [MySqlDataReader](#) objects or [MySqlConnection](#) objects.

Examples

The following example generates a [MySqlException](#) due to a missing server, and then displays the exception.

Visual Basic example:

```
Public Sub ShowException()
    Dim mySelectQuery As String = "SELECT column1 FROM table1"
    Dim myConnection As New MySqlConnection ("Data Source=localhost;Database=Sample;")
    Dim myCommand As New MySqlCommand(mySelectQuery, myConnection)
    Try
        myCommand.Connection.Open()
    Catch e As MySqlException
        MessageBox.Show( e.Message )
    End Try
End Sub
```

C# example:

```
public void ShowException()
{
    string mySelectQuery = "SELECT column1 FROM table1";
    MySqlConnection myConnection =
        new MySqlConnection("Data Source=localhost;Database=Sample;");
    MySqlCommand myCommand = new MySqlCommand(mySelectQuery, myConnection);
    try
    {
        myCommand.Connection.Open();
    }
    catch (MySqlException e)
    {
        MessageBox.Show( e.Message );
    }
}
```

24.2.3.7. Using [MySqlParameter](#)

Parameter names are not case sensitive.

Examples

The following example creates multiple instances of [MySqlParameter](#) through the [MySqlParameterCollection](#) collection within the [MySqlDataAdapter](#). These parameters are used to select data from the data source and place the data in the [DataSet](#). This example assumes that a [DataSet](#) and a [MySqlDataAdapter](#) have already been created with the appropriate schema, commands, and connection.

Visual Basic example:

```
Public Sub AddSqlParameters()
    ' ...
    ' create myDataSet and myDataAdapter
    ' ...
    myDataAdapter.SelectCommand.Parameters.Add("@CategoryName", MySqlDbType.VarChar, 80).Value = "toasters"
    myDataAdapter.SelectCommand.Parameters.Add("@SerialNum", MySqlDbType.Long).Value = 239

    myDataAdapter.Fill(myDataSet)
End Sub 'AddSqlParameters
```

C# example:

```
public void AddSqlParameters()
{
    // ...
    // create myDataSet and myDataAdapter
    // ...
    myDataAdapter.SelectCommand.Parameters.Add("@CategoryName", MySqlDbType.VarChar, 80).Value = "toasters";
    myDataAdapter.SelectCommand.Parameters.Add("@SerialNum", MySqlDbType.Long).Value = 239;
    myDataAdapter.Fill(myDataSet);
}
```

24.2.3.8. Using [MySQLParameterCollection](#)

The number of the parameters in the collection must be equal to the number of parameter placeholders within the command text, or an exception will be generated.

Examples

The following example creates multiple instances of [MySQLParameter](#) through the [MySQLParameterCollection](#) collection within the [MySQLDataAdapter](#). These parameters are used to select data within the data source and place the data in the [DataSet](#). This code assumes that a [DataSet](#) and a [MySQLDataAdapter](#) have already been created with the appropriate schema, commands, and connection.

Visual Basic example:

```
Public Sub AddParameters()
    ' ...
    ' create myDataSet and myDataAdapter
    ' ...
    myDataAdapter.SelectCommand.Parameters.Add("@CategoryName", MySqlDbType.VarChar, 80).Value = "toasters"
    myDataAdapter.SelectCommand.Parameters.Add("@SerialNum", MySqlDbType.Long).Value = 239

    myDataAdapter.Fill(myDataSet)
End Sub 'AddSqlParameters
```

C# example:

```
public void AddSqlParameters()
{
    // ...
    // create myDataSet and myDataAdapter
    // ...
    myDataAdapter.SelectCommand.Parameters.Add("@CategoryName", MySqlDbType.VarChar, 80).Value = "toasters";
    myDataAdapter.SelectCommand.Parameters.Add("@SerialNum", MySqlDbType.Long).Value = 239;
    myDataAdapter.Fill(myDataSet);
}
```

24.2.3.9. Using [MySQLTransaction](#)

Represents a SQL transaction to be made in a MySQL database. This class cannot be inherited.

The application creates a [MySQLTransaction](#) object by calling [MySQLConnection.BeginTransaction](#) on the [MySQLConnection](#) object. All subsequent operations associated with the transaction (for example, committing or aborting the transaction), are performed on the [MySQLTransaction](#) object.

Note

Once you have started a transaction on a connection all subsequent commands on that connection are applied within the scope of the transaction. You cannot execute an SQL statement on the same connection outside of the transaction scope. If you need to do this while executing statements that are part of a transaction, open a second a connection to be used for execution the non-transaction statements.

Examples

The following example creates a `MySqlConnection` and a `MySqlTransaction`. It also demonstrates how to use the `MySqlConnection.BeginTransaction`, `MySqlTransaction.Commit`, and `MySqlTransaction.Rollback` methods.

Visual Basic example:

```
Public Sub RunTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

    Dim myCommand As MySqlCommand = myConnection.CreateCommand()
    Dim myTrans As MySqlTransaction

    ' Start a local transaction
    myTrans = myConnection.BeginTransaction()
    ' Must assign both transaction object and connection
    ' to Command object for a pending local transaction
    myCommand.Connection = myConnection
    myCommand.Transaction = myTrans

    Try
        myCommand.CommandText = "Insert into Region (RegionID, RegionDescription) VALUES (100, 'Description')"
        myCommand.ExecuteNonQuery()
        myCommand.CommandText = "Insert into Region (RegionID, RegionDescription) VALUES (101, 'Description')"
        myCommand.ExecuteNonQuery()
        myTrans.Commit()
        Console.WriteLine("Both records are written to database.")
    Catch e As Exception
        Try
            myTrans.Rollback()
        Catch ex As MySqlException
            If Not myTrans.Connection Is Nothing Then
                Console.WriteLine("An exception of type " & ex.GetType().ToString() & _
                    " was encountered while attempting to roll back the transaction.")
            End If
        End Try
        Console.WriteLine("An exception of type " & e.GetType().ToString() & _
            " was encountered while inserting the data.")
        Console.WriteLine("Neither record was written to database.")
    Finally
        myConnection.Close()
    End Try
End Sub 'RunTransaction
```

C# example:

```
public void RunTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();
    MySqlTransaction myTrans;
    // Start a local transaction
    myTrans = myConnection.BeginTransaction();
    // Must assign both transaction object and connection
    // to Command object for a pending local transaction
    myCommand.Connection = myConnection;
    myCommand.Transaction = myTrans;
    try
    {
        myCommand.CommandText = "Insert into Region (RegionID, RegionDescription) VALUES (100, 'Description')";
        myCommand.ExecuteNonQuery();
        myCommand.CommandText = "Insert into Region (RegionID, RegionDescription) VALUES (101, 'Description')";
        myCommand.ExecuteNonQuery();
        myTrans.Commit();
        Console.WriteLine("Both records are written to database.");
    }
    catch(Exception e)
    {
        try
        {
            myTrans.Rollback();
        }
        catch (MySqlException ex)
        {
            if (myTrans.Connection != null)
            {
                Console.WriteLine("An exception of type " + ex.GetType() +
                    " was encountered while attempting to roll back the transaction.");
            }
        }
        Console.WriteLine("An exception of type " + e.GetType() +
            " was encountered while inserting the data.");
        Console.WriteLine("Neither record was written to database.");
    }
    finally
    {

```

```

        myConnection.Close();
    }
}

```

24.2.3.9.1. Rollback

Rolls back a transaction from a pending state.

The Rollback method is equivalent to the MySQL statement ROLLBACK. The transaction can only be rolled back from a pending state (after BeginTransaction has been called, but before Commit is called).

Examples

The following example creates [MySqlConnection](#) and [MySqlTransaction](#) . It also demonstrates how to use the [MySqlConnection.BeginTransaction](#) , [Commit](#) , and [Rollback](#) methods.

Visual Basic example:

```

Public Sub RunSqlTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

    Dim myCommand As MySqlCommand = myConnection.CreateCommand()
    Dim myTrans As MySqlTransaction

    ' Start a local transaction
    myTrans = myConnection.BeginTransaction()

    ' Must assign both transaction object and connection
    ' to Command object for a pending local transaction
    myCommand.Connection = myConnection
    myCommand.Transaction = myTrans

    Try
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (100, 'Description')"
        myCommand.ExecuteNonQuery()
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (101, 'Description')"
        myCommand.ExecuteNonQuery()
        myTrans.Commit()
        Console.WriteLine("Success.")
    Catch e As Exception
        Try
            myTrans.Rollback()
        Catch ex As MySqlException
            If Not myTrans.Connection Is Nothing Then
                Console.WriteLine("An exception of type " & ex.GetType().ToString() & _
                    " was encountered while attempting to roll back the transaction.")
            End If
        End Try

        Console.WriteLine("An exception of type " & e.GetType().ToString() & _
            "was encountered while inserting the data.")
        Console.WriteLine("Neither record was written to database.")
    Finally
        myConnection.Close()
    End Try
End Sub

```

C# example:

```

public void RunSqlTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();
    MySqlTransaction myTrans;
    // Start a local transaction
    myTrans = myConnection.BeginTransaction();
    // Must assign both transaction object and connection
    // to Command object for a pending local transaction
    myCommand.Connection = myConnection;
    myCommand.Transaction = myTrans;
    try
    {
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (100, 'Description)";
        myCommand.ExecuteNonQuery();
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (101, 'Description)";
        myCommand.ExecuteNonQuery();
        myTrans.Commit();
        Console.WriteLine("Both records are written to database.");
    }
    catch(Exception e)
    {
        try
        {
            myTrans.Rollback();
        }
    }
}

```

```

catch (MySqlException ex)
{
    if (myTrans.Connection != null)
    {
        Console.WriteLine("An exception of type " + ex.GetType() +
            " was encountered while attempting to roll back the transaction.");
    }
}

Console.WriteLine("An exception of type " + e.GetType() +
    " was encountered while inserting the data.");
Console.WriteLine("Neither record was written to database.");
}
finally
{
    myConnection.Close();
}
}

```

24.2.3.9.2. Commit

Commits the database transaction.

The `Commit` method is equivalent to the MySQL SQL statement COMMIT.

Examples

The following example creates `MySqlConnection` and a `MySqlTransaction`. It also demonstrates how to use the `MySqlConnection.BeginTransaction`, `Commit`, and `Rollback` methods.

Visual Basic example:

```

Public Sub RunSqlTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

    Dim myCommand As MySqlCommand = myConnection.CreateCommand()
    Dim myTrans As MySqlTransaction

    ' Start a local transaction
    myTrans = myConnection.BeginTransaction()

    ' Must assign both transaction object and connection
    ' to Command object for a pending local transaction
    myCommand.Connection = myConnection
    myCommand.Transaction = myTrans

    Try
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (100, 'Description')"
        myCommand.ExecuteNonQuery()
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (101, 'Description')"
        myCommand.ExecuteNonQuery()
        myTrans.Commit()
        Console.WriteLine("Success.")
    Catch e As Exception
        Try
            myTrans.Rollback()
        Catch ex As MySqlException
            If Not myTrans.Connection Is Nothing Then
                Console.WriteLine("An exception of type " & ex.GetType().ToString() & _
                    " was encountered while attempting to roll back the transaction.")
            End If
        End Try

        Console.WriteLine("An exception of type " & e.GetType().ToString() & _
            " was encountered while inserting the data.")
        Console.WriteLine("Neither record was written to database.")
    Finally
        myConnection.Close()
    End Try
End Sub

```

C# example:

```

public void RunSqlTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();
    MySqlTransaction myTrans;
    // Start a local transaction
    myTrans = myConnection.BeginTransaction();
    // Must assign both transaction object and connection
    // to Command object for a pending local transaction
    myCommand.Connection = myConnection;
    myCommand.Transaction = myTrans;
    try
    {
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (100, 'Description')";
    }
}

```

```

myCommand.ExecuteNonQuery();
myCommand.CommandText = "Insert into mytable (id, desc) VALUES (101, 'Description')";
myCommand.ExecuteNonQuery();
myTrans.Commit();
Console.WriteLine("Both records are written to database.");
}
catch(Exception e)
{
    try
    {
        myTrans.Rollback();
    }
    catch (MySqlException ex)
    {
        if (myTrans.Connection != null)
        {
            Console.WriteLine("An exception of type " + ex.GetType() +
                " was encountered while attempting to roll back the transaction.");
        }
    }

    Console.WriteLine("An exception of type " + e.GetType() +
        " was encountered while inserting the data.");
    Console.WriteLine("Neither record was written to database.");
}
finally
{
    myConnection.Close();
}
}

```

24.2.4. Connector/NET Reference

This section of the manual contains a complete reference to the Connector/NET ADO.NET component, automatically generated from the embedded documentation.

24.2.4.1. `MySql.Data.MySqlClient`

[Namespaces hierarchy](#)

Classes

Class	Description
MySqlCommand	
MySqlCommandBuilder	
MySqlConnection	
MySqlDataAdapter	
MySqlDataReader	Provides a means of reading a forward-only stream of rows from a MySQL database. This class cannot be inherited.
MySqlError	Collection of error codes that can be returned by the server
MySqlException	The exception that is thrown when MySQL returns an error. This class cannot be inherited.
MySqlHelper	Helper class that makes it easier to work with the provider.
MySqlInfoMessageEventArgs	Provides data for the InfoMessage event. This class cannot be inherited.
MySqlParameter	Represents a parameter to a MySqlCommand , and optionally, its mapping to DataSet columns. This class cannot be inherited.
MySqlParameterCollection	Represents a collection of parameters relevant to a MySqlCommand as well as their respective mappings to columns in a DataSet. This class cannot be inherited.
MySqlRowUpdatedEventArgs	Provides data for the RowUpdated event. This class cannot be inherited.
MySqlRowUpdatingEventArgs	Provides data for the RowUpdating event. This class cannot be inherited.
MySqlTransaction	

Delegates

Delegate	Description
----------	-------------

MySqlInfoMessageEventHandler	Represents the method that will handle the InfoMessage event of a MySqlConnection .
MySqlRowUpdatedEventHandler	Represents the method that will handle the RowUpdatedevent of a MySqlDataAdapter .
MySqlRowUpdatingEventHandler	Represents the method that will handle the RowUpdatingevent of a MySqlDataAdapter .

Enumerations

Enumeration	Description
MySqlDbType	Specifies MySQL specific data type of a field, property, for use in a MySqlParameter .
MySqlErrorCode

[MySqlCommand overview](#)

Public Instance Constructors

MySqlCommand	Overloaded. Initializes a new instance of the MySqlCommand class.
------------------------------	---

Public Instance Properties

CommandText	
CommandTimeout	
CommandType	

Connection	
Container(inherited from Component)	Gets the IContainerthat contains the Component.
IsPrepared	
Parameters	
Site(inherited from Component)	Gets or sets the ISiteof the Component.
Transaction	
UpdatedRowSource	

Public Instance Methods

Cancel	Attempts to cancel the execution of a MySqlCommand. This operation is not supported.
CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
CreateParameter	Creates a new instance of a MySqlParameter object.
Dispose(inherited from Component)	Releases all resources used by the Component.
Equals(inherited from Object)	Determines whether the specified Objectis equal to the current Object.
ExecuteNonQuery	
ExecuteReader	Overloaded.
ExecuteScalar	
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCodeis suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Typeof the current instance.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
Prepare	
ToString(inherited from Component)	Returns a Stringcontaining the name of the Component, if any. This method should not be overridden.

Public Instance Events

Disposed(inherited from Component)	Adds an event handler to listen to the Disposedevent on the component.
------------------------------------	--

24.2.4.1.2.1.1.3.1.1.10.1.1.1. [MySQLTransaction Members](#)

[MySQLTransaction overview](#)

Public Instance Properties

Connection	Gets the MySQLConnection object associated with the transaction, or a null reference (Nothing in Visual Basic) if the transaction is no longer valid.
----------------------------	---

IsolationLevel	Specifies the IsolationLevel for this transaction.
--------------------------------	--

Public Instance Methods

Commit	
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
Rollback	
ToString(inherited from Object)	Returns a String that represents the current Object.

[MySQLTransaction Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.1.3.1.1.10.1.1.1.1. Connection Property

Gets the [MySQLConnection](#) object associated with the transaction, or a null reference (Nothing in Visual Basic) if the transaction is no longer valid.

Syntax: Visual Basic

```
Public ReadOnly Property Connection As MySqlConnection
```

Syntax: C#

```
public MySqlConnection Connection {get;}
```

Property Value

The [MySQLConnection](#) object associated with this transaction.

Remarks

A single application may have multiple database connections, each with zero or more transactions. This property enables you to determine the connection object associated with a particular transaction created by [BeginTransaction](#) .

See Also

[MySQLTransaction Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.1.3.1.1.10.1.1.1.2. IsolationLevel Property

Specifies the IsolationLevel for this transaction.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property IsolationLevel As IsolationLevel _  
_ Implements IDbTransaction.IsolationLevel
```

Syntax: C#

```
public System.Data.IsolationLevel IsolationLevel {get;}
```

Property Value

The IsolationLevel for this transaction. The default is ReadCommitted.

Implements

IDbTransaction.IsolationLevel

Remarks

Parallel transactions are not supported. Therefore, the IsolationLevel applies to the entire transaction.

Public Instance Constructors

MySqlInfoMessageEventArgs Constructor	Initializes a new instance of the MySqlInfoMessageEventArgs class.
---	--

Public Instance Fields

errors	
------------------------	--

Public Instance Methods

Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
ToString(inherited from Object)	Returns a String that represents the current Object.

Protected Instance Methods

Finalize(inherited from Object)	Allows an Object to attempt to free resources and perform other cleanup operations before the Object is reclaimed by garbage collection.
MemberwiseClone(inherited from Object)	Creates a shallow copy of the current Object.

[MySqlInfoMessageEventArgs Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.1.3.1.1.16.1.1.1.2.1. [MySqlError](#) Class

Collection of error codes that can be returned by the server

For a list of all members of this type, see [MySqlError Members](#) .

Syntax: Visual Basic

```
Public Class MySqlError
```

Syntax: C#

```
public class MySqlError
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

See Also

[MySqlError Members](#) , [MySql.Data.MySqlClient Namespace](#)

[MySqlError overview](#)

Public Instance Constructors

MySqlError Constructor	
--	--

Public Instance Properties

Code	Error code
Level	Error level
Message	Error message

Public Instance Methods

Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
ToString(inherited from Object)	Returns a String that represents the current Object.

Protected Instance Methods

Finalize(inherited from Object)	Allows an Object to attempt to free resources and perform other cleanup operations before the Object is reclaimed by garbage collection.
MemberwiseClone(inherited from Object)	Creates a shallow copy of the current Object.

Syntax: C#

```
public MySqlParameterCollection Parameters {get;}
```

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1. [MySqlParameterCollection](#) Class

Represents a collection of parameters relevant to a [MySQLCommand](#) as well as their respective mappings to columns in a DataSet. This class cannot be inherited.

For a list of all members of this type, see [MySqlParameterCollection Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySqlParameterCollection_
    Inherits MarshalByRefObject_
    Implements IDataParameterCollection, IList, ICollection, IEnumerable
```

Syntax: C#

```
public sealed class MySqlParameterCollection : MarshalByRefObject, IDataParameterCollection, IList, ICollection, IEnumerable
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

[MySqlParameterCollection overview](#)

Public Instance Constructors

MySQLParameterCollection Constructor	Initializes a new instance of the MySQLParameterCollection class.
--	---

Public Instance Properties

Count	Gets the number of MySQLParameter objects in the collection.
Item	Overloaded. Gets the MySQLParameter with a specified attribute. In C#, this property is the indexer for the MySQLParameterCollection class.

Public Instance Methods

Add	Overloaded. Adds the specified MySQLParameter object to the MySQLParameterCollection .
Clear	Removes all items from the collection.
Contains	Overloaded. Gets a value indicating whether a MySQLParameter exists in the collection.
CopyTo	Copies MySQLParameter objects from the MySQLParameterCollection to the specified array.
CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Type of the current instance.
IndexOf	Overloaded. Gets the location of a MySQLParameter in the collection.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
Insert	Inserts a MySQLParameter into the collection at the specified index.
Remove	Removes the specified MySQLParameter from the collection.
RemoveAt	Overloaded. Removes the specified MySQLParameter from the collection.
ToString(inherited from Object)	Returns a String that represents the current Object.

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.1. MySQLParameterCollection Constructor

Initializes a new instance of the [MySQLParameterCollection](#) class.

Syntax: Visual Basic

```
Public Sub New()
```

Syntax: C#

```
public MySQLParameterCollection();
```

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.2. Count Property

Gets the number of [MySQLParameter](#) objects in the collection.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property Count As Integer _
    Implements ICollection.Count
```

Syntax: C#

```
public int Count {get;}
```

Implements

[ICollection.Count](#)

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3. Item Property

Gets the [MySQLParameter](#) with a specified attribute. In C#, this property is the indexer for the [MySQLParameterCollection](#) class.

Overload List

Gets the [MySQLParameter](#) at the specified index.

- `public MySQLParameter this[int] {get; set;}`

Gets the [MySQLParameter](#) with the specified name.

- `public MySQLParameter this[string] {get; set;}`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1. MySQLParameter Class

Represents a parameter to a [MySQLCommand](#) , and optionally, its mapping to [DataSetColumns](#). This class cannot be inherited.

For a list of all members of this type, see [MySQLParameter Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySQLParameter_
    Inherits MarshalByRefObject_
    Implements IDataParameter, IDbDataParameter, ICloneable
```

Syntax: C#

```
public sealed class MySQLParameter : MarshalByRefObject, IDataParameter, IDbDataParameter, ICloneable
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

[MySqlParameter overview](#)

Public Instance Constructors

MySqlParameter	Overloaded. Initializes a new instance of the MySqlParameter class.
--------------------------------	---

Public Instance Properties

DbType	Gets or sets the DbType of the parameter.
Direction	Gets or sets a value indicating whether the parameter is input-only, output-only, bidirectional, or a stored procedure return value parameter. As of MySQL version 4.1 and earlier, input-only is the only valid choice.
IsNullable	Gets or sets a value indicating whether the parameter accepts null values.
IsUnsigned	
MySqlDbType	Gets or sets the MySqlDbType of the parameter.
ParameterName	Gets or sets the name of the MySqlParameter .
Precision	Gets or sets the maximum number of digits used to represent the Value property.
Scale	Gets or sets the number of decimal places to which Value is resolved.
Size	Gets or sets the maximum size, in bytes, of the data within the column.
SourceColumn	Gets or sets the name of the source column that is mapped to the DataSet and used for loading or returning the Value .
SourceVersion	Gets or sets the DataRowVersion to use when loading Value .
Value	Gets or sets the value of the parameter.

Public Instance Methods

CreateObjRef (inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Equals (inherited from Object)	Determines whether the specified Object is equal to the current Object .
GetHashCode (inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService (inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType (inherited from Object)	Gets the Type of the current instance.
InitializeLifetimeService (inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
ToString	Overridden. Gets a string containing the ParameterName .

24.2.4.1.2.1.7.1.1.3.1.1.1. [MySQLParameter](#) Constructor

Initializes a new instance of the [MySQLParameter](#) class.

Overload List

Initializes a new instance of the [MySQLParameter](#) class.

- [public MySQLParameter\(\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name and the data type.

- [public MySQLParameter\(string,MySQLDbType\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the [MySQLDbType](#) , and the size.

- [public MySQLParameter\(string,MySQLDbType,int\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the type of the parameter, the size of the parameter, a [ParameterDirection](#), the precision of the parameter, the scale of the parameter, the source column, a [DataRowVersion](#) to use, and the value of the parameter.

- [public MySQLParameter\(string,MySQLDbType,int,ParameterDirection,bool,byte,byte,string,DataRowVersion,object\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the [MySQLDbType](#) , the size, and the source column name.

- [public MySQLParameter\(string,MySQLDbType,int,string\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name and a value of the new [MySQLParameter](#).

- [public MySQLParameter\(string,object\);](#)

24.2.4.1.2.1.7.1.1.3.1.1.1.2.1. [MySqlDbType](#) Enumeration

Specifies MySQL specific data type of a field, property, for use in a [MySqlParameter](#) .

Syntax: Visual Basic

```
Public Enum MySqlDbType
```

Syntax: C#

```
public enum MySqlDbType
```

Members

Member Name	Description
VarChar	A variable-length string containing 0 to 65535 characters
Timestamp	A timestamp. The range is '1970-01-01 00:00:01' to sometime in the year 2038
LongBlob	A BLOB column with a maximum length of 4294967295 or 4G (2 ³² - 1) characters
Time	The range is '-838:59:59' to '838:59:59'.
TinyBlob	A BLOB column with a maximum length of 255 (2 ⁸ - 1) characters
Datetime	The supported range is '1000-01-01 00:00:00' to '9999-12-31 23:59:59'.
Decimal	A fixed precision and scale numeric value between -1038 -1 and 1038 -1.
UByte	
Blob	A BLOB column with a maximum length of 65535 (2 ¹⁶ - 1) characters
Double	A normal-size (double-precision) floating-point number. Allowable values are -1.7976931348623157E+308 to -2.2250738585072014E-308, 0, and 2.2250738585072014E-308 to 1.7976931348623157E+308.
Newdate	Obsolete Use Datetime or Date type
Byte	The signed range is -128 to 127. The unsigned range is 0 to 255.
Date	Date The supported range is '1000-01-01' to '9999-12-31'.

VarChar	A variable-length string containing 0 to 255 characters
UInt16	
UInt24	
Int16	A 16-bit signed integer. The signed range is -32768 to 32767. The unsigned range is 0 to 65535
NewDecimal	New Decimal
Set	A set. A string object that can have zero or more values, each of which must be chosen from the list of values 'value1', 'value2', ... A SET can have a maximum of 64 members.
String	Obsolete Use VarChar type
Enum	An enumeration. A string object that can have only one value, chosen from the list of values 'value1', 'value2', ..., NULL or the special "" error value. An ENUM can have a maximum of 65535 distinct values
Geometry	
UInt64	
Int64	A 64-bit signed integer.
UInt32	
Int24	Specifies a 24 (3 byte) signed or unsigned value.
Bit	Bit-field data type
Float	A small (single-precision) floating-point number. Allowable values are -3.402823466E+38 to -1.175494351E-38, 0, and 1.175494351E-38 to 3.402823466E+38.
Year	A year in 2- or 4-digit format (default is 4-digit). The allowable values are 1901 to 2155, 0000 in the 4-digit year format, and 1970-2069 if you use the 2-digit format (70-69)
Int32	A 32-bit signed integer
MediumBlob	A BLOB column with a maximum length of 16777215 (2 ²⁴ - 1) characters

Requirements

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

See Also

[MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.3. [MySQLParameter](#) Constructor (String, MySqlDbType, Int32)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the [MySqlDbType](#) , and the size.

Syntax: Visual Basic

```
Overloads Public Sub New( _
    ByVal parameterName As String, _
    ByVal dbType As MySqlDbType, _
    ByVal size As Integer _
)
```

Syntax: C#

```
public MySQLParameter(
    string parameterName,
    MySqlDbType dbType,
    int size
);
```

Parameters

- `parameterName`: The name of the parameter to map.
- `dbType`: One of the [MySQLDbType](#) values.
- `size`: The length of the parameter.

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameter Constructor Overload List](#)

24.2.4.1.2.1.7.1.1.3.1.1.4. [MySQLParameter](#) Constructor

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the type of the parameter, the size of the parameter, a [ParameterDirection](#), the precision of the parameter, the scale of the parameter, the source column, a [DataRowVersion](#) to use, and the value of the parameter.

Syntax: Visual Basic

```
Overloads Public Sub New( _
    ByVal parameterName As String, _
    ByVal dbType As MySQLDbType, _
    ByVal size As Integer, _
    ByVal direction As ParameterDirection, _
    ByVal isNullable As Boolean, _
    ByVal precision As Byte, _
    ByVal scale As Byte, _
    ByVal sourceColumn As String, _
    ByVal sourceVersion As DataRowVersion, _
    ByVal value As Object _
)
```

Syntax: C#

```
public MySQLParameter(
    string parameterName,
    MySQLDbType dbType,
    int size,
    ParameterDirection direction,
    bool isNullable,
    byte precision,
    byte scale,
    string sourceColumn,
    DataRowVersion sourceVersion,
    object value
);
```

Parameters

- `parameterName`: The name of the parameter to map.
- `dbType`: One of the [MySQLDbType](#) values.
- `size`: The length of the parameter.
- `direction`: One of the [ParameterDirection](#) values.
- `isNullable`: true if the value of the field can be null, otherwise false.
- `precision`: The total number of digits to the left and right of the decimal point to which [Value](#) is resolved.
- `scale`: The total number of decimal places to which [Value](#) is resolved.
- `sourceColumn`: The name of the source column.
- `sourceVersion`: One of the [DataRowVersion](#) values.
- `value`: An [Object](#) that is the value of the [MySQLParameter](#) .

Exceptions

Exception Type	Condition

24.2.4.1.2.1.7.1.1.3.1.1.5. MySQLParameter Constructor

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the [MySQLDbType](#) , the size, and the source column name.

Syntax: Visual Basic

```
Overloads Public Sub New( _
    ByVal parameterName As String, _
    ByVal dbType As MySQLDbType, _
    ByVal size As Integer, _
    ByVal sourceColumn As String _
)
```

Syntax: C#

```
public MySQLParameter(
    stringparameterName,
    MySQLDbTypedbType,
    intsize,
    stringsourceColumn
);
```

Parameters

- [parameterName](#): The name of the parameter to map.
- [dbType](#): One of the [MySQLDbType](#) values.
- [size](#): The length of the parameter.
- [sourceColumn](#): The name of the source column.

24.2.4.1.2.1.7.1.1.3.1.1.6. MySQLParameter Constructor

Initializes a new instance of the [MySQLParameter](#) class with the parameter name and a value of the new MySQLParameter.

Syntax: Visual Basic

```
Overloads Public Sub New( _
    ByVal parameterName As String, _
    ByVal value As Object _
)
```

Syntax: C#

```
public MySqlParameter(
    string parameterName,
    object value
);
```

Parameters

- `parameterName`: The name of the parameter to map.
- `value`: An Object that is the value of the [MySqlParameter](#).

24.2.4.1.2.1.7.1.1.3.1.1.2. DbType Property

Gets or sets the DbType of the parameter.

Syntax: Visual Basic

```
NotOverridable Public Property DbType As DbType _
    Implements IDataParameter.DbType
```

Syntax: C#

```
public System.Data.DbType DbType {get; set;}
```

Implements

IDataParameter.DbType

See Also

[MySqlParameter Class](#), [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.3. Direction Property

Gets or sets a value indicating whether the parameter is input-only, output-only, bidirectional, or a stored procedure return value parameter. As of MySQL version 4.1 and earlier, input-only is the only valid choice.

Syntax: Visual Basic

```
NotOverridable Public Property Direction As ParameterDirection _
    Implements IDataParameter.Direction
```

Syntax: C#

```
public System.Data.ParameterDirection Direction {get; set;}
```

Implements

IDataParameter.Direction

See Also

[MySqlParameter Class](#), [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.4. IsNullable Property

Gets or sets a value indicating whether the parameter accepts null values.

Syntax: Visual Basic

```
NotOverridable Public Property IsNullable As Boolean _  
    Implements IDataParameter.IsNullable
```

Syntax: C#

```
public bool IsNullable {get; set;}
```

Implements

IDataParameter.IsNullable

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.5. IsUnsigned Property

Syntax: Visual Basic

```
Public Property IsUnsigned As Boolean
```

Syntax: C#

```
public bool IsUnsigned {get; set;}
```

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.6. MySQLDbType Property

Gets or sets the MySQLDbType of the parameter.

Syntax: Visual Basic

```
Public Property MySQLDbType As MySQLDbType
```

Syntax: C#

```
public MySQLDbType MySQLDbType {get; set;}
```

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.7. ParameterName Property

Gets or sets the name of the MySQLParameter.

Syntax: Visual Basic

```
NotOverridable Public Property ParameterName As String _  
    Implements IDataParameter.ParameterName
```

Syntax: C#

```
public string ParameterName {get; set;}
```

Implements

IDataParameter.ParameterName

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.8. Precision Property

Gets or sets the maximum number of digits used to represent the [Value](#) property.

Syntax: Visual Basic

```
NotOverridable Public Property Precision As Byte _  
- Implements IDbDataParameter.Precision
```

Syntax: C#

```
public byte Precision {get; set;}
```

Implements

IDbDataParameter.Precision

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.9. Scale Property

Gets or sets the number of decimal places to which [Value](#) is resolved.

Syntax: Visual Basic

```
NotOverridable Public Property Scale As Byte _  
- Implements IDbDataParameter.Scale
```

Syntax: C#

```
public byte Scale {get; set;}
```

Implements

IDbDataParameter.Scale

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.10. Size Property

Gets or sets the maximum size, in bytes, of the data within the column.

Syntax: Visual Basic

```
NotOverridable Public Property Size As Integer _  
- Implements IDbDataParameter.Size
```

Syntax: C#

```
public int Size {get; set;}
```

Implements

IDbDataParameter.Size

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.11. SourceColumn Property

Gets or sets the name of the source column that is mapped to the DataSet and used for loading or returning the [Value](#) .

Syntax: Visual Basic

```
NotOverridable Public Property SourceColumn As String _  
- Implements IDataParameter.SourceColumn
```

Syntax: C#

```
public string SourceColumn {get; set;}
```

Implements

IDataParameter.SourceColumn

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.12. SourceVersion Property

Gets or sets the DataRowVersion to use when loading [Value](#) .

Syntax: Visual Basic

```
NotOverridable Public Property SourceVersion As DataRowVersion _  
- Implements IDataParameter.SourceVersion
```

Syntax: C#

```
public System.Data.DataRowVersion SourceVersion {get; set;}
```

Implements

IDataParameter.SourceVersion

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.13. MySQLParameter.ToString Method

Overridden. Gets a string containing the [ParameterName](#) .

Syntax: Visual Basic

```
Overrides Public Function ToString() As String
```

Syntax: C#

```
public override string ToString();
```

Return Value

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.2. Item Property (Int32)

Gets the [MySQLParameter](#) at the specified index.

Syntax: Visual Basic

```
Overloads Public Default Property Item( _  
ByVal index As Integer _  
) As MySQLParameter
```

Syntax: C#

```
public MySqlParameter this[
    int index
] {get; set;}
```

See Also

[MySqlParameterCollection Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlParameterCollection.Item Overload List](#)

24.2.4.1.2.1.7.1.1.3.3. Item Property (String)

Gets the [MySqlParameter](#) with the specified name.

Syntax: Visual Basic

```
Overloads Public Default Property Item( _
    ByVal name As String _
) As MySqlParameter
```

Syntax: C#

```
public MySqlParameter this[
    string name
] {get; set;}
```

See Also

[MySqlParameterCollection Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlParameterCollection.Item Overload List](#)

24.2.4.1.2.1.7.1.1.4. Add Method

Adds the specified [MySqlParameter](#) object to the [MySqlParameterCollection](#) .

Overload List

Adds the specified [MySqlParameter](#) object to the [MySqlParameterCollection](#) .

- [public MySqlParameter Add\(MySqlParameter\);](#)

Adds the specified [MySqlParameter](#) object to the [MySqlParameterCollection](#) .

- [public int Add\(object\);](#)

Adds a [MySqlParameter](#) to the [MySqlParameterCollection](#) given the parameter name and the data type.

- [public MySqlParameter Add\(string, MySqlDbType\);](#)

Adds a [MySqlParameter](#) to the [MySqlParameterCollection](#) with the parameter name, the data type, and the column length.

- [public MySqlParameter Add\(string, MySqlDbType, int\);](#)

Adds a [MySqlParameter](#) to the [MySqlParameterCollection](#) with the parameter name, the data type, the column length, and the source column name.

- [public MySqlParameter Add\(string, MySqlDbType, int, string\);](#)

Adds a [MySqlParameter](#) to the [MySqlParameterCollection](#) given the specified parameter name and value.

- [public MySqlParameter Add\(string, object\);](#)

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.4.1. [MySQLParameterCollection.Add](#) Method

Adds the specified [MySQLParameter](#) object to the [MySQLParameterCollection](#) .

Syntax: Visual Basic

```
Overloads Public Function Add( _
    ByVal value As MySQLParameter _
) As MySQLParameter
```

Syntax: C#

```
public MySQLParameter Add(
    MySQLParametervalue
);
```

Parameters

- **value:** The [MySQLParameter](#) to add to the collection.

Return Value

The newly added [MySQLParameter](#) object.

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Add Overload List](#)

24.2.4.1.2.1.7.1.1.4.2. [MySQLParameterCollection.Add](#) Method

Adds the specified [MySQLParameter](#) object to the [MySQLParameterCollection](#) .

Syntax: Visual Basic

```
NotOverridable Overloads Public Function Add( _
    ByVal value As Object _
) As Integer _
    Implements IList.Add
```

Syntax: C#

```
public int Add(
    objectvalue
);
```

Parameters

- **value:** The [MySQLParameter](#) to add to the collection.

Return Value

The index of the new [MySQLParameter](#) object.

Implements

IList.Add

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Add Overload List](#)

24.2.4.1.2.1.7.1.1.4.3. [MySQLParameterCollection.Add](#) Method

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) given the parameter name and the data type.

Syntax: Visual Basic

```
Overloads Public Function Add( _
    ByVal parameterName As String, _
    ByVal dbType As MySqlDbType _
) As MySqlParameter
```

Syntax: C#

```
public MySqlParameter Add(
    stringparameterName,
    MySqlDbTypedbType
);
```

Parameters

- `parameterName`: The name of the parameter.
- `dbType`: One of the `MySqlDbType` values.

Return Value

The newly added `MySqlParameter` object.

See Also

[MySqlParameterCollection Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlParameterCollection.Add Overload List](#)

24.2.4.1.2.1.7.1.1.4.4. `MySqlParameterCollection.Add` Method

Adds a `MySqlParameter` to the `MySqlParameterCollection` with the parameter name, the data type, and the column length.

Syntax: Visual Basic

```
Overloads Public Function Add( _
    ByVal parameterName As String, _
    ByVal dbType As MySqlDbType, _
    ByVal size As Integer _
) As MySqlParameter
```

Syntax: C#

```
public MySqlParameter Add(
    stringparameterName,
    MySqlDbTypedbType,
    intsize
);
```

Parameters

- `parameterName`: The name of the parameter.
- `dbType`: One of the `MySqlDbType` values.
- `size`: The length of the column.

Return Value

The newly added `MySqlParameter` object.

See Also

[MySqlParameterCollection Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlParameterCollection.Add Overload List](#)

24.2.4.1.2.1.7.1.1.4.5. `MySqlParameterCollection.Add` Method

Adds a `MySqlParameter` to the `MySqlParameterCollection` with the parameter name, the data type, the column length, and the source column name.

Syntax: Visual Basic

```
Overloads Public Function Add( _  
    ByVal parameterName As String, _  
    ByVal dbType As MySqlDbType, _  
    ByVal size As Integer, _  
    ByVal sourceColumn As String _  
) As MySqlParameter
```

Syntax: C#

```
public MySqlParameter Add(  
    stringparameterName,  
    MySqlDbTypedbType,  
    intsize,  
    stringsourceColumn  
);
```

Parameters

- `parameterName`: The name of the parameter.
- `dbType`: One of the [MySqlDbType](#) values.
- `size`: The length of the column.
- `sourceColumn`: The name of the source column.

Return Value

The newly added [MySqlParameter](#) object.

See Also

[MySqlParameterCollection Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlParameterCollection.Add Overload List](#)

24.2.4.1.2.1.7.1.1.4.6. [MySqlParameterCollection.Add](#) Method

Adds a [MySqlParameter](#) to the [MySqlParameterCollection](#) given the specified parameter name and value.

Syntax: Visual Basic

```
Overloads Public Function Add( _  
    ByVal parameterName As String, _  
    ByVal value As Object _  
) As MySqlParameter
```

Syntax: C#

```
public MySqlParameter Add(  
    stringparameterName,  
    objectvalue  
);
```

Parameters

- `parameterName`: The name of the parameter.
- `value`: The [Value](#) of the [MySqlParameter](#) to add to the collection.

Return Value

The newly added [MySqlParameter](#) object.

See Also

[MySqlParameterCollection Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlParameterCollection.Add Overload List](#)

24.2.4.1.2.1.7.1.1.5. [MySqlParameterCollection.Clear](#) Method

Removes all items from the collection.

Syntax: Visual Basic

```
NotOverridable Public Sub Clear() _  
    Implements IList.Clear
```

Syntax: C#

```
public void Clear();
```

Implements

IList.Clear

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.6. Contains Method

Gets a value indicating whether a [MySQLParameter](#) exists in the collection.

Overload List

Gets a value indicating whether a [MySQLParameter](#) exists in the collection.

- `public bool Contains(object);`

Gets a value indicating whether a [MySQLParameter](#) with the specified parameter name exists in the collection.

- `public bool Contains(string);`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.6.1. MySQLParameterCollection.Contains Method

Gets a value indicating whether a [MySQLParameter](#) exists in the collection.

Syntax: Visual Basic

```
NotOverridable Overloads Public Function Contains( _  
    ByVal value As Object _  
) As Boolean _  
    Implements IList.Contains
```

Syntax: C#

```
public bool Contains(  
    objectvalue  
);
```

Parameters

- `value`: The value of the [MySQLParameter](#) object to find.

Return Value

true if the collection contains the [MySQLParameter](#) object; otherwise, false.

Implements

IList.Contains

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Contains Overload List](#)

24.2.4.1.2.1.7.1.1.6.2. [MySQLParameterCollection.Contains](#) Method

Gets a value indicating whether a [MySQLParameter](#) with the specified parameter name exists in the collection.

Syntax: Visual Basic

```
NotOverridable Overloads Public Function Contains( _
    ByVal name As String _
) As Boolean _
- Implements IDataParameterCollection.Contains
```

Syntax: C#

```
public bool Contains(
    stringname
);
```

Parameters

- **name**: The name of the [MySQLParameter](#) object to find.

Return Value

true if the collection contains the parameter; otherwise, false.

Implements

[IDataParameterCollection.Contains](#)

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Contains Overload List](#)

24.2.4.1.2.1.7.1.1.7. [MySQLParameterCollection.CopyTo](#) Method

Copies [MySQLParameter](#) objects from the [MySQLParameterCollection](#) to the specified array.

Syntax: Visual Basic

```
NotOverridable Public Sub CopyTo( _
    ByVal array As Array, _
    ByVal index As Integer _
) _
- Implements ICollection.CopyTo
```

Syntax: C#

```
public void CopyTo(
    Arrayarray,
    intindex
);
```

Parameters

- **array**:
- **index**:

Implements

[ICollection.CopyTo](#)

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.8. IndexOf Method

Gets the location of a [MySQLParameter](#) in the collection.

Overload List

Gets the location of a [MySQLParameter](#) in the collection.

- `public int IndexOf(object);`

Gets the location of the [MySQLParameter](#) in the collection with a specific parameter name.

- `public int IndexOf(string);`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.8.1. [MySQLParameterCollection.IndexOf](#) Method

Gets the location of a [MySQLParameter](#) in the collection.

Syntax: Visual Basic

```
NotOverridable Overloads Public Function IndexOf( _  
    ByVal value As Object _  
) As Integer _  
- Implements IList.IndexOf
```

Syntax: C#

```
public int IndexOf(  
    objectvalue  
);
```

Parameters

- `value`: The [MySQLParameter](#) object to locate.

Return Value

The zero-based location of the [MySQLParameter](#) in the collection.

Implements

[IList.IndexOf](#)

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.IndexOf Overload List](#)

24.2.4.1.2.1.7.1.1.8.2. [MySQLParameterCollection.IndexOf](#) Method

Gets the location of the [MySQLParameter](#) in the collection with a specific parameter name.

Syntax: Visual Basic

```
NotOverridable Overloads Public Function IndexOf( _  
    ByVal parameterName As String _  
) As Integer _  
- Implements IDataParameterCollection.IndexOf
```

Syntax: C#

```
public int IndexOf(  
string parameterName  
);
```

Parameters

- `parameterName`: The name of the [MySQLParameter](#) object to retrieve.

Return Value

The zero-based location of the [MySQLParameter](#) in the collection.

Implements

[IDataParameterCollection.IndexOf](#)

See Also

[MySQLParameterCollection Class](#), [MySQL.Data.MySqlClient Namespace](#), [MySQLParameterCollection.IndexOf Overload List](#)

24.2.4.1.2.1.7.1.1.9. [MySQLParameterCollection.Insert](#) Method

Inserts a [MySQLParameter](#) into the collection at the specified index.

Syntax: Visual Basic

```
NotOverridable Public Sub Insert( _  
    ByVal index As Integer, _  
    ByVal value As Object _  
) _  
- Implements IList.Insert
```

Syntax: C#

```
public void Insert(  
int index,  
object value  
);
```

Parameters

- `index`:
- `value`:

Implements

[IList.Insert](#)

See Also

[MySQLParameterCollection Class](#), [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.10. [MySQLParameterCollection.Remove](#) Method

Removes the specified [MySQLParameter](#) from the collection.

Syntax: Visual Basic

```
NotOverridable Public Sub Remove( _  
    ByVal value As Object _  
) _  
- Implements IList.Remove
```

Syntax: C#

```
public void Remove(  
object value  
);
```

Parameters

- `value`:

Implements

`IList.Remove`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.11. RemoveAt Method

Removes the specified [MySQLParameter](#) from the collection.

Overload List

Removes the specified [MySQLParameter](#) from the collection using a specific index.

- `public void RemoveAt(int);`

Removes the specified [MySQLParameter](#) from the collection using the parameter name.

- `public void RemoveAt(string);`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.11.1. MySQLParameterCollection.RemoveAt Method

Removes the specified [MySQLParameter](#) from the collection using a specific index.

Syntax: Visual Basic

```
NotOverridable Overloads Public Sub RemoveAt( _  
    ByVal index As Integer _  
) _  
- Implements IList.RemoveAt
```

Syntax: C#

```
public void RemoveAt(  
    int index  
);
```

Parameters

- `index`: The zero-based index of the parameter.

Implements

`IList.RemoveAt`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.RemoveAt Overload List](#)

24.2.4.1.2.1.7.1.1.11.2. MySQLParameterCollection.RemoveAt Method

Removes the specified [MySQLParameter](#) from the collection using the parameter name.

Syntax: Visual Basic

```
NotOverridable Overloads Public Sub RemoveAt( _  
    ByVal name As String _  
) _  
- Implements IDataParameterCollection.RemoveAt
```

Syntax: C#

```
public void RemoveAt(  
    string name  
);
```

Parameters

- **name**: The name of the [MySQLParameter](#) object to retrieve.

Implements

[IDataParameterCollection.RemoveAt](#)

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.RemoveAt Overload List](#)

24.2.4.1.2.1.8. Transaction Property

Syntax: Visual Basic

```
Public Property Transaction As MySQLTransaction
```

Syntax: C#

```
public MySQLTransaction Transaction {get; set;}
```

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.9. UpdatedRowSource Property

Syntax: Visual Basic

```
NotOverridable Public Property UpdatedRowSource As UpdateRowSource _  
- Implements IDbCommand.UpdatedRowSource
```

Syntax: C#

```
public System.Data.UpdateRowSource UpdatedRowSource {get; set;}
```

Implements

[IDbCommand.UpdatedRowSource](#)

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.10. MySQLCommand.Cancel Method

Attempts to cancel the execution of a [MySQLCommand](#). This operation is not supported.

Syntax: Visual Basic

```
NotOverridable Public Sub Cancel() _  
- Implements IDbCommand.Cancel
```

Syntax: C#

```
public void Cancel();
```

Implements

IDbCommand.Cancel

Remarks

Cancelling an executing command is currently not supported on any version of MySQL.

Exceptions

Exception Type	Condition
NotSupportedException	This operation is not supported.

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.11. [MySQLCommand.CreateParameter](#) Method

Creates a new instance of a [MySQLParameter](#) object.

Syntax: Visual Basic

```
Public Function CreateParameter() As MySQLParameter
```

Syntax: C#

```
public MySQLParameter CreateParameter();
```

Return Value

A [MySQLParameter](#) object.

Remarks

This method is a strongly-typed version of CreateParameter.

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.12. [MySQLCommand.ExecuteNonQuery](#) Method**Syntax: Visual Basic**

```
NotOverridable Public Function ExecuteNonQuery() As Integer _
    Implements IDbCommand.ExecuteNonQuery
```

Syntax: C#

```
public int ExecuteNonQuery();
```

Implements

IDbCommand.ExecuteNonQuery

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13. ExecuteReader Method

Overload List

- [public MySQLDataReader ExecuteReader\(\);](#)
- [public MySQLDataReader ExecuteReader\(CommandBehavior\);](#)

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1. [MySQLCommand.ExecuteReader](#) Method**Syntax: Visual Basic**

```
Overloads Public Function ExecuteReader() As MySQLDataReader
```

Syntax: C#

```
public MySQLDataReader ExecuteReader();
```

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLCommand.ExecuteReader Overload List](#)

24.2.4.1.2.1.13.1.1. [MySQLDataReader](#) Class

Provides a means of reading a forward-only stream of rows from a MySQL database. This class cannot be inherited.

For a list of all members of this type, see [MySQLDataReader Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySQLDataReader_
    Inherits MarshalByRefObject_
    Implements IEnumerable, IDataReader, IDisposable, IDataRecord
```

Syntax: C#

```
public sealed class MySQLDataReader : MarshalByRefObject, IEnumerable, IDataReader, IDisposable, IDataRecord
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

See Also

[MySQLDataReader Members](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1. [MySQLDataReader](#) Members

[MySQLDataReader overview](#)

Public Instance Properties

Depth	Gets a value indicating the depth of nesting for the current row. This method is not supported currently and always returns 0.
FieldCount	Gets the number of columns in the current row.
HasRows	Gets a value indicating whether the MySQLDataReader contains one or more rows.
IsClosed	Gets a value indicating whether the data reader is closed.
Item	Overloaded. Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the

	MySqlDataReader class.
RecordsAffected	Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.

Public Instance Methods

Close	Closes the MySqlDataReader object.
CreateObjRef (inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Equals (inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetBoolean	Gets the value of the specified column as a Boolean.
GetByte	Gets the value of the specified column as a byte.
GetBytes	Reads a stream of bytes from the specified column offset into the buffer an array starting at the given buffer offset.
GetChar	Gets the value of the specified column as a single character.
GetChars	Reads a stream of characters from the specified column offset into the buffer as an array starting at the given buffer offset.
GetDataTypeName	Gets the name of the source data type.
GetDateTime	
GetDecimal	
GetDouble	
GetFieldType	Gets the Type that is the data type of the object.
GetFloat	
GetGuid	
GetHashCode (inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetInt16	
GetInt32	
GetInt64	
GetLifetimeService (inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetMySqlDateTime	
GetName	Gets the name of the specified column.
GetOrdinal	Gets the column ordinal, given the name of the column.
GetSchemaTable	Returns a DataTable that describes the column metadata of the MySqlDataReader.
GetString	
GetTimeSpan	
GetType (inherited from Object)	Gets the Type of the current instance.
GetUInt16	
GetUInt32	
GetUInt64	
GetValue	Gets the value of the specified column in its native format.
GetValues	Gets all attribute columns in the collection for the current row.
InitializeLifetimeService (inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
IsDBNull	Gets a value indicating whether the column contains non-existent or missing values.
NextResult	Advances the data reader to the next result, when reading the results of batch SQL statements.

Read	Advances the MySQLDataReader to the next record.
ToString(inherited from Object)	Returns a String that represents the current Object.

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.1. Depth Property

Gets a value indicating the depth of nesting for the current row. This method is not supported currently and always returns 0.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property Depth As Integer _
    Implements IDataReader.Depth
```

Syntax: C#

```
public int Depth {get;}
```

Implements

IDataReader.Depth

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.2. FieldCount Property

Gets the number of columns in the current row.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property FieldCount As Integer _
    Implements IDataRecord.FieldCount
```

Syntax: C#

```
public int FieldCount {get;}
```

Implements

IDataRecord.FieldCount

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.3. HasRows Property

Gets a value indicating whether the MySQLDataReader contains one or more rows.

Syntax: Visual Basic

```
Public ReadOnly Property HasRows As Boolean
```

Syntax: C#

```
public bool HasRows {get;}
```

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.4. IsClosed Property

Gets a value indicating whether the data reader is closed.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property IsClosed As Boolean _
    Implements IDataReader.IsClosed
```

Syntax: C#

```
public bool IsClosed {get;}
```

Implements

IDataReader.IsClosed

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.5. Item Property

Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the MySQLDataReader class.

Overload List

Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the MySQLDataReader class.

- [public object this\[int\] {get;}](#)

Gets the value of a column in its native format. In C#, this property is the indexer for the MySQLDataReader class.

- [public object this\[string\] {get;}](#)

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.5.1. Item Property (Int32)

Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the MySQLDataReader class.

Syntax: Visual Basic

```
NotOverridable Overloads Public Default ReadOnly Property Item( _
    ByVal i As Integer _
) _
    Implements IDataRecord.Item As Object _
    Implements IDataRecord.Item
```

Syntax: C#

```
public object this[
    inti
] {get;}
```

Implements

IDataRecord.Item

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLDataReader.Item Overload List](#)

24.2.4.1.2.1.13.1.1.1.5.2. Item Property (String)

Gets the value of a column in its native format. In C#, this property is the indexer for the MySQLDataReader class.

Syntax: Visual Basic

```
NotOverridable Overloads Public Default ReadOnly Property Item( _  
    ByVal name As String _  
) _  
- Implements IDataRecord.Item As Object _  
- Implements IDataRecord.Item
```

Syntax: C#

```
public object this[  
    string name  
] {get;}
```

Implements

IDataRecord.Item

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLDataReader.Item Overload List](#)

24.2.4.1.2.1.13.1.1.1.6. RecordsAffected Property

Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property RecordsAffected As Integer _  
- Implements IDataReader.RecordsAffected
```

Syntax: C#

```
public int RecordsAffected {get;}
```

Implements

IDataReader.RecordsAffected

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.7. MySQLDataReader.Close Method

Closes the MySQLDataReader object.

Syntax: Visual Basic

```
NotOverridable Public Sub Close() _  
- Implements IDataReader.Close
```

Syntax: C#

```
public void Close();
```

Implements

IDataReader.Close

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.8. MySQLDataReader.GetBoolean Method

Gets the value of the specified column as a Boolean.

Syntax: Visual Basic

```
NotOverridable Public Function GetBoolean( _
    ByVal i As Integer _
) As Boolean _
    Implements IDataRecord.GetBoolean
```

Syntax: C#

```
public bool GetBoolean(
    inti
);
```

Parameters

- `i`:

Return Value**Implements**

IDataRecord.GetBoolean

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.9. [MySqlDataReader.GetByte](#) Method

Gets the value of the specified column as a byte.

Syntax: Visual Basic

```
NotOverridable Public Function GetByte( _
    ByVal i As Integer _
) As Byte _
    Implements IDataRecord.GetByte
```

Syntax: C#

```
public byte GetByte(
    inti
);
```

Parameters

- `i`:

Return Value**Implements**

IDataRecord.GetByte

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.10. [MySqlDataReader.GetBytes](#) Method

Reads a stream of bytes from the specified column offset into the buffer an array starting at the given buffer offset.

Syntax: Visual Basic

```
NotOverridable Public Function GetBytes( _
    ByVal i As Integer, _
    ByVal dataIndex As Long, _
    ByVal buffer As Byte(), _
    ByVal bufferIndex As Integer, _
```

```

    ByVal length As Integer _
) As Long _
- Implements IDataRecord.GetBytes

```

Syntax: C#

```

public long GetBytes(
    inti,
    long dataIndex,
    byte[] buffer,
    int bufferIndex,
    int length
);

```

Parameters

- **i**: The zero-based column ordinal.
- **dataIndex**: The index within the field from which to begin the read operation.
- **buffer**: The buffer into which to read the stream of bytes.
- **bufferIndex**: The index for buffer to begin the read operation.
- **length**: The maximum length to copy into the buffer.

Return Value

The actual number of bytes read.

Implements

IDataRecord.GetBytes

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.11. [MySQLDataReader.GetChar](#) Method

Gets the value of the specified column as a single character.

Syntax: Visual Basic

```

NotOverridable Public Function GetChar( _
    ByVal i As Integer _
) As Char _
- Implements IDataRecord.GetChar

```

Syntax: C#

```

public char GetChar(
    inti
);

```

Parameters

- **i**:

Return Value**Implements**

IDataRecord.GetChar

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.12. [MySQLDataReader.GetChars](#) Method

Reads a stream of characters from the specified column offset into the buffer as an array starting at the given buffer offset.

Syntax: Visual Basic

```
NotOverridable Public Function GetChars( _
    ByVal i As Integer, _
    ByVal fieldOffset As Long, _
    ByVal buffer As Char(), _
    ByVal bufferoffset As Integer, _
    ByVal length As Integer _
) As Long _
- Implements IDataRecord.GetChars
```

Syntax: C#

```
public long GetChars(
    inti,
    longfieldOffset,
    char[]buffer,
    intbufferoffset,
    intlength
);
```

Parameters

- `i`:
- `fieldOffset`:
- `buffer`:
- `bufferoffset`:
- `length`:

Return Value

Implements

IDataRecord.GetChars

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.13. [MySQLDataReader.GetDataTypeName](#) Method

Gets the name of the source data type.

Syntax: Visual Basic

```
NotOverridable Public Function GetDataTypeName( _
    ByVal i As Integer _
) As String _
- Implements IDataRecord.GetDataTypeName
```

Syntax: C#

```
public string GetDataTypeName(
    inti
);
```

Parameters

- `i`:

Return Value

Implements

IDataRecord.GetDataTypeName

See Also[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)24.2.4.1.2.1.13.1.1.14. [MySqlDataReader.GetDateTime](#) Method**Syntax: Visual Basic**

```
NotOverridable Public Function GetDateTime( _  
    ByVal index As Integer _  
) As Date _  
- Implements IDataRecord.GetDateTime
```

Syntax: C#

```
public DateTime GetDateTime(  
    int index  
);
```

Implements

IDataRecord.GetDateTime

See Also[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)24.2.4.1.2.1.13.1.1.15. [MySqlDataReader.GetDecimal](#) Method**Syntax: Visual Basic**

```
NotOverridable Public Function GetDecimal( _  
    ByVal index As Integer _  
) As Decimal _  
- Implements IDataRecord.GetDecimal
```

Syntax: C#

```
public decimal GetDecimal(  
    int index  
);
```

Implements

IDataRecord.GetDecimal

See Also[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)24.2.4.1.2.1.13.1.1.16. [MySqlDataReader.GetDouble](#) Method**Syntax: Visual Basic**

```
NotOverridable Public Function GetDouble( _  
    ByVal index As Integer _  
) As Double _  
- Implements IDataRecord.GetDouble
```

Syntax: C#

```
public double GetDouble(  
    int index  
);
```

Implements

IDataRecord.GetDouble

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.17. [MySqlDataReader.GetFieldType](#) Method

Gets the Type that is the data type of the object.

Syntax: Visual Basic

```
NotOverridable Public Function GetFieldType( _  
    ByVal i As Integer _  
) As Type _  
- Implements IDataRecord.GetFieldType
```

Syntax: C#

```
public Type GetFieldType(  
    int i  
);
```

Parameters

- `i`:

Return Value

Implements

IDataRecord.GetFieldType

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.18. [MySqlDataReader.GetFloat](#) Method

Syntax: Visual Basic

```
NotOverridable Public Function GetFloat( _  
    ByVal index As Integer _  
) As Single _  
- Implements IDataRecord.GetFloat
```

Syntax: C#

```
public float GetFloat(  
    int index  
);
```

Implements

IDataRecord.GetFloat

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.19. [MySqlDataReader.GetGuid](#) Method

Syntax: Visual Basic

```
NotOverridable Public Function GetGuid( _  
    ByVal index As Integer _  
) As Guid _  
- Implements IDataRecord.GetGuid
```

Syntax: C#

```
public Guid GetGuid(  
    int index  
);
```

Implements

IDataRecord.GetGuid

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.20. MySQLDataReader.GetInt16 Method**Syntax: Visual Basic**

```
NotOverridable Public Function GetInt16( _  
    ByVal index As Integer _  
    ) As Short _  
    Implements IDataRecord.GetInt16
```

Syntax: C#

```
public short GetInt16(  
    int index  
);
```

Implements

IDataRecord.GetInt16

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.21. MySQLDataReader.GetInt32 Method**Syntax: Visual Basic**

```
NotOverridable Public Function GetInt32( _  
    ByVal index As Integer _  
    ) As Integer _  
    Implements IDataRecord.GetInt32
```

Syntax: C#

```
public int GetInt32(  
    int index  
);
```

Implements

IDataRecord.GetInt32

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.22. MySQLDataReader.GetInt64 Method**Syntax: Visual Basic**

```
NotOverridable Public Function GetInt64( _  
    ByVal index As Integer _  
    ) As Long _  
    Implements IDataRecord.GetInt64
```

Syntax: C#

```
public long GetInt64(
    int index
);
```

Implements

IDataRecord.GetInt64

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.23. [MySqlDataReader.GetMySqlDateTime](#) Method**Syntax: Visual Basic**

```
Public Function GetMySqlDateTime( _
    ByVal index As Integer _
) As MySqlDateTime
```

Syntax: C#

```
public MySqlDateTime GetMySqlDateTime(
    int index
);
```

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.24. [MySqlDataReader.GetName](#) Method

Gets the name of the specified column.

Syntax: Visual Basic

```
NotOverridable Public Function GetName( _
    ByVal i As Integer _
) As String _
    Implements IDataRecord.GetName
```

Syntax: C#

```
public string GetName(
    int i
);
```

Parameters

- **i**:

Return Value**Implements**

IDataRecord.GetName

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.25. [MySqlDataReader.GetOrdinal](#) Method

Gets the column ordinal, given the name of the column.

Syntax: Visual Basic

```
NotOverridable Public Function GetOrdinal( _
    ByVal name As String _
) As Integer _
    -
```

```
Implements IDataRecord.GetOrdinal
```

Syntax: C#

```
public int GetOrdinal(  
    string name  
);
```

Parameters

- `name`:

Return Value**Implements**

IDataRecord.GetOrdinal

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.26. [MySQLDataReader.GetOrdinal](#) Method

Returns a DataTable that describes the column metadata of the MySQLDataReader.

Syntax: Visual Basic

```
NotOverridable Public Function GetSchemaTable() As DataTable _  
    Implements IDataReader.GetSchemaTable
```

Syntax: C#

```
public DataTable GetSchemaTable();
```

Return Value**Implements**

IDataReader.GetSchemaTable

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.27. [MySQLDataReader.GetString](#) Method

Syntax: Visual Basic

```
NotOverridable Public Function GetString( _  
    ByVal index As Integer _  
) As String _  
    Implements IDataRecord.GetString
```

Syntax: C#

```
public string GetString(  
    int index  
);
```

Implements

IDataRecord.GetString

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.28. [MySqlDataReader.GetTimeSpan](#) Method

Syntax: Visual Basic

```
Public Function GetTimeSpan( _  
    ByVal index As Integer _  
) As TimeSpan
```

Syntax: C#

```
public TimeSpan GetTimeSpan(  
    int index  
);
```

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.29. [MySqlDataReader.GetUInt16](#) Method

Syntax: Visual Basic

```
Public Function GetUInt16( _  
    ByVal index As Integer _  
) As UInt16
```

Syntax: C#

```
public ushort GetUInt16(  
    int index  
);
```

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.30. [MySqlDataReader.GetUInt32](#) Method

Syntax: Visual Basic

```
Public Function GetUInt32( _  
    ByVal index As Integer _  
) As UInt32
```

Syntax: C#

```
public uint GetUInt32(  
    int index  
);
```

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.31. [MySqlDataReader.GetUInt64](#) Method

Syntax: Visual Basic

```
Public Function GetUInt64( _  
    ByVal index As Integer _  
) As UInt64
```

Syntax: C#

```
public ulong GetUInt64(  
    int index  
);
```

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.32. [MySqlDataReader.GetValue](#) Method

Gets the value of the specified column in its native format.

Syntax: Visual Basic

```
NotOverridable Public Function GetValue( _  
    ByVal i As Integer _  
    ) As Object _  
    Implements IDataRecord.GetValue
```

Syntax: C#

```
public object GetValue(  
    inti  
);
```

Parameters

- `i`:

Return Value

Implements

`IDataRecord.GetValue`

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.33. [MySqlDataReader.GetValues](#) Method

Gets all attribute columns in the collection for the current row.

Syntax: Visual Basic

```
NotOverridable Public Function GetValues( _  
    ByVal values As Object() _  
    ) As Integer _  
    Implements IDataRecord.GetValues
```

Syntax: C#

```
public int GetValues(  
    object[] values  
);
```

Parameters

- `values`:

Return Value

Implements

`IDataRecord.GetValues`

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.34. [MySqlDataReader.IsDBNull](#) Method

Gets a value indicating whether the column contains non-existent or missing values.

Syntax: Visual Basic

```
NotOverridable Public Function IsDBNull( _  
    ByVal i As Integer _  
) As Boolean _  
    Implements IDataRecord.IsDBNull
```

Syntax: C#

```
public bool IsDBNull(  
    inti  
);
```

Parameters

- `i`:

Return Value**Implements**

IDataRecord.IsDBNull

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.35. [MySQLDataReader.NextResult](#) Method

Advances the data reader to the next result, when reading the results of batch SQL statements.

Syntax: Visual Basic

```
NotOverridable Public Function NextResult() As Boolean _  
    Implements IDataReader.NextResult
```

Syntax: C#

```
public bool NextResult();
```

Return Value**Implements**

IDataReader.NextResult

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.36. [MySQLDataReader.Read](#) Method

Advances the MySQLDataReader to the next record.

Syntax: Visual Basic

```
NotOverridable Public Function Read() As Boolean _  
    Implements IDataReader.Read
```

Syntax: C#

```
public bool Read();
```

Return Value**Implements**

IDataReader.Read

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.2. [MySQLCommand.ExecuteReader](#) Method**Syntax: Visual Basic**

```
Overloads Public Function ExecuteReader( _  
    ByVal behavior As CommandBehavior _  
) As MySQLDataReader
```

Syntax: C#

```
public MySQLDataReader ExecuteReader(  
    CommandBehaviorbehavior  
);
```

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLCommand.ExecuteReader Overload List](#)

24.2.4.1.2.1.14. [MySQLCommand.ExecuteScalar](#) Method**Syntax: Visual Basic**

```
NotOverridable Public Function ExecuteScalar() As Object _  
    Implements IDbCommand.ExecuteScalar
```

Syntax: C#

```
public object ExecuteScalar();
```

Implements

IDbCommand.ExecuteScalar

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.15. [MySQLCommand.Prepare](#) Method**Syntax: Visual Basic**

```
NotOverridable Public Sub Prepare() _  
    Implements IDbCommand.Prepare
```

Syntax: C#

```
public void Prepare();
```

Implements

IDbCommand.Prepare

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.3. [MySQLCommandBuilder](#) Class

For a list of all members of this type, see [MySQLCommandBuilder Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySQLCommandBuilder_  
    Inherits Component
```

Syntax: C#

```
public sealed class MySqlCommandBuilder : Component
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

See Also

[MySqlCommandBuilder Members](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.3.1. MySqlCommandBuilder Members

[MySqlCommandBuilder overview](#)

Public Static (Shared) Methods

DeriveParameters	Overloaded. Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySQL.
----------------------------------	--

Public Instance Constructors

MySqlCommandBuilder	Overloaded. Initializes a new instance of the MySqlCommandBuilder class.
-------------------------------------	--

Public Instance Properties

Container(inherited from Component)	Gets the IContainer that contains the Component.
DataAdapter	
QuotePrefix	
QuoteSuffix	
Site(inherited from Component)	Gets or sets the ISite of the Component.

Public Instance Methods

CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Dispose(inherited from Component)	Releases all resources used by the Component.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetDeleteCommand	
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetInsertCommand	
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Type of the current instance.
GetUpdateCommand	

InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
RefreshSchema	
ToString(inherited from Component)	Returns a String containing the name of the Component, if any. This method should not be overridden.

Public Instance Events

Disposed(inherited from Component)	Adds an event handler to listen to the Disposed event on the component.
------------------------------------	---

See Also

[MySQLCommandBuilder Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.3.1.1. DeriveParameters Method

Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySQL.

Overload List

Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySQL.

- `public static void DeriveParameters(MySqlCommand);`
- `public static void DeriveParameters(MySqlCommand,bool);`

See Also

[MySQLCommandBuilder Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.3.1.1.1. MySqlCommandBuilder.DeriveParameters Method

Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySQL.

Syntax: Visual Basic

```
Overloads Public Shared Sub DeriveParameters( _
    ByVal command As MySqlCommand _
)
```

Syntax: C#

```
public static void DeriveParameters(
    MySqlCommand command
);
```

Parameters

- `command`: The MySqlCommand referencing the stored procedure from which the parameter information is to be derived. The derived parameters are added to the Parameters collection of the MySqlCommand.

Exceptions

Exception Type	Condition
InvalidOperationException	The command text is not a valid stored procedure name.

24.2.4.1.3.1.2. [MySQLCommandBuilder](#) Constructor

Initializes a new instance of the [MySQLCommandBuilder](#) class.

Overload List

Initializes a new instance of the [MySQLCommandBuilder](#) class.

- [public MySQLCommandBuilder\(\);](#)
- [public MySQLCommandBuilder\(MySqlDataAdapter\);](#)
- [public MySQLCommandBuilder\(MySqlDataAdapter,bool\);](#)
- [public MySQLCommandBuilder\(bool\);](#)

See Also

[MySQLCommandBuilder Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.3.1.2.1. [MySQLCommandBuilder](#) Constructor

Initializes a new instance of the [MySQLCommandBuilder](#) class.

Syntax: Visual Basic

```
Overloads Public Sub New()
```

Syntax: C#

```
public MySQLCommandBuilder();
```

See Also

[MySQLCommandBuilder Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLCommandBuilder Constructor Overload List](#)

24.2.4.1.3.1.2.2. [MySQLCommandBuilder](#) Constructor**Syntax: Visual Basic**

```
Overloads Public Sub New( _
    ByVal adapter As MySqlDataAdapter _
)
```

Syntax: C#

```
public MySqlCommandBuilder(
    MySqlDataAdapteradapter
);
```

See Also

[MySqlCommandBuilder Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlCommandBuilder Constructor Overload List](#)

24.2.4.1.3.1.2.2.1. [MySqlDataAdapter Class](#)

For a list of all members of this type, see [MySqlDataAdapter Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySqlDataAdapter_
    Inherits DbDataAdapter
```

Syntax: C#

```
public sealed class MySqlDataAdapter : DbDataAdapter
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

[MySqlDataAdapter Members](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.3.1.2.2.1.1. [MySqlDataAdapter Members](#)

[MySqlDataAdapter overview](#)

Public Instance Constructors

MySqlDataAdapter	Overloaded. Initializes a new instance of the MySqlDataAdapter class.
----------------------------------	---

Public Instance Properties

AcceptChangesDuringFill (inherited from DataAdapter)	Gets or sets a value indicating whether AcceptChanges is called on a DataRow after it is added to the DataTable during any of the Fill operations.
AcceptChangesDuringUpdate (inherited from DataAdapter)	Gets or sets whether AcceptChanges is called during a Update .
Container (inherited from Component)	Gets the IContainer that contains the Component .
ContinueUpdateOnError (inherited from DataAdapter)	Gets or sets a value that specifies whether to generate an exception when an error is encountered during a row update.
DeleteCommand	Overloaded.
FillLoadOption (inherited from DataAdapter)	Gets or sets the LoadOption that determines how the adapter fills the DataTable from the DbDataReader .
InsertCommand	Overloaded.
MissingMappingAction (inherited from DataAdapter)	Determines the action to take when incoming data does not have a matching table or column.
MissingSchemaAction (inherited from DataAdapter)	Determines the action to take when existing DataSet schema does not match incoming data.
ReturnProviderSpecificTypes (inherited from DataAdapter)	Gets or sets whether the Fill method should return provider-specific values or common CLS-compliant values.

SelectCommand	Overloaded.
Site(inherited from Component)	Gets or sets the ISite of the Component.
TableMappings(inherited from DataAdapter)	Gets a collection that provides the master mapping between a source table and a DataTable.
UpdateBatchSize(inherited from DbDataAdapter)	Gets or sets a value that enables or disables batch processing support, and specifies the number of commands that can be executed in a batch.
UpdateCommand	Overloaded.

Public Instance Methods

CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Dispose(inherited from Component)	Releases all resources used by the Component.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
Fill(inherited from DbDataAdapter)	Overloaded. Adds or refreshes rows in the DataSet to match those in the data source using the DataSetname, and creates a DataTable named "Table."
FillSchema(inherited from DbDataAdapter)	Overloaded. Configures the schema of the specified DataTable based on the specified SchemaType.
GetFillParameters(inherited from DbDataAdapter)	Gets the parameters set by the user when executing an SQL SELECT statement.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Type of the current instance.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
ResetFillLoadOption(inherited from DataAdapter)	Resets FillLoadOption to its default state and causes Fill to honor AcceptChangesDuringFill.
ShouldSerializeAcceptChangesDuringFill(inherited from DataAdapter)	Determines whether the AcceptChangesDuringFill property should be persisted.
ShouldSerializeFillLoadOption(inherited from DataAdapter)	Determines whether the FillLoadOption property should be persisted.
ToString(inherited from Component)	Returns a String containing the name of the Component, if any. This method should not be overridden.
Update(inherited from DbDataAdapter)	Overloaded. Calls the respective INSERT, UPDATE, or DELETE statements for each inserted, updated, or deleted row in the specified DataSet.

Public Instance Events

Disposed(inherited from Component)	Adds an event handler to listen to the Disposed event on the component.
FillError(inherited from DataAdapter)	Returned when an error occurs during a fill operation.
RowUpdated	Occurs during Update after a command is executed against the data source. The attempt to update is made, so the event fires.
RowUpdating	Occurs during Update before a command is executed against the data source. The attempt to update is made, so the event fires.

Protected Internal Instance Properties

FillCommandBehavior(inherited from DbDataAdapter)	Gets or sets the behavior of the command used to fill the data adapter.

24.2.4.1.3.1.2.2.1.1.6. MySqlCommandAdapter.RowUpdated Event

Occurs during Update after a command is executed against the data source. The attempt to update is made, so the event fires.

Syntax: Visual Basic

```
Public Event RowUpdated As MySqlRowUpdatedEventHandler
```

Syntax: C#

```
public event MySqlRowUpdatedEventHandler RowUpdated;
```

Event Data

The event handler receives an argument of type [MySqlRowUpdatedEventArgs](#) containing data related to this event. The following [MySqlRowUpdatedEventArgs](#) properties provide information specific to this event.

Property	Description
Command	Gets or sets the MySqlCommand executed when Update is called.
Errors	Gets any errors generated by the .NET Framework data provider when the Command was executed.
RecordsAffected	Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.
Row	Gets the DataRow sent through an Update.
RowCount	Gets the number of rows processed in a batch of updated records.
StatementType	Gets the type of SQL statement executed.
Status	Gets the UpdateStatus of the Command property.
TableMapping	Gets the DataTableMapping sent through an Update.

Public Instance Constructors

MySqlRowUpdatedEventArgs Constructor	Initializes a new instance of the MySqlRowUpdatedEventArgs class.
--	---

Public Instance Properties

Command	Overloaded. Gets or sets the MySqlCommand executed when Update is called.
Errors(inherited from RowUpdatedEventArgs)	Gets any errors generated by the .NET Framework data provider when the Command was executed.
RecordsAffected(inherited from RowUpdatedEventArgs)	Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.
Row(inherited from RowUpdatedEventArgs)	Gets the DataRow sent through an Update.
RowCount(inherited from RowUpdatedEventArgs)	Gets the number of rows processed in a batch of updated records.

StatementType(inherited from RowUpdatedEventArgs)	Gets the type of SQL statement executed.
Status(inherited from RowUpdatedEventArgs)	Gets the UpdateStatusof the Commandproperty.
TableMapping(inherited from RowUpdatedEventArgs)	Gets the DataTableMappingsent through an Update.

Public Instance Methods

CopyToRows(inherited from RowUpdatedEventArgs)	Overloaded. Copies references to the modified rows into the provided array.
Equals(inherited from Object)	Determines whether the specified Objectis equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCodeis suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Typeof the current instance.
ToString(inherited from Object)	Returns a Stringthat represents the current Object.

24.2.4.1.3.1.2.2.1.1.6.1.1.1.1. MySQLRowUpdatedEventArgs Constructor

Initializes a new instance of the MySQLRowUpdatedEventArgs class.

Syntax: Visual Basic

```
Public Sub New( _
    ByVal row As DataRow, _
    ByVal command As IDbCommand, _
    ByVal statementType As StatementType, _
    ByVal tableMapping As DataTableMapping _
)
```

Syntax: C#

```
public MySQLRowUpdatedEventArgs(
    DataRowrow,
    IDbCommandcommand,
    StatementTypestatementType,
    DataTableMappingtableMapping
);
```

Parameters

- **row**: The DataRow sent through an Update.
- **command**: The IDbCommand executed when Update is called.
- **statementType**: One of the StatementType values that specifies the type of query executed.
- **tableMapping**: The DataTableMapping sent through an Update.

24.2.4.1.3.1.2.2.1.1.6.1.1.1.2. Command Property

Gets or sets the MySqlCommand executed when Update is called.

Syntax: Visual Basic

```
Overloads Public ReadOnly Property Command As MySqlCommand
```

Syntax: C#

```
new public MySqlCommand Command {get;}
```

See Also

[MySqlRowUpdatedEventArgs Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.3.1.2.2.1.1.7. [MySqlDataAdapter.RowUpdating](#) Event

Occurs during Update before a command is executed against the data source. The attempt to update is made, so the event fires.

Syntax: Visual Basic

```
Public Event RowUpdating As MySqlRowUpdatingEventHandler
```

Syntax: C#

```
public event MySqlRowUpdatingEventHandler RowUpdating;
```

Event Data

The event handler receives an argument of type [MySqlRowUpdatingEventArgs](#) containing data related to this event. The following [MySqlRowUpdatingEventArgs](#) properties provide information specific to this event.

Property	Description
Command	Gets or sets the MySqlCommand to execute when performing the Update.
Errors	Gets any errors generated by the .NET Framework data provider when the Command executes.
Row	Gets the DataRow that will be sent to the server as part of an insert, update, or delete operation.
StatementType	Gets the type of SQL statement to execute.
Status	Gets or sets the UpdateStatus of the Command property.
TableMapping	Gets the DataTableMapping to send through the Update.

Public Instance Constructors

MySQLRowUpdatingEventArgs Constructor	Initializes a new instance of the MySQLRowUpdatingEventArgs class.
---	--

Public Instance Properties

Command	Overloaded. Gets or sets the MySqlCommand to execute when performing the Update.
Errors(inherited from RowUpdatingEventArgs)	Gets any errors generated by the .NET Framework data provider when the Command executes.
Row(inherited from RowUpdatingEventArgs)	Gets the DataRow that will be sent to the server as part of an insert, update, or delete operation.
StatementType(inherited from RowUpdatingEventArgs)	Gets the type of SQL statement to execute.
Status(inherited from RowUpdatingEventArgs)	Gets or sets the UpdateStatus of the Command property.
TableMapping(inherited from RowUpdatingEventArgs)	Gets the DataTableMapping to send through the Update.

Public Instance Methods

Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
ToString(inherited from Object)	Returns a String that represents the current Object.

24.2.4.1.3.1.2.2.1.1.7.1.1.1.1. MySQLRowUpdatingEventArgs Constructor

Initializes a new instance of the MySQLRowUpdatingEventArgs class.

Syntax: Visual Basic

```
Public Sub New( _
    ByVal row As DataRow, _
    ByVal command As IDbCommand, _
    ByVal statementType As StatementType, _
    ByVal tableMapping As DataTableMapping _
)
```

Syntax: C#

```
public MySQLRowUpdatingEventArgs(
    DataRow row,
    IDbCommand command,
    StatementType statementType,
    DataTableMapping tableMapping
);
```

Parameters

- **row**: The DataRow to update.
- **command**: The IDbCommand to execute during update.
- **statementType**: One of the StatementType values that specifies the type of query executed.
- **tableMapping**: The DataTableMapping sent through an update.

24.2.4.1.4. MySqlConnectionException Class

The exception that is thrown when MySQL returns an error. This class cannot be inherited.

For a list of all members of this type, see [MySqlConnectionException Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySqlConnectionException  
    Inherits SystemException
```

Syntax: C#

```
public sealed class MySqlConnectionException : SystemException
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

See Also

[MySqlException Members](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.4.1. [MySqlException](#) Members

[MySqlException overview](#)

Public Instance Properties

Data(inherited from Exception)	Gets a collection of key/value pairs that provide additional, user-defined information about the exception.
HelpLink(inherited from Exception)	Gets or sets a link to the help file associated with this exception.
InnerException(inherited from Exception)	Gets the Exception instance that caused the current exception.
Message(inherited from Exception)	Gets a message that describes the current exception.
Number	Gets a number that identifies the type of error.
Source(inherited from Exception)	Gets or sets the name of the application or the object that causes the error.
StackTrace(inherited from Exception)	Gets a string representation of the frames on the call stack at the time the current exception was thrown.
TargetSite(inherited from Exception)	Gets the method that throws the current exception.

Public Instance Methods

Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetBaseException(inherited from Exception)	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetObjectData(inherited from Exception)	When overridden in a derived class, sets the SerializationInfo with information about the exception.
GetType(inherited from Exception)	Gets the runtime type of the current instance.
ToString(inherited from Exception)	Creates and returns a string representation of the current exception.

24.2.4.1.4.1.1. Number Property

Gets a number that identifies the type of error.

Syntax: Visual Basic

```
Public ReadOnly Property Number As Integer
```

Syntax: C#

```
public int Number {get;}
```

See Also

[MySQLException Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.5. MySQLHelper Class

Helper class that makes it easier to work with the provider.

For a list of all members of this type, see [MySQLHelper Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySQLHelper
```

Syntax: C#

```
public sealed class MySQLHelper
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

See Also

[MySQLHelper Members](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.5.1. MySQLHelper Members

[MySQLHelper overview](#)

Public Static (Shared) Methods

ExecuteDataRow	Executes a single SQL command and returns the first row of the resultset. A new MySqlConnection object is created, opened, and closed during this method.
ExecuteDataset	Overloaded. Executes a single SQL command and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.
ExecuteNonQuery	Overloaded. Executes a single command against a MySQL database. The MySQLConnection is assumed to be open when the method is called and remains open after the method completes.
ExecuteReader	Overloaded. Executes a single command against a MySQL database.
ExecuteScalar	Overloaded. Execute a single command against a MySQL database.
UpdateDataSet	Updates the given table with data from the given DataSet

Public Instance Methods

Equals (inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode (inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType (inherited from Object)	Gets the Type of the current instance.
ToString (inherited from Object)	Returns a String that represents the current Object.

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.5.1.1. [MySQLHelper.ExecuteDataRow](#) Method

Executes a single SQL command and returns the first row of the resultset. A new [MySQLConnection](#) object is created, opened, and closed during this method.

Syntax: Visual Basic

```
Public Shared Function ExecuteDataRow( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ParamArray parms As MySqlParameter() _
) As DataRow
```

Syntax: C#

```
public static DataRow ExecuteDataRow(
    string connectionString,
    string commandText,
    params MySqlParameter[] parms
);
```

Parameters

- [connectionString](#): Settings to be used for the connection
- [commandText](#): Command to execute
- [parms](#): Parameters to use for the command

Return Value

[DataRow](#) containing the first row of the resultset

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.5.1.2. [ExecuteDataset](#) Method

Executes a single SQL command and returns the resultset in a [DataSet](#). The state of the [MySQLConnection](#) object remains unchanged after execution of this method.

Overload List

Executes a single SQL command and returns the resultset in a [DataSet](#). The state of the [MySQLConnection](#) object remains unchanged after execution of this method.

- [public static DataSet ExecuteDataset\(MySqlConnection,string\);](#)

Executes a single SQL command and returns the resultset in a [DataSet](#). The state of the [MySQLConnection](#) object remains unchanged after execution of this method.

- [public static DataSet ExecuteDataset\(MySqlConnection,string,params MySqlParameter\[\]\);](#)

Executes a single SQL command and returns the resultset in a [DataSet](#). A new [MySQLConnection](#) object is created, opened, and closed during this method.

- [public static DataSet ExecuteDataset\(string,string\);](#)

Executes a single SQL command and returns the resultset in a [DataSet](#). A new [MySQLConnection](#) object is created, opened, and closed during this method.

- `public static DataSet ExecuteDataset(string,string,params MySqlParameter[]);`

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.5.1.2.1. [MySqlHelper.ExecuteDataset](#) Method

Executes a single SQL command and returns the resultset in a DataSet. The state of the [MySqlConnection](#) object remains unchanged after execution of this method.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _
    ByVal connection As MySqlConnection, _
    ByVal commandText As String _
) As DataSet
```

Syntax: C#

```
public static DataSet ExecuteDataset(
    MySqlConnectionconnection,
    stringcommandText
);
```

Parameters

- `connection`: [MySqlConnection](#) object to use
- `commandText`: Command to execute

Return Value

DataSetcontaining the resultset

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteDataset Overload List](#)

24.2.4.1.5.1.2.2. [MySqlHelper.ExecuteDataset](#) Method

Executes a single SQL command and returns the resultset in a DataSet. The state of the [MySqlConnection](#) object remains unchanged after execution of this method.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _
    ByVal connection As MySqlConnection, _
    ByVal commandText As String, _
    ParamArray commandParameters As MySqlParameter() _
) As DataSet
```

Syntax: C#

```
public static DataSet ExecuteDataset(
    MySqlConnectionconnection,
    stringcommandText,
    params MySqlParameter[]commandParameters
);
```

Parameters

- `connection`: [MySqlConnection](#) object to use
- `commandText`: Command to execute
- `commandParameters`: Parameters to use for the command

Return Value

DataSetcontaining the resultset

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteDataset Overload List](#)

24.2.4.1.5.1.2.3. [MySQLHelper.ExecuteDataset](#) Method

Executes a single SQL command and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _  
    ByVal connectionString As String, _  
    ByVal commandText As String _  
) As DataSet
```

Syntax: C#

```
public static DataSet ExecuteDataset(  
    stringconnectionString,  
    stringcommandText  
);
```

Parameters

- [connectionString](#): Settings to be used for the connection
- [commandText](#): Command to execute

Return Value

DataSetcontaining the resultset

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteDataset Overload List](#)

24.2.4.1.5.1.2.4. [MySQLHelper.ExecuteDataset](#) Method

Executes a single SQL command and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _  
    ByVal connectionString As String, _  
    ByVal commandText As String, _  
    ParamArray commandParameters As MySqlParameter() _  
) As DataSet
```

Syntax: C#

```
public static DataSet ExecuteDataset(  
    stringconnectionString,  
    stringcommandText,  
    params MySqlParameter[]commandParameters  
);
```

Parameters

- [connectionString](#): Settings to be used for the connection
- [commandText](#): Command to execute
- [commandParameters](#): Parameters to use for the command

Return Value

DataSet containing the resultset

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteDataset Overload List](#)

24.2.4.1.5.1.3. ExecuteNonQuery Method

Executes a single command against a MySQL database. The [MySqlConnection](#) is assumed to be open when the method is called and remains open after the method completes.

Overload List

Executes a single command against a MySQL database. The [MySqlConnection](#) is assumed to be open when the method is called and remains open after the method completes.

- `public static int ExecuteNonQuery(MySqlConnection, string, params MySqlParameter[]);`

Executes a single command against a MySQL database. A new [MySqlConnection](#) is created using the [ConnectionString](#) given.

- `public static int ExecuteNonQuery(string, string, params MySqlParameter[]);`

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.5.1.3.1. MySqlHelper.ExecuteNonQuery Method

Executes a single command against a MySQL database. The [MySqlConnection](#) is assumed to be open when the method is called and remains open after the method completes.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteNonQuery( _
    ByVal connection As MySqlConnection, _
    ByVal commandText As String, _
    ParamArray commandParameters As MySqlParameter() _
) As Integer
```

Syntax: C#

```
public static int ExecuteNonQuery(
    MySqlConnection connection,
    string commandText,
    params MySqlParameter[] commandParameters
);
```

Parameters

- `connection`: [MySqlConnection](#) object to use
- `commandText`: SQL command to be executed
- `commandParameters`: Array of [MySqlParameter](#) objects to use with the command.

Return Value

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteNonQuery Overload List](#)

24.2.4.1.5.1.3.2. MySqlHelper.ExecuteNonQuery Method

Executes a single command against a MySQL database. A new [MySqlConnection](#) is created using the [ConnectionString](#) given.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteNonQuery( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ParamArray parms As MySqlParameter() _
) As Integer
```

Syntax: C#

```
public static int ExecuteNonQuery(
    string connectionString,
    string commandText,
    params MySqlParameter[] parms
);
```

Parameters

- `connectionString`: [ConnectionString](#) to use
- `commandText`: SQL command to be executed
- `parms`: Array of [MySqlParameter](#) objects to use with the command.

Return Value**See Also**

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteNonQuery Overload List](#)

24.2.4.1.5.1.4. ExecuteReader Method

Executes a single command against a MySQL database.

Overload List

Executes a single command against a MySQL database.

- [public static MySqlDataReader ExecuteReader\(string,string\);](#)

Executes a single command against a MySQL database.

- [public static MySqlDataReader ExecuteReader\(string,string,params MySqlParameter\[\]\);](#)

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.5.1.4.1. MySqlHelper.ExecuteReader Method

Executes a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteReader( _
    ByVal connectionString As String, _
    ByVal commandText As String _
) As MySqlDataReader
```

Syntax: C#

```
public static MySqlDataReader ExecuteReader(
    string connectionString,
    string commandText
);
```

Parameters

- `connectionString`: Settings to use for this command

- `commandText`: Command text to use

Return Value

[MySqlDataReader](#) object ready to read the results of the command

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteReader Overload List](#)

24.2.4.1.5.1.4.2. [MySqlHelper.ExecuteReader](#) Method

Executes a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteReader( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ParamArray commandParameters As MySqlParameter() _
) As MySqlDataReader
```

Syntax: C#

```
public static MySqlDataReader ExecuteReader(
    string connectionString,
    string commandText,
    params MySqlParameter[] commandParameters
);
```

Parameters

- `connectionString`: Settings to use for this command
- `commandText`: Command text to use
- `commandParameters`: Array of [MySqlParameter](#) objects to use with the command

Return Value

[MySqlDataReader](#) object ready to read the results of the command

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteReader Overload List](#)

24.2.4.1.5.1.5. ExecuteScalar Method

Execute a single command against a MySQL database.

Overload List

Execute a single command against a MySQL database.

- `public static object ExecuteScalar(MySqlConnection,string);`

Execute a single command against a MySQL database.

- `public static object ExecuteScalar(MySqlConnection,string,params MySqlParameter[]);`

Execute a single command against a MySQL database.

- `public static object ExecuteScalar(string,string);`

Execute a single command against a MySQL database.

- [public static object ExecuteScalar\(string,string,params MySqlParameter\[\]\);](#)

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.5.1.5.1. [MySqlHelper.ExecuteScalar](#) Method

Execute a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _  
    ByVal connection As MySqlConnection, _  
    ByVal commandText As String _  
) As Object
```

Syntax: C#

```
public static object ExecuteScalar(  
    MySqlConnection connection,  
    string commandText  
);
```

Parameters

- [connection](#): [MySqlConnection](#) object to use
- [commandText](#): Command text to use for the command

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteScalar Overload List](#)

24.2.4.1.5.1.5.2. [MySqlHelper.ExecuteScalar](#) Method

Execute a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _  
    ByVal connection As MySqlConnection, _  
    ByVal commandText As String, _  
    ParamArray commandParameters As MySqlParameter() _  
) As Object
```

Syntax: C#

```
public static object ExecuteScalar(  
    MySqlConnection connection,  
    string commandText,  
    params MySqlParameter[] commandParameters  
);
```

Parameters

- [connection](#): [MySqlConnection](#) object to use
- [commandText](#): Command text to use for the command
- [commandParameters](#): Parameters to use for the command

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteScalar Overload List](#)

24.2.4.1.5.1.5.3. [MySqlHelper.ExecuteScalar](#) Method

Execute a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _  
    ByVal connectionString As String, _  
    ByVal commandText As String _  
) As Object
```

Syntax: C#

```
public static object ExecuteScalar(  
    string connectionString,  
    string commandText  
);
```

Parameters

- `connectionString`: Settings to use for the update
- `commandText`: Command text to use for the update

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

24.2.4.1.5.1.5.4. [MySqlHelper.ExecuteScalar](#) Method

Execute a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _  
    ByVal connectionString As String, _  
    ByVal commandText As String, _  
    ParamArray commandParameters As MySqlParameter() _  
) As Object
```

Syntax: C#

```
public static object ExecuteScalar(  
    string connectionString,  
    string commandText,  
    params MySqlParameter[] commandParameters  
);
```

Parameters

- `connectionString`: Settings to use for the command
- `commandText`: Command text to use for the command
- `commandParameters`: Parameters to use for the command

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

24.2.4.1.5.1.6. `MySqlHelper.UpdateDataSet` Method

Updates the given table with data from the given DataSet

Syntax: Visual Basic

```
Public Shared Sub UpdateDataSet( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ByVal ds As DataSet, _
    ByVal tablename As String _
)
```

Syntax: C#

```
public static void UpdateDataSet(
    string connectionString,
    string commandText,
    DataSet ds,
    string tablename
);
```

Parameters

- `connectionString`: Settings to use for the update
- `commandText`: Command text to use for the update
- `ds`: DataSet containing the new data to use in the update
- `tablename`: Tablename in the dataset to update

Public Instance Constructors

MySqlConnectionException Constructor	Ctor
--	------

Public Instance Properties

Data(inherited from Exception)	Gets a collection of key/value pairs that provide additional, user-defined information about the exception.
HelpLink(inherited from Exception)	Gets or sets a link to the help file associated with this exception.
InnerException(inherited from Exception)	Gets the Exceptioninstance that caused the current exception.
Message(inherited from Exception)	Gets a message that describes the current exception.
Source(inherited from Exception)	Gets or sets the name of the application or the object that causes the error.
StackTrace(inherited from Exception)	Gets a string representation of the frames on the call stack at the time the current exception was thrown.
TargetSite(inherited from Exception)	Gets the method that throws the current exception.

Public Instance Methods

Equals(inherited from Object)	Determines whether the specified Objectis equal to the current Object.
GetBaseException(inherited from Exception)	When overridden in a derived class, returns the Exceptionthat is the root cause of one or more subsequent exceptions.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCodeis suitable for use in hashing algorithms and data structures like a hash table.
GetObjectData(inherited from Exception)	When overridden in a derived class, sets the SerializationIn-formation about the exception.
GetType(inherited from Exception)	Gets the runtime type of the current instance.
ToString(inherited from Exception)	Creates and returns a string representation of the current excep-tion.

Protected Instance Properties

HResult(inherited from Exception)	Gets or sets HRESULT, a coded numerical value that is as-signed to a specific exception.
-----------------------------------	--

Protected Instance Methods

Finalize(inherited from Object)	Allows an Objectto attempt to free resources and perform other cleanup operations before the Objectis reclaimed by garbage collection.
MemberwiseClone(inherited from Object)	Creates a shallow copy of the current Object.

Public Static (Shared) Type Conversions

Explicit MySQLDateTime to DateTime Conversion	
---	--

Public Instance Properties

Day	Returns the day portion of this datetime
Hour	Returns the hour portion of this datetime
IsNull (inherited from MySQLValue)	
IsValidDateTime	Indicates if this object contains a value that can be represented as a DateTime
Minute	Returns the minute portion of this datetime
Month	Returns the month portion of this datetime
Second	Returns the second portion of this datetime
ValueAsObject (inherited from MySQLValue)	Returns the value of this field as an object
Year	Returns the year portion of this datetime

Public Instance Methods

Equals (inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetDateTime	Returns this value as a DateTime
GetHashCode (inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType (inherited from Object)	Gets the Type of the current instance.
ToString	Returns a MySQL specific string representation of this value

Protected Instance Fields

classType (inherited from MySQLValue)	The system type represented by this value
dbType (inherited from MySQLValue)	The generic dbtype of this value
isNull (inherited from MySQLValue)	Is this value null
mysqlDbType (inherited from MySQLValue)	The specific MySQL db type
mysqlTypeName (inherited from MySQLValue)	The MySQL specific typename of this value
objectValue (inherited from MySQLValue)	

Protected Instance Methods

Finalize (inherited from Object)	Allows an Object to attempt to free resources and perform other cleanup operations before the Object is reclaimed by garbage collection.
MemberwiseClone (inherited from Object)	Creates a shallow copy of the current Object .

24.2.5. Connector/NET Notes and Tips

In this section we will cover some of the more common use cases for Connector/NET, including BLOB handling, date handling, and using Connector/NET with common tools such as Crystal Reports.

24.2.5.1. Connecting to MySQL Using Connector/NET**24.2.5.1.1. Introduction**

All interaction between a .NET application and the MySQL server is routed through a [MySqlConnection](#) object. Before your application can interact with the server, a [MySqlConnection](#) object must be instantiated, configured, and opened.

Even when using the [MySqlHelper](#) class, a [MySqlConnection](#) object is created by the helper class.

In this section, we will describe how to connect to MySQL using the [MySqlConnection](#) object.

24.2.5.1.2. Creating a Connection String

The [MySqlConnection](#) object is configured using a connection string. A connection string contains sever key/value pairs, separated by semicolons. Each key/value pair is joined with an equals sign.

The following is a sample connection string:

```
Server=127.0.0.1;Uid=root;Pwd=12345;Database=test;
```

In this example, the [MySqlConnection](#) object is configured to connect to a MySQL server at `127.0.0.1`, with a username of `root` and a password of `12345`. The default database for all statements will be the `test` database.

The following options are typically used (a full list of options is available in the API documentation for [Section 24.2.3.3.15](#), “[ConnectionString](#)”):

- **Server**: The name or network address of the instance of MySQL to which to connect. The default is `localhost`. Aliases include `host`, `Data Source`, `DataSource`, `Address`, `Addr` and `Network Address`.
- **Uid**: The MySQL user account to use when connecting. Aliases include `User Id`, `Username` and `User name`.
- **Pwd**: The password for the MySQL account being used. Alias `Password` can also be used.
- **Database**: The default database that all statements are applied to. Default is `mysql`. Alias `Initial Catalog` can also be used.
- **Port**: The port MySQL is using to listen for connections. Default is `3306`. Specify `-1` for this value to use a named-pipe connection.

24.2.5.1.3. Opening a Connection

Once you have created a connection string it can be used to open a connection to the MySQL server.

The following code is used to create a `MySqlConnection` object, assign the connection string, and open the connection.

Visual Basic Example

```
Dim conn As New MySql.Data.MySqlClient.MySqlConnection
Dim myConnectionString as String

myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    conn.ConnectionString = myConnectionString
    conn.Open()

Catch ex As MySql.Data.MySqlClient.MySqlException
    MessageBox.Show(ex.Message)
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection();
    conn.ConnectionString = myConnectionString;
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message);
}
```

You can also pass the connection string to the constructor of the `MySqlConnection` class:

Visual Basic Example

```
Dim myConnectionString as String

myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    Dim conn As New MySql.Data.MySqlClient.MySqlConnection(myConnectionString)
    conn.Open()
Catch ex As MySql.Data.MySqlClient.MySqlException
    MessageBox.Show(ex.Message)
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection(myConnectionString);
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message);
}
```

Once the connection is open it can be used by the other Connector/.NET classes to communicate with the MySQL server.

24.2.5.1.4. Handling Connection Errors

Because connecting to an external server is unpredictable, it is important to add error handling to your .NET application. When there is an error connecting, the `MySqlConnection` class will return a `MySqlException` object. This object has two properties that are of interest when handling errors:

- **Message:** A message that describes the current exception.
- **Number:** The MySQL error number.

When handling errors, you can your application's response based on the error number. The two most common error numbers when connecting are as follows:

- **0:** Cannot connect to server.
- **1045:** Invalid username and/or password.

The following code shows how to adapt the application's response based on the actual error:

Visual Basic Example

```
Dim myConnectionString as String
myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    Dim conn As New MySql.Data.MySqlClient.MySqlConnection(myConnectionString)
    conn.Open()
Catch ex As MySql.Data.MySqlClient.MySqlException
    Select Case ex.Number
        Case 0
            MessageBox.Show("Cannot connect to server. Contact administrator")
        Case 1045
            MessageBox.Show("Invalid username/password, please try again")
    End Select
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection(myConnectionString);
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    switch (ex.Number)
    {
        case 0:
            MessageBox.Show("Cannot connect to server. Contact administrator");
        case 1045:
            MessageBox.Show("Invalid username/password, please try again");
    }
}
```

Important

Note that if you are using multilanguage databases you must specify the character set in the connection string. If you do not specify the character set, the connection defaults to the `latin1` charset. You can specify the character set as part of the connection string, for example:

```
MySqlConnection myConnection = new MySqlConnection("server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;Charset=latin1;");
```

24.2.5.2. Using the Connector/NET with Prepared Statements

24.2.5.2.1. Introduction

As of MySQL 4.1, it is possible to use prepared statements with Connector/NET. Use of prepared statements can provide significant performance improvements on queries that are executed more than once.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

24.2.5.2.2. Preparing Statements in Connector/NET

To prepare a statement, create a command object and set the `.CommandText` property to your query.

After entering your statement, call the `.Prepare` method of the `MySQLCommand` object. After the statement is prepared, add parameters for each of the dynamic elements in the query.

After you enter your query and enter parameters, execute the statement using the `.ExecuteNonQuery()`, `.ExecuteScalar()`, or `.ExecuteReader` methods.

For subsequent executions, you need only modify the values of the parameters and call the execute method again, there is no need to set the `.CommandText` property or redefine the parameters.

Visual Basic Example

```
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = strConnection

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "INSERT INTO myTable VALUES(NULL, ?number, ?text)"
    cmd.Prepare()

    cmd.Parameters.Add("?number", 1)
    cmd.Parameters.Add("?text", "One")

    For i = 1 To 1000
        cmd.Parameters["?number"].Value = i
        cmd.Parameters["?text"].Value = "A string value"

        cmd.ExecuteNonQuery()
    Next
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```
MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();

conn.ConnectionString = strConnection;

try
{
    conn.Open();
    cmd.Connection = conn;

    cmd.CommandText = "INSERT INTO myTable VALUES(NULL, ?number, ?text)";
    cmd.Prepare();

    cmd.Parameters.Add("?number", 1);
    cmd.Parameters.Add("?text", "One");

    for (int i=1; i <= 1000; i++)
    {
        cmd.Parameters["?number"].Value = i;
        cmd.Parameters["?text"].Value = "A string value";

        cmd.ExecuteNonQuery();
    }
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}
```

}

24.2.5.3. Accessing Stored Procedures with Connector/NET

24.2.5.3.1. Introduction

With the release of MySQL version 5 the MySQL server now supports stored procedures with the SQL 2003 stored procedure syntax.

A stored procedure is a set of SQL statements that can be stored in the server. Once this has been done, clients don't need to keep reissuing the individual statements but can refer to the stored procedure instead.

Stored procedures can be particularly useful in situations such as the following:

- When multiple client applications are written in different languages or work on different platforms, but need to perform the same database operations.
- When security is paramount. Banks, for example, use stored procedures for all common operations. This provides a consistent and secure environment, and procedures can ensure that each operation is properly logged. In such a setup, applications and users would not get any access to the database tables directly, but can only execute specific stored procedures.

Connector/NET supports the calling of stored procedures through the `MySQLCommand` object. Data can be passed in and out of a MySQL stored procedure through use of the `MySQLCommand.Parameters` collection.

Note

When you call a stored procedure, the command object makes an additional `SELECT` call to determine the parameters of the stored procedure. You must ensure that the user calling the procedure has the `SELECT` privilege on the `mysql.proc` table to enable them to verify the parameters. Failure to do this will result in an error when calling the procedure.

This section will not provide in-depth information on creating Stored Procedures. For such information, please refer to <http://dev.mysql.com/doc/mysql/en/stored-procedures.html>.

A sample application demonstrating how to use stored procedures with Connector/NET can be found in the `Samples` directory of your Connector/NET installation.

24.2.5.3.2. Creating Stored Procedures from Connector/NET

Stored procedures in MySQL can be created using a variety of tools. First, stored procedures can be created using the `mysql` command-line client. Second, stored procedures can be created using the `MySQL Query Browser` GUI client. Finally, stored procedures can be created using the `.ExecuteNonQuery` method of the `MySQLCommand` object:

Visual Basic Example

```
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = "server=127.0.0.1;" & _
    & "uid=root;" & _
    & "pwd=12345;" & _
    & "database=test"

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "CREATE PROCEDURE add_emp(" & _
        & "IN fname VARCHAR(20), IN lname VARCHAR(20), IN bday DATETIME, OUT empno INT) " & _
        & "BEGIN INSERT INTO emp(first_name, last_name, birthdate) " & _
        & "VALUES(fname, lname, DATE(bday)); SET empno = LAST_INSERT_ID(); END"

    cmd.ExecuteNonQuery()
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```
MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();
```

```

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn.Open();
    cmd.Connection = conn;

    cmd.CommandText = "CREATE PROCEDURE add_emp(" +
        "IN fname VARCHAR(20), IN lname VARCHAR(20), IN bday DATETIME, OUT empno INT) " +
        "BEGIN INSERT INTO emp(first_name, last_name, birthdate) " +
        "VALUES(fname, lname, DATE(bday)); SET empno = LAST_INSERT_ID(); END";

    cmd.ExecuteNonQuery();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

It should be noted that, unlike the command-line and GUI clients, you are not required to specify a special delimiter when creating stored procedures in Connector/NET.

24.2.5.3.3. Calling a Stored Procedure from Connector/NET

To call a stored procedure using Connector/NET, create a `MySqlCommand` object and pass the stored procedure name as the `.CommandText` property. Set the `.CommandType` property to `CommandType.StoredProcedure`.

After the stored procedure is named, create one `MySqlCommand` parameter for every parameter in the stored procedure. `IN` parameters are defined with the parameter name and the object containing the value, `OUT` parameters are defined with the parameter name and the datatype that is expected to be returned. All parameters need the parameter direction defined.

After defining parameters, call the stored procedure by using the `MySqlCommand.ExecuteNonQuery()` method:

Visual Basic Example

```

Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "add_emp"
    cmd.CommandType = CommandType.StoredProcedure

    cmd.Parameters.Add("?lname", 'Jones')
    cmd.Parameters["?lname"].Direction = ParameterDirection.Input

    cmd.Parameters.Add("?fname", 'Tom')
    cmd.Parameters["?fname"].Direction = ParameterDirection.Input

    cmd.Parameters.Add("?bday", #12/13/1977 2:17:36 PM#)
    cmd.Parameters["?bday"].Direction = ParameterDirection.Input

    cmd.Parameters.Add("?empno", MySqlDbType.Int32)
    cmd.Parameters["?empno"].Direction = ParameterDirection.Output

    cmd.ExecuteNonQuery()

    MessageBox.Show(cmd.Parameters["?empno"].Value)
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn.Open();
    cmd.Connection = conn;

```

```

cmd.CommandText = "add_emp";
cmd.CommandType = CommandType.StoredProcedure;

cmd.Parameters.Add("?lname", "Jones");
cmd.Parameters["?lname"].Direction = ParameterDirection.Input;

cmd.Parameters.Add("?fname", "Tom");
cmd.Parameters["?fname"].Direction = ParameterDirection.Input;

cmd.Parameters.Add("?bday", DateTime.Parse("12/13/1977 2:17:36 PM"));
cmd.Parameters["?bday"].Direction = ParameterDirection.Input;

cmd.Parameters.Add("?empno", MySqlDbType.Int32);
cmd.Parameters["?empno"].Direction = ParameterDirection.Output;

cmd.ExecuteNonQuery();

MessageBox.Show(cmd.Parameters["?empno"].Value);
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

Once the stored procedure is called, the values of output parameters can be retrieved by using the `.Value` property of the `MySqlConnection.Parameters` collection.

24.2.5.4. Handling BLOB Data With Connector/NET

24.2.5.4.1. Introduction

One common use for MySQL is the storage of binary data in **BLOB** columns. MySQL supports four different BLOB datatypes: `TINYBLOB`, `BLOB`, `MEDIUMBLOB`, and `LONGBLOB`.

Data stored in a BLOB column can be accessed using Connector/NET and manipulated using client-side code. There are no special requirements for using Connector/NET with BLOB data.

Simple code examples will be presented within this section, and a full sample application can be found in the `Samples` directory of the Connector/NET installation.

24.2.5.4.2. Preparing the MySQL Server

The first step in using MySQL with BLOB data is to configure the server. Let's start by creating a table to be accessed. In my file tables, I usually have four columns: an `AUTO_INCREMENT` column of appropriate size (`UNSIGNED SMALLINT`) to serve as a primary key to identify the file, a `VARCHAR` column that stores the filename, an `UNSIGNED MEDIUMINT` column that stores the size of the file, and a `MEDIUMBLOB` column that stores the file itself. For this example, I will use the following table definition:

```

CREATE TABLE file(
file_id SMALLINT UNSIGNED AUTO_INCREMENT NOT NULL PRIMARY KEY,
file_name VARCHAR(64) NOT NULL,
file_size MEDIUMINT UNSIGNED NOT NULL,
file MEDIUMBLOB NOT NULL);

```

After creating a table, you may need to modify the `max_allowed_packet` system variable. This variable determines how large of a packet (i.e. a single row) can be sent to the MySQL server. By default, the server will only accept a maximum size of 1 meg from our client application. If you do not intend to exceed 1 meg, this should be fine. If you do intend to exceed 1 meg in your file transfers, this number has to be increased.

The `max_allowed_packet` option can be modified using MySQL Administrator's Startup Variables screen. Adjust the Maximum allowed option in the Memory section of the Networking tab to an appropriate setting. After adjusting the value, click the `APPLY CHANGES` button and restart the server using the `Service Control` screen of MySQL Administrator. You can also adjust this value directly in the `my.cnf` file (add a line that reads `max_allowed_packet=xxM`), or use the `SET max_allowed_packet=xxM`; syntax from within MySQL.

Try to be conservative when setting `max_allowed_packet`, as transfers of BLOB data can take some time to complete. Try to set a value that will be adequate for your intended use and increase the value if necessary.

24.2.5.4.3. Writing a File to the Database

To write a file to a database we need to convert the file to a byte array, then use the byte array as a parameter to an `INSERT` query.

The following code opens a file using a `FileStream` object, reads it into a byte array, and inserts it into the `file` table:

Visual Basic Example

```

Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

Dim SQL As String

Dim FileSize As UInt32
Dim rawData() As Byte
Dim fs As FileStream

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    fs = New FileStream("c:\image.png", FileMode.Open, FileAccess.Read)
    FileSize = fs.Length

    rawData = New Byte(FileSize) {}
    fs.Read(rawData, 0, FileSize)
    fs.Close()

    conn.Open()

    SQL = "INSERT INTO file VALUES(NULL, ?FileName, ?FileSize, ?File)"

    cmd.Connection = conn
    cmd.CommandText = SQL
    cmd.Parameters.Add("?FileName", strFileName)
    cmd.Parameters.Add("?FileSize", FileSize)
    cmd.Parameters.Add("?File", rawData)

    cmd.ExecuteNonQuery()

    MessageBox.Show("File Inserted into database successfully!", _
        "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk)

    conn.Close()
Catch ex As Exception
    MessageBox.Show("There was an error: " & ex.Message, "Error", _
        MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();

string SQL;
UInt32 FileSize;
byte[] rawData;
FileStream fs;

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    fs = new FileStream(@"c:\image.png", FileMode.Open, FileAccess.Read);
    FileSize = fs.Length;

    rawData = new byte[FileSize];
    fs.Read(rawData, 0, FileSize);
    fs.Close();

    conn.Open();

    SQL = "INSERT INTO file VALUES(NULL, ?FileName, ?FileSize, ?File)";

    cmd.Connection = conn;
    cmd.CommandText = SQL;
    cmd.Parameters.Add("?FileName", strFileName);
    cmd.Parameters.Add("?FileSize", FileSize);
    cmd.Parameters.Add("?File", rawData);

    cmd.ExecuteNonQuery();

    MessageBox.Show("File Inserted into database successfully!",
        "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk);

    conn.Close();
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

The `Read` method of the `FileStream` object is used to load the file into a byte array which is sized according to the `Length` property of the `FileStream` object.

After assigning the byte array as a parameter of the `MySQLCommand` object, the `ExecuteNonQuery` method is called and the BLOB is inserted into the `file` table.

24.2.5.4.4. Reading a BLOB from the Database to a File on Disk

Once a file is loaded into the `file` table, we can use the `MySQLDataReader` class to retrieve it.

The following code retrieves a row from the `file` table, then loads the data into a `FileStream` object to be written to disk:

Visual Basic Example

```
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myData As MySQLDataReader
Dim SQL As String
Dim rawData() As Byte
Dim FileSize As UInt32
Dim fs As FileStream

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

SQL = "SELECT file_name, file_size, file FROM file"

Try
    conn.Open()

    cmd.Connection = conn
    cmd.CommandText = SQL

    myData = cmd.ExecuteReader

    If Not myData.HasRows Then Throw New Exception("There are no BLOBs to save")

    myData.Read()

    FileSize = myData.GetUInt32(myData.GetOrdinal("file_size"))
    rawData = New Byte(FileSize) {}

    myData.GetBytes(myData.GetOrdinal("file"), 0, rawData, 0, FileSize)

    fs = New FileStream("C:\newfile.png", FileMode.OpenOrCreate, FileAccess.Write)
    fs.Write(rawData, 0, FileSize)
    fs.Close()

    MessageBox.Show("File successfully written to disk!", "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk)

    myData.Close()
    conn.Close()
Catch ex As Exception
    MessageBox.Show("There was an error: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```
MySQL.Data.MySQLClient.MySqlConnection conn;
MySQL.Data.MySQLClient.MySqlCommand cmd;
MySQL.Data.MySQLClient.MySQLDataReader myData;

conn = new MySQL.Data.MySQLClient.MySqlConnection();
cmd = new MySQL.Data.MySQLClient.MySqlCommand();

string SQL;
UInt32 FileSize;
byte[] rawData;
FileStream fs;

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

SQL = "SELECT file_name, file_size, file FROM file";

try
{
    conn.Open();

    cmd.Connection = conn;
    cmd.CommandText = SQL;

    myData = cmd.ExecuteReader();

    if (! myData.HasRows)
        throw new Exception("There are no BLOBs to save");
```

```

myData.Read();
FileSize = myData.GetUInt32(myData.GetOrdinal("file_size"));
rawData = new byte[FileSize];

myData.GetBytes(myData.GetOrdinal("file"), 0, rawData, 0, FileSize);

fs = new FileStream(@"C:\newfile.png", FileMode.OpenOrCreate, FileAccess.Write);
fs.Write(rawData, 0, FileSize);
fs.Close();

MessageBox.Show("File successfully written to disk!",
    "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk);

myData.Close();
conn.Close();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

After connecting, the contents of the `file` table are loaded into a `MySqlDataReader` object. The `GetBytes` method of the `MySqlDataReader` is used to load the BLOB into a byte array, which is then written to disk using a `FileStream` object.

The `GetOrdinal` method of the `MySqlDataReader` can be used to determine the integer index of a named column. Use of the `GetOrdinal` method prevents errors if the column order of the `SELECT` query is changed.

24.2.5.5. Using Connector/NET with Crystal Reports

24.2.5.5.1. Introduction

Crystal Reports is a common tool used by Windows application developers to perform reporting and document generation. In this section we will show how to use Crystal Reports XI with MySQL and Connector/NET.

24.2.5.5.2. Creating a Data Source

When creating a report in Crystal Reports there are two options for accessing the MySQL data while designing your report.

The first option is to use Connector/ODBC as an ADO data source when designing your report. You will be able to browse your database and choose tables and fields using drag and drop to build your report. The disadvantage of this approach is that additional work must be performed within your application to produce a dataset that matches the one expected by your report.

The second option is to create a dataset in VB.NET and save it as XML. This XML file can then be used to design a report. This works quite well when displaying the report in your application, but is less versatile at design time because you must choose all relevant columns when creating the dataset. If you forget a column you must re-create the dataset before the column can be added to the report.

The following code can be used to create a dataset from a query and write it to disk:

Visual Basic Example

```

Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=world"

Try
    conn.Open()
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " _
        & "country.name, country.population, country.continent " _
        & "FROM country, city ORDER BY country.continent, country.name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myData.WriteXml("C:\dataset.xml", XmlWriteMode.WriteSchema)
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

DataSet myData = new DataSet();
MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;
MySQL.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();
myAdapter = new MySQL.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " +
        "country.name, country.population, country.continent " +
        "FROM country, city ORDER BY country.continent, country.name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);

    myData.WriteXml(@"C:\dataset.xml", XmlWriteMode.WriteSchema);
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

The resulting XML file can be used as an ADO.NET XML datasource when designing your report.

If you choose to design your reports using Connector/ODBC, it can be downloaded from dev.mysql.com.

24.2.5.5.3. Creating the Report

For most purposes the Standard Report wizard should help with the initial creation of a report. To start the wizard, open Crystal Reports and choose the New > Standard Report option from the File menu.

The wizard will first prompt you for a data source. If you are using Connector/ODBC as your data source, use the OLEDB provider for ODBC option from the OLE DB (ADO) tree instead of the ODBC (RDO) tree when choosing a data source. If using a saved dataset, choose the ADO.NET (XML) option and browse to your saved dataset.

The remainder of the report creation process is done automatically by the wizard.

After the report is created, choose the Report Options... entry of the File menu. Un-check the Save Data With Report option. This prevents saved data from interfering with the loading of data within our application.

24.2.5.5.4. Displaying the Report

To display a report we first populate a dataset with the data needed for the report, then load the report and bind it to the dataset. Finally we pass the report to the crViewer control for display to the user.

The following references are needed in a project that displays a report:

- CrystalDecisions.CrystalReports.Engine
- CrystalDecisions.ReportSource
- CrystalDecisions.Shared
- CrystalDecisions.Windows.Forms

The following code assumes that you created your report using a dataset saved using the code shown in [Section 24.2.5.5.2, "Creating a Data Source"](#), and have a crViewer control on your form named `myViewer`.

Visual Basic Example

```

Imports CrystalDecisions.CrystalReports.Engine
Imports System.Data
Imports MySQL.Data.MySqlClient

Dim myReport As New ReportDocument
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = _

```

```

"server=127.0.0.1;" _
& "uid=root;" _
& "pwd=12345;" _
& "database=test"

Try
    conn.Open()

    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " _
        & "country.name, country.population, country.continent " _
        & "FROM country, city ORDER BY country.continent, country.name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myReport.Load(".\world_report.rpt")
    myReport.SetDataSource(myData)
    myViewer.ReportSource = myReport
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

using CrystalDecisions.CrystalReports.Engine;
using System.Data;
using MySql.Data.MySqlClient;

ReportDocument myReport = new ReportDocument();
DataSet myData = new DataSet();
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
myAdapter = new MySql.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " +
        "country.name, country.population, country.continent " +
        "FROM country, city ORDER BY country.continent, country.name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);

    myReport.Load(@".\world_report.rpt");
    myReport.SetDataSource(myData);
    myViewer.ReportSource = myReport;
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

A new dataset is generated using the same query used to generate the previously saved dataset. Once the dataset is filled, a `ReportDocument` is used to load the report file and bind it to the dataset. The `ReportDocument` is passed as the `ReportSource` of the `crViewer`.

This same approach is taken when a report is created from a single table using `Connector/ODBC`. The dataset replaces the table used in the report and the report is displayed properly.

When a report is created from multiple tables using `Connector/ODBC`, a dataset with multiple tables must be created in our application. This allows each table in the report data source to be replaced with a report in the dataset.

We populate a dataset with multiple tables by providing multiple `SELECT` statements in our `MySqlCommand` object. These `SELECT` statements are based on the SQL query shown in Crystal Reports in the Database menu's Show SQL Query option. Assume the following query:

```

SELECT `country`.`Name`, `country`.`Continent`, `country`.`Population`, `city`.`Name`, `city`.`Population`
FROM `world`.`country` `country` LEFT OUTER JOIN `world`.`city` `city` ON `country`.`Code`=`city`.`CountryCode`
ORDER BY `country`.`Continent`, `country`.`Name`, `city`.`Name`

```

This query is converted to two `SELECT` queries and displayed with the following code:

Visual Basic Example

```

Imports CrystalDecisions.CrystalReports.Engine
Imports System.Data

```

```
Imports MySql.Data.MySqlClient

Dim myReport As New ReportDocument
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=world"

Try
    conn.Open()
    cmd.CommandText = "SELECT name, population, countrycode FROM city ORDER BY countrycode, name;" _
        & "SELECT name, population, code, continent FROM country ORDER BY continent, name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myReport.Load(".\world_report.rpt")
    myReport.Database.Tables(0).SetDataSource(myData.Tables(0))
    myReport.Database.Tables(1).SetDataSource(myData.Tables(1))
    myViewer.ReportSource = myReport
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```
using CrystalDecisions.CrystalReports.Engine;
using System.Data;
using MySql.Data.MySqlClient;

ReportDocument myReport = new ReportDocument();
DataSet myData = new DataSet();
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
myAdapter = new MySql.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT name, population, countrycode FROM city ORDER " +
        "BY countrycode, name; SELECT name, population, code, continent FROM " +
        "country ORDER BY continent, name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);

    myReport.Load(@".\world_report.rpt");
    myReport.Database.Tables(0).SetDataSource(myData.Tables(0));
    myReport.Database.Tables(1).SetDataSource(myData.Tables(1));
    myViewer.ReportSource = myReport;
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}
```

It is important to order the [SELECT](#) queries in alphabetical order, as this is the order the report will expect its source tables to be in. One `SetDataSource` statement is needed for each table in the report.

This approach can cause performance problems because Crystal Reports must bind the tables together on the client-side, which will be slower than using a pre-saved dataset.

24.2.5.6. Handling Date and Time Information in Connector/.NET

24.2.5.6.1. Introduction

MySQL and the .NET languages handle date and time information differently, with MySQL allowing dates that cannot be represented by a .NET data type, such as '0000-00-00 00:00:00'. These differences can cause problems if not properly handled.

In this section we will demonstrate how to properly handle date and time information when using Connector/.NET.

24.2.5.6.2. Problems when Using Invalid Dates

The differences in date handling can cause problems for developers who use invalid dates. Invalid MySQL dates cannot be loaded into native .NET `DateTime` objects, including `NULL` dates.

Because of this issue, .NET `DataSet` objects cannot be populated by the `Fill` method of the `MySqlDataAdapter` class as invalid dates will cause a `System.ArgumentOutOfRangeException` exception to occur.

24.2.5.6.3. Restricting Invalid Dates

The best solution to the date problem is to restrict users from entering invalid dates. This can be done on either the client or the server side.

Restricting invalid dates on the client side is as simple as always using the .NET `DateTime` class to handle dates. The `DateTime` class will only allow valid dates, ensuring that the values in your database are also valid. The disadvantage of this is that it is not useful in a mixed environment where .NET and non .NET code are used to manipulate the database, as each application must perform its own date validation.

Users of MySQL 5.0.2 and higher can use the new `traditional` SQL mode to restrict invalid date values. For information on using the `traditional` SQL mode, see [Section 5.2.6, "SQL Modes"](#).

24.2.5.6.4. Handling Invalid Dates

Although it is strongly recommended that you avoid the use of invalid dates within your .NET application, it is possible to use invalid dates by means of the `MySqlDateTime` datatype.

The `MySqlDateTime` datatype supports the same date values that are supported by the MySQL server. The default behavior of Connector/NET is to return a .NET `DateTime` object for valid date values, and return an error for invalid dates. This default can be modified to cause Connector/NET to return `MySqlDateTime` objects for invalid dates.

To instruct Connector/NET to return a `MySqlDateTime` object for invalid dates, add the following line to your connection string:

```
Allow Zero Datetime=True
```

Please note that the use of the `MySqlDateTime` class can still be problematic. The following are some known issues:

1. Data binding for invalid dates can still cause errors (zero dates like 0000-00-00 do not seem to have this problem).
2. The `ToString` method return a date formatted in the standard MySQL format (for example, 2005-02-23 08:50:25). This differs from the `ToString` behavior of the .NET `DateTime` class.
3. The `MySqlDateTime` class supports `NULL` dates, while the .NET `DateTime` class does not. This can cause errors when trying to convert a `MySqlDateTime` to a `DateTime` if you do not check for `NULL` first.

Because of the known issues, the best recommendation is still to use only valid dates in your application.

24.2.5.6.5. Handling NULL Dates

The .NET `DateTime` datatype cannot handle `NULL` values. As such, when assigning values from a query to a `DateTime` variable, you must first check whether the value is in fact `NULL`.

When using a `MySqlDataReader`, use the `.IsDBNull` method to check whether a value is `NULL` before making the assignment:

Visual Basic Example

```
If Not myReader.IsDBNull(myReader.GetOrdinal("mytime")) Then
    myTime = myReader.GetDateTime(myReader.GetOrdinal("mytime"))
Else
    myTime = DateTime.MinValue
End If
```

C# Example

```
if (! myReader.IsDBNull(myReader.GetOrdinal("mytime")))
    myTime = myReader.GetDateTime(myReader.GetOrdinal("mytime"));
else
    myTime = DateTime.MinValue;
```

`NULL` values will work in a dataset and can be bound to form controls without special handling.

24.2.6. Connector/NET Support

The developers of Connector/NET greatly value the input of our users in the software development process. If you find Connector/NET lacking some feature important to you, or if you discover a bug and need to file a bug report, please use the instructions in [Section 1.8, “How to Report Bugs or Problems”](#).

24.2.6.1. Connector/NET Community Support

- Community support for Connector/NET can be found through the forums at <http://forums.mysql.com>.
- Community support for Connector/NET can also be found through the mailing lists at <http://lists.mysql.com>.
- Paid support is available from MySQL AB. Additional information is available at <http://www.mysql.com/support/>.

24.2.6.2. How to report Connector/NET Problems or Bugs

If you encounter difficulties or problems with Connector/NET, contact the Connector/NET community [Section 24.2.6.1, “Connector/NET Community Support”](#).

You should first try to execute the same SQL statements and commands from the `mysql` client program or from `admindemo`. This helps you determine whether the error is in Connector/NET or MySQL.

If reporting a problem, you should ideally include the following information with the email:

- Operating system and version
- Connector/NET version
- MySQL server version
- Copies of error messages or other unexpected output
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

If you believe the problem to be a bug, then you must report the bug through <http://bugs.mysql.com/>.

24.2.6.3. Connector/NET Change History

The Connector/NET Change History (Changelog) is located with the main Changelog for MySQL. See [Section E.4, “Connector/NET Change History”](#).

24.3. MySQL Visual Studio Plugin

The MySQL Visual Studio Plugin is a DDEX provider; a plug-in for Visual Studio 2005 that allows developers to maintain database structures, and supports built-in data-driven application development tools.

The current version of the MySQL Visual Studio Plugin includes only database maintenance tools. Data-driven application development tools are not supported.

The MySQL DDEX Provider operates as a standard extension to the Visual Studio Data Designer functionality available through the Server Explorer menu of Visual Studio 2005, and enables developers to create database objects and data within a MySQL database.

The MySQL Visual Studio Plugin is designed to work with MySQL version 5.0, but is also compatible with MySQL 4.1.1 and provides limited compatibility with MySQL 5.1.

24.3.1. Installing the MySQL Visual Studio Plugin

The MySQL Visual Studio Plugin requires one of Visual Studio 2005 Standard, Professional or Team Developer Edition to be installed. Other editions of Visual Studio 2005 are not supported.

Note

Starting with Connector/NET 5.1.2, the Visual Studio Plugin is included in the installation. If you have installed Connector/NET 5.1.2, then you do not need to separately install the Visual Studio Plugin.

Here is the list of components that should already be installed before starting the installation of the MySQL Visual Studio Plugin:

- Visual Studio 2005 Standard, Professional or Team Developer Edition.
- MySQL Server 4.1.1 or later (either installed on the same machine, or a separate server).
- MySQL Connector/NET 5.0.

Note

When installing Connector/NET you must ensure that the connector is installed into the Global Assembly Cache (GAC). The Connector/NET installer handles this for you automatically, but in a custom installation the option may have been disabled.

The user used to connect to the MySQL server must have the following privileges to use the functionality provided by the MySQL Visual Studio Plugin:

- The **SELECT** privilege for the **INFORMATION_SCHEMA** database.
- The **EXECUTE** privilege for the **SHOW CREATE TABLE** statement.
- The **SELECT** privilege for the **mysql.proc** table (required for operations with stored procedures and functions).
- The **SELECT** privilege for the **mysql.func** table (required for operations with User Defined Functions (UDF)).
- The **EXECUTE** privilege for the **SHOW ENGINE STATUS** statement (required for retrieving extended error information).
- Appropriate privileges for performed operations (e.g. the **SELECT** privilege is required to browse data from a table etc.).

The MySQL Visual Studio Plugin is delivered as a MSI package that can be used to install, uninstall or reinstall the Provider. If you are not using Windows XP or Windows Server 2003 you upgrade the Windows Installer system to the latest version (see <http://support.microsoft.com/default.aspx?scid=kb;EN-US;292539> for details).

The MSI-package is named **MySQL.VisualStudio.msi**. To install the MySQL Visual Studio Plugin, right click on the MSI file and select **INSTALL**. The installation process is as follow:

1. The standard Welcome dialog is opened. Click Next to continue installation.
2. The License agreement (GNU GPL) window is opened. Accept the agreement and click NEXT to continue.
3. The destination folder choice dialog is opened. Here you can point out the folder where the MySQL Visual Studio Plugin will be installed. The default destination folder is **%ProgramFilesDir%\MySQL\MySQL DDEX Data Provider**, where **%ProgramFilesDir%** is the Program Files folder of the installation machine. After choosing the destination folder, click NEXT to continue.
4. The installer will ask to confirm that installation. Click Install to start installation process.
5. The installation will now take place. At the end of this step the Visual Studio command table is rebuilt (this process may take several minutes).
6. Once installation is complete, click FINISH to end the installation process.

To uninstall the MySQL Visual Studio Plugin, you can use either Add/Remove Programs component of the Control Panel or the same MSI-package. Choose the **REMOVE** option, and the Provider will be uninstalled automatically.

To repair the Provider, right click the MSI-package and choose the **REPAIR** option. The MySQL Visual Studio Plugin will be repaired automatically.

The installation package includes the following files:

- `MySQL.VisualStudio.dll` — the MySQL DDEX Provider assembly.
- `MySQL.Data.dll` — the assembly containing the MySQL Connector .NET which is used by the Provider.
- `MySQL.VisualStudio.dll.config` — the configuration file for the MySQL Visual Studio Plugin. This file contains default values for the provider GUI layout.

Note

Do not remove this file before the first use of the Provider.

- `Register.reg` — the file with registry entries that can be used to register the MySQL DDEX Provider in the case of the manual installation.
- `Install.js` — the script used to register the Connector .NET as an ADO.NET data provider in the machine.config file.
- `Release notes.doc` — the document with release notes.

To install the Provider manually, copy all files of the installation package in a desired folder, then set the full path to the Provider assembly as a value of the CodeBase entry. For example:

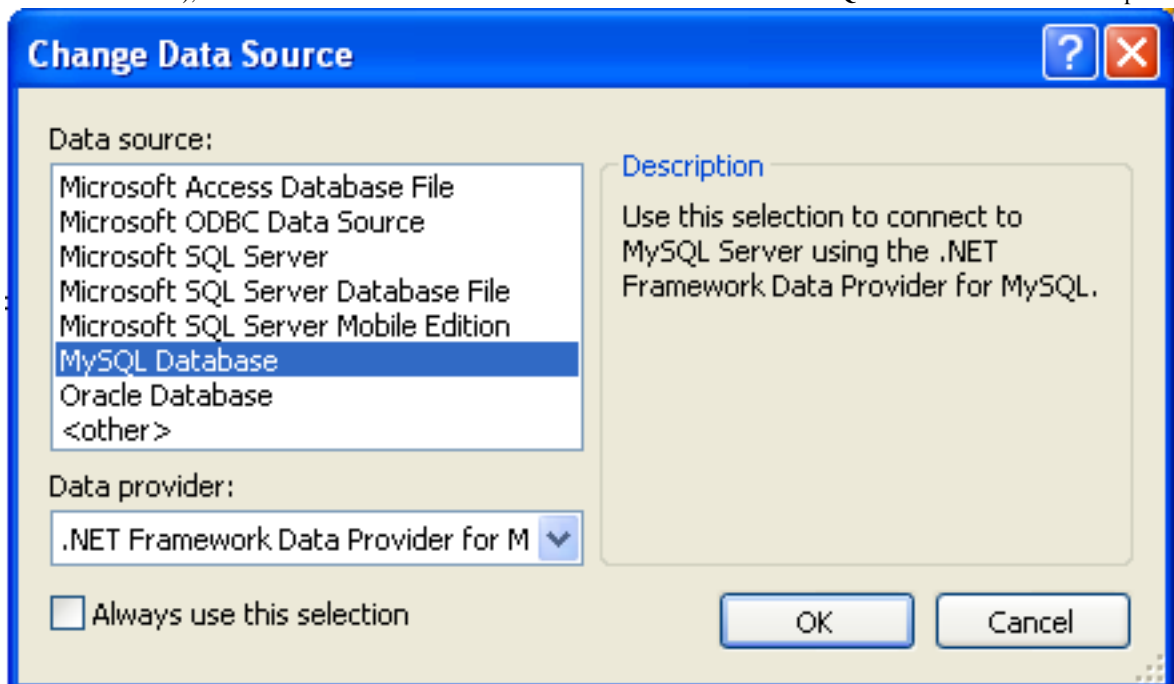

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\VisualStudio\8.0\Packages\{79A115C9-B133-4891-9E7B-242509DAD272}]@="MySQL.Data.
"InprocServer32"="C:\WINNT\system32\mscoree.dll"
"Class"="MySQL.Data.VisualStudio.MySqlDataProviderPackage"
"CodeBase"="C:\MySQLDdexProvider\MySQL.VisualStudio.dll"
```

Then import information from the Register.reg file to the registry by clicking of the file. At the confirmation dialog choose Yes. Next you must run the command `devenv.exe /setup` within a Command Prompt to rebuild the Visual Studio command table.

24.3.2. Creating a connection to the MySQL server

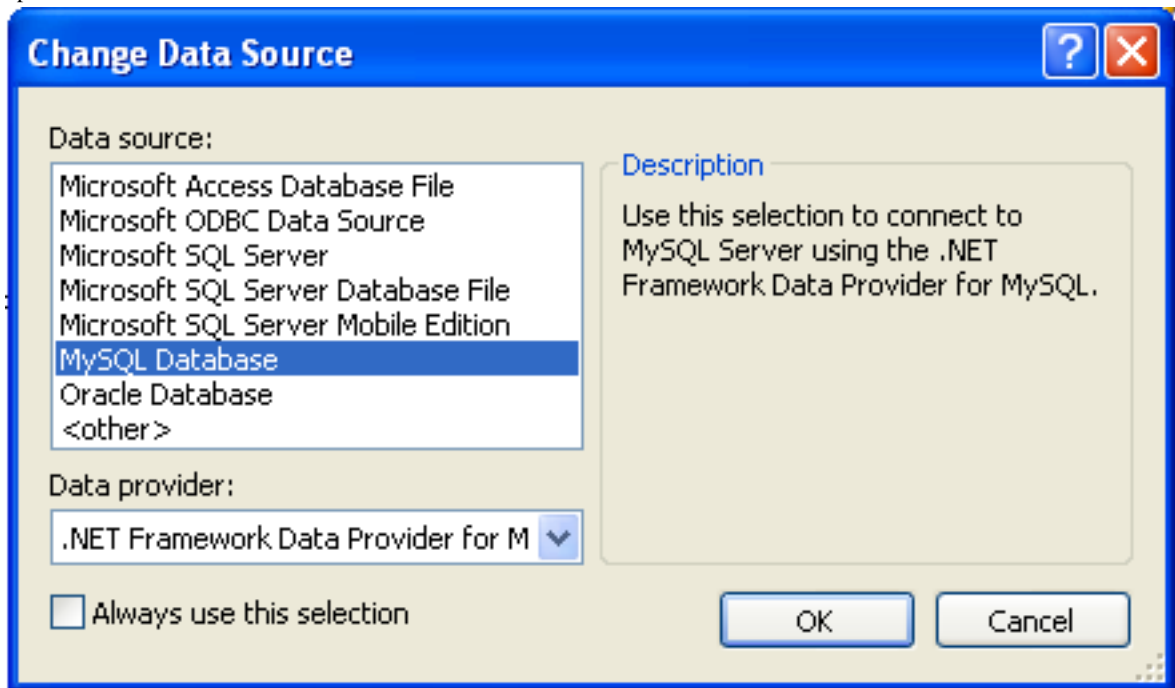

Once the MySQL Visual Studio Plugin is installed, you can use it to create, modify and delete connections to MySQL databases. To create a connection with a MySQL database, perform the following steps:

1. Start Visual Studio 2005 and open Server Explorer window by choosing the **SERVER EXPLORER** option from the **VIEW** menu.
2. Right click on the **DATA CONNECTIONS** node and choose the **ADD CONNECTION** button.
3. The Add Connection dialog is opened. Press the **CHANGE** button to choose MySQL Database as a data source.
4. Change Data Source dialog is opened. Choose MySQL Database in the list of data sources (or the **other** option, if MySQL Database is absent), and then choose **.NET FRAMEWORK DATA PROVIDER FOR MYSQL** in the combo box of data providers.

Press OK to confirm your choice.

5. Enter the connection settings: the server host name (for example, localhost if the MySQL server is installed on the local machine), the user name, the password, and the default database schema. Note that you must specify the default schema name to open the connection.

6. You can also set the port to connect with the MySQL server by pressing the ADVANCED button. To test a connection with the MySQL server, set the server host name, the user name, and the password, and press the TEST CONNECTION button. If the test fails, check the connection values that you have supplied are correct and that the corresponding user and privileges have been configured on the MySQL server.
7. After you set all settings and test the connection, press OK. The newly created connection is displayed in Server Explorer. Now you can work with the MySQL server through standard Server Explorer interface.

After a connection is successfully established, all the connection settings are saved. When you next open Visual Studio, the connection to the MySQL server will appear within Server Explorer so that you can re-establish a connection to the MySQL server.

To modify and delete a connection, use the **SERVER EXPLORER** context menu for the corresponding node. You can modify any of the settings just by overwriting the existing values with new ones. Note that a connection should be modified or deleted only if no active editor for its objects is opened. Otherwise your data could be lost.

24.3.3. Using the MySQL Visual Studio Plugin

To work with a MySQL server using the MySQL Visual Studio Plugin, open the Visual Studio 2005, open the **SERVER EXPLORER**, and select the required connection. The working area of the MySQL Visual Studio Plugin consists of three parts.

- Database objects (tables, views, stored routines, triggers, and user defined functions) are displayed in the Server Explorer tree. Here you can choose an object and edit its properties and definition.
- Properties of a selected database object are displayed in the **PROPERTIES** panel. Certain properties can be edited directly within this window.
- The editor panel provides direct access to the SQL statement and definition of specific objects. For example, the SQL statements within a stored procedure definition are shown and edited within this panel.

24.3.3.1. Editing Tables

The Table Editor can be accessed through a mouse action on table-type node of Server Explorer. To create a new table, right click on the **TABLES** node (under the connection node) and choose the **CREATE TABLE** command from a context menu. To modify an existing table, double click on a node of the table you wish to modify, or right click on this node and choose the **ALTER TABLE** command from a context menu. Either of the commands opens the Table Editor.

The MySQL Visual Studio Plugin Table Editor is implemented in a similar fashion to the standard Query Browser Table Editor, but with minor differences.

The Table Editor consists of the following parts:

- Columns Editor — for column creation, modification and deletion.
- Indexes tab — for table/column index management.
- Foreign Keys tab — for configuration of foreign keys.
- Column Details tab — used to set advanced column options.
- Properties window — used to set table properties.

To save changes you have made in the Table Editor, use either Save or Save All buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. Before changes are saved, a confirmation dialog will be displayed to confirm that you want to update the corresponding object within the MySQL database.

24.3.3.1.1. Column Editor

You can use the Column Editor to set or change the name, data type, default value and other properties of a table column. To set the properties of an individual column, select the column using the mouse. Alternatively, you can move through the grid using **Tab** and **Shift+Tab** keys.

- To set or change the name, data type, default value and comment of a column, select the appropriate cell and edit the desired value.
- To set or unset flag-type column properties (i.e., primary key, **NOT NULL**, auto-incremented, flags), check or uncheck the corresponding checkboxes. Note that the available column flags will depend on the columns data type.
- To reorder columns, index columns or foreign key columns in the Column Editor, select the whole column you wish to reorder by clicking on the selector column at the left of the column grid. Then move the column by using **Ctrl+Up** (to move the

column up) and **Ctrl+Down** (to move the column down) keys.

- To delete a column, select it by clicking on the selector column at the left of the column grid, then press the **Delete** button on a keyboard.

24.3.3.1.2. Indexes tab

Index management is performed via the Indexes tab.

- To add an index, press the + button and set the properties in the **INDEX SETTINGS** groupbox at the right. You can set the index name, index kind, index type and a set of index columns.
- To remove an index, select the index from the list and press the - button.
- To change index settings, select the index from the list; detailed information about the index is displayed in the **INDEX SETTINGS** panel.

You cannot change a table column to an index column using drag and drop. Instead, you can add new index columns to a table and set their table columns by using the embedded editor within the Indexes tab

24.3.3.1.3. Foreign Keys tab

Foreign Key management is performed via the Foreign Keys tab.

- To add a foreign key, press the + button and set properties in the **FOREIGN KEYS SETTINGS** panel. You can set the foreign key name, referenced table name, foreign key columns and actions on update and delete.
- To remove a foreign key, select the foreign key and press the - button.
- To change foreign key settings, select the foreign key and use the **FOREIGN KEYS SETTINGS** panel to edit the properties.
- When a foreign key is changed, the MySQL Visual Studio Plugin generates two queries: the first query drops the changed keys and the second one recreates the new values. The reason for such a behavior is to avoid the [Bug#8377](#) and [Bug#8919](#).

Note

If changed values are for some reason inconsistent and cause the second query to fail, all affected foreign keys will be dropped. If this is the case, the MySQL Visual Studio Plugin will mark them as new in the Table Editor, and you will have to recreate them later. But if you close the Table Editor without saving, these foreign keys will be lost.

24.3.3.1.4. Column Details tab

The Column Details tab can be used to set column options. Besides the main column properties that are presented in the Column Editor, in the Column Details tab you can set two additional properties options: the character set and the collation sequence.

24.3.3.1.5. Table Properties window

There is no separate tab for table options and advanced options. All table options can be browsed and changed using the **PROPERTIES** window of Visual Studio 2005.

The following table properties can be set:

- **AUTO INCREMENT**
- **AVERAGE ROW LENGTH**
- **CHARACTER SET**
- **CHECKSUM FOR ROWS**
- **COLLATION**
- **COMMENT**
- **CONNECTION**

- **DATA DIRECTORY**
- **DELAY KEY UPDATES**
- **ENGINE**
- **INDEX DIRECTORY**
- **INSERT METHOD**
- **MAXIMUM ROWS**
- **MINIMUM ROWS**
- **NAME**
- **PACK KEYS**
- **PASSWORD**
- **ROW FORMAT**
- **UNION**

Some of these properties can have arbitrary text values, others accept values from a predefined set.

The properties **SCHEMA** and **SERVER** are read only.

24.3.3.2. Editing Table Data

The Table Data Editor, allows a user to browse, create and edit data of tables. The Table Data Editor is implemented as a simple data grid with auto generated columns.

To access the Table Data Editor, right click on a node representing the table or view in Server Explorer. From the nodes context menu, choose the **BROWSE** or **EDIT DATA** command. For tables and updatable views, this command opens the Table Data Editor in edit mode. For non-updatable views, this command opens the Table Data Editor in read-only mode.

When in the edit mode, you can modify table data by modifying the displayed table contents directly. To add a row, set desired values in the last row of the grid. To modify values, set new values in appropriate cells. To delete a row, select it by clicking on the selector column at the left of the grid, then press the **DELETE** button.

To save changes you have made in the Table Data Editor, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

24.3.3.3. Editing Views

To create a new view, right click the Views node under the connection node in Server Explorer. From the nodes context menu, choose the **CREATE VIEW** command. This command opens the SQL Editor.

To modify an existing view, double click on a node of the view you wish to modify, or right click on this node and choose the **ALTER VIEW** command from a context menu. Either of the commands opens the SQL Editor.

To create or alter the view definition using SQL Editor, type the appropriate SQL statement in the SQL Editor.

Note

You should enter only the defining statement itself, without the **CREATE VIEW AS** preface.

All other view properties can be set in the **PROPERTIES** window. These properties are:

- **ALGORITHM**
- **CHECK OPTION**
- **DEFINER**
- **NAME**
- **SECURITY TYPE**

Some of these properties can have arbitrary text values, others accept values from a predefined set.

The properties **IS UPDATABLE**, **SCHEMA** and **SERVER** are read-only.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

24.3.3.4. Editing Stored Procedures and Functions

To create a new stored procedure, right click the Stored Procedures node under the connection node in Server Explorer. From the nodes context menu, choose the **CREATE ROUTINE** command. This command opens the SQL Editor.

To create a new stored function, right click the **FUNCTIONS** node under the connection node in Server Explorer. From the node's context menu, choose the **CREATE ROUTINE** command.

To modify an existing stored routine (procedure or function), double click on a node of the routine you wish to modify, or right click on this node and choose the **ALTER ROUTINE** command from a context menu. Either of the commands opens the SQL Editor.

To create or alter the routine definition using SQL Editor, type this definition in the SQL Editor using standard SQL.

All other routine properties can be set in the **PROPERTIES** window. These properties are:

- Comment
- Data Access
- Definer
- Is Deterministic
- Security Type

Some of these properties can have arbitrary text values, others accept values only from a predefined set.

Also you can set all the options directly in the SQL Editor, using the standard **CREATE PROCEDURE** or **CREATE FUNCTION** statement. However, it is recommended to use the **PROPERTIES** window instead.

Note

You should never add the **CREATE** preface to the routine definition.

The properties **NAME**, **SCHEMA** and **SERVER** in the **PROPERTIES** window are read-only. Set or change the procedure name in the SQL editor.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database..

24.3.3.5. Editing Triggers

To create a new trigger, right click on a node of a table for which you wish to add a trigger. From the node's context menu, choose the **CREATE TRIGGER** command. This command opens the SQL Editor.

To modify an existing trigger, double click on a node of the trigger you wish to modify, or right click on this node and choose the **ALTER TRIGGER** command from a context menu. Either of the commands opens the SQL Editor.

To create or alter the trigger definition using SQL Editor, type the trigger statement in the SQL Editor using standard SQL.

Note

You should enter only the trigger statement, that is the part of the **CREATE TRIGGER** query that is placed after the **FOR EACH ROW** clause.

All other trigger properties are set in the **PROPERTIES** window. These properties are:

- **DEFINER**
- **EVENT MANIPULATION**

- **NAME**
- **TIMING**

Some of these properties can have arbitrary text values, others accept values only from a predefined set.

The properties **EVENT TABLE**, **SCHEMA** and **SERVER** in the **PROPERTIES** window are read-only.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

24.3.3.6. Editing User Defined Functions (UDF)

To create a new User Defined Function (UDF), right click the UDFs node under the connection node in Server Explorer. From the node's context menu, choose the **CREATE UDF** command. This command opens the UDF Editor.

To modify an existing UDF, double click on a node of the UDF you wish to modify, or right click on this node and choose the **Alter UDF** command from a context menu. Either of the commands opens the UDF Editor.

The UDF editor allows you to set the following properties through the properties panel:

- **NAME**
- **SO-NAME (DLL NAME)**
- **RETURN TYPE**
- **IS AGGREGATE**

The property **Server** in the **PROPERTIES** window is read-only.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

24.3.3.7. Dropping database objects

Tables, views, stored routines, triggers, and UDFs can be dropped with the appropriate **DROP** command from its context menu: **DROP TABLE**, **DROP VIEW**, **DROP ROUTINE**, **DROP TRIGGER**, **DROP UDF**.

You will be asked to confirm the execution of the corresponding drop query in a confirmation dialog.

Dropping of multiple objects is not supported.

24.3.3.8. Cloning database objects

Tables, views, stored procedures and functions can be cloned with the appropriate **CLONE** command from its context menu: **CLONE TABLE**, **CLONE VIEW**, **CLONE ROUTINE**. The clone commands open the corresponding editor for a new object: the **TABLE EDITOR** for cloning a table and the SQL Editor for cloning a view or a routine.

To save the cloned object, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

24.3.4. Visual Studio Plugin Support

If you have a comment, or if you discover a bug, please, use our MySQL bug tracking system (<http://bugs.mysql.com>) to report problem or add your suggestion.

24.3.4.1. Visual Studio Plugin FAQ

Questions

- **25.3.4.1.1:** When creating a connection, typing the connection details causes the connection window to immediately close.

Questions and Answers

25.3.4.1.1: When creating a connection, typing the connection details causes the connection window to immediately close.

There are known issues with versions of Connector/NET earlier than 5.0.2. Connector/NET 1.0.x is known not to work. If you have any of these versions installed, or have previously upgraded from an earlier version, uninstall Connector/NET completely and then install Connector/NET 5.0.2.

24.4. MySQL Connector/J

MySQL provides connectivity for client applications developed in the Java programming language via a JDBC driver, which is called MySQL Connector/J.

MySQL Connector/J is a JDBC-3.0 Type 4 driver, which means that is pure Java, implements version 3.0 of the JDBC specification, and communicates directly with the MySQL server using the MySQL protocol.

Although JDBC is useful by itself, we would hope that if you are not familiar with JDBC that after reading the first few sections of this manual, that you would avoid using naked JDBC for all but the most trivial problems and consider using one of the popular persistence frameworks such as [Hibernate](#), [Spring's JDBC templates](#) or [Ibatis SQL Maps](#) to do the majority of repetitive work and heavier lifting that is sometimes required with JDBC.

This section is not designed to be a complete JDBC tutorial. If you need more information about using JDBC you might be interested in the following online tutorials that are more in-depth than the information presented here:

- [JDBC Basics](#) — A tutorial from Sun covering beginner topics in JDBC
- [JDBC Short Course](#) — A more in-depth tutorial from Sun and JGuru

Key topics:

- For help with connection strings, connection options setting up your connection through JDBC, see [Section 24.4.4.1, “Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J”](#).
- For tips on using Connector/J and JDBC with generic J2EE toolkits, see [Section 24.4.5.2, “Using Connector/J with J2EE and Other Java Frameworks”](#).
- Developers using the Tomcat server platform, see [Section 24.4.5.2.2, “Using Connector/J with Tomcat”](#).
- Developers using JBoss, see [Section 24.4.5.2.3, “Using Connector/J with JBoss”](#).
- Developers using Spring, see [Section 24.4.5.2.4, “Using Connector/J with Spring”](#).

MySQL Enterprise

MySQL Enterprise subscribers will find more information about using JDBC with MySQL in the Knowledge Base articles about [JDBC](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

24.4.1. Connector/J Versions

There are currently four versions of MySQL Connector/J available:

- Connector/J 5.1 is the Type IV pure-java JDBC driver and provides compatibility with all the functionality of MySQL, including 4.1, 5.0, 5.1 and the 6.0 alpha release featuring the new Falcon storage engine. Connector/J 5.1 provides ease of development features, including auto-registration with the Driver Manager, standardized validity checks, categorized SQLExceptions, support for the JDBC-4.0 XML processing, per connection client information, [NCHAR](#), [NVARCHAR](#) and [NCLLOB](#) types. This release also includes all bug fixes up to and including Connector/J 5.0.6.
- Connector/J 5.0 provides support for all the functionality offered by Connector/J 3.1 and includes distributed transaction (XA) support.
- Connector/J 3.1 was designed for connectivity to MySQL 4.1 and MySQL 5.0 servers and provides support for all the functionality in MySQL 5.0 except distributed transaction (XA) support.
- Connector/J 3.0 provides core functionality and was designed with connectivity to MySQL 3.x or MySQL 4.1 servers, although it will provide basic compatibility with later versions of MySQL. Connector/J 3.0 does not support server-side prepared statements, and does not support any of the features in versions of MySQL later than 4.1.

The current recommended version for Connector/J is 5.1. This guide covers all three connector versions, with specific notes given where a setting applies to a specific option.

24.4.1.1. Java Versions Supported

MySQL Connector/J supports Java-2 JVMs, including:

- JDK 1.2.x (only for Connector/J 3.1.x or earlier)
- JDK 1.3.x
- JDK 1.4.x
- JDK 1.5.x

If you are building Connector/J from source using the source distribution (see [Section 24.4.2.4, “Installing from the Development Source Tree”](#)) then you must use JDK 1.4.x or newer to compile the Connector package.

MySQL Connector/J does not support JDK-1.1.x or JDK-1.0.x.

Because of the implementation of `java.sql.Savepoint`, Connector/J 3.1.0 and newer will not run on JDKs older than 1.4 unless the class verifier is turned off (by setting the `-Xverify:none` option to the Java runtime). This is because the class verifier will try to load the class definition for `java.sql.Savepoint` even though it is not accessed by the driver unless you actually use savepoint functionality.

Caching functionality provided by Connector/J 3.1.0 or newer is also not available on JVMs older than 1.4.x, as it relies on `java.util.LinkedHashMap` which was first available in JDK-1.4.0.

24.4.2. Connector/J Installation

You can install the Connector/J package using two methods, using either the binary or source distribution. The binary distribution provides the easiest methods for installation; the source distribution enables you to customize your installation further. With either solution, you must manually add the Connector/J location to your Java `CLASSPATH`.

24.4.2.1. Installing Connector/J from a Binary Distribution

The easiest method of installation is to use the binary distribution of the Connector/J package. The binary distribution is available either as a Tar/Gzip or Zip file which you must extract to a suitable location and then optionally make the information about the package available by changing your `CLASSPATH` (see [Section 24.4.2.2, “Installing the Driver and Configuring the CLASSPATH”](#)).

MySQL Connector/J is distributed as a .zip or .tar.gz archive containing the sources, the class files, and the JAR archive named `mysql-connector-java-[version]-bin.jar`, and starting with Connector/J 3.1.8 a debug build of the driver in a file named `mysql-connector-java-[version]-bin-g.jar`.

Starting with Connector/J 3.1.9, the `.class` files that constitute the JAR files are only included as part of the driver JAR file.

You should not use the debug build of the driver unless instructed to do so when reporting a problem or a bug to MySQL AB, as it is not designed to be run in production environments, and will have adverse performance impact when used. The debug binary also depends on the Aspect/J runtime library, which is located in the `src/lib/aspectjrt.jar` file that comes with the Connector/J distribution.

You will need to use the appropriate graphical or command-line utility to extract the distribution (for example, WinZip for the .zip archive, and `tar` for the .tar.gz archive). Because there are potentially long filenames in the distribution, we use the GNU tar archive format. You will need to use GNU tar (or an application that understands the GNU tar archive format) to unpack the .tar.gz variant of the distribution.

24.4.2.2. Installing the Driver and Configuring the CLASSPATH

Once you have extracted the distribution archive, you can install the driver by placing `mysql-connector-java-[version]-bin.jar` in your classpath, either by adding the full path to it to your `CLASSPATH` environment variable, or by directly specifying it with the command line switch `-cp` when starting your JVM.

If you are going to use the driver with the JDBC DriverManager, you would use `com.mysql.jdbc.Driver` as the class that implements `java.sql.Driver`.

You can set the `CLASSPATH` environment variable under UNIX, Linux or Mac OS X either locally for a user within their `.profile`, `.login` or other login file. You can also set it globally by editing the global `/etc/profile` file.

For example, under a C shell (csh, tcsh) you would add the Connector/J driver to your `CLASSPATH` using the following:

```
shell> setenv CLASSPATH /path/mysql-connector-java-[ver]-bin.jar:$CLASSPATH
```

Or with a Bourne-compatible shell (sh, ksh, bash):

```
export set CLASSPATH=/path/mysql-connector-java-[ver]-bin.jar:$CLASSPATH
```

Within Windows 2000, Windows XP and Windows Server 2003, you must set the environment variable through the System control panel.

If you want to use MySQL Connector/J with an application server such as Tomcat or JBoss, you will have to read your vendor's documentation for more information on how to configure third-party class libraries, as most application servers ignore the `CLASSPATH` environment variable. For configuration examples for some J2EE application servers, see [Section 24.4.5.2, "Using Connector/J with J2EE and Other Java Frameworks"](#). However, the authoritative source for JDBC connection pool configuration information for your particular application server is the documentation for that application server.

If you are developing servlets or JSPs, and your application server is J2EE-compliant, you can put the driver's `.jar` file in the `WEB-INF/lib` subdirectory of your webapp, as this is a standard location for third party class libraries in J2EE web applications.

You can also use the `MysqlDataSource` or `MysqlConnectionPoolDataSource` classes in the `com.mysql.jdbc.jdbc2.optional` package, if your J2EE application server supports or requires them. Starting with Connector/J 5.0.0, the `javax.sql.XADataSource` interface is implemented via the `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` class, which supports XA distributed transactions when used in combination with MySQL server version 5.0.

The various `MysqlDataSource` classes support the following parameters (through standard set mutators):

- user
- password
- serverName (see the previous section about fail-over hosts)
- databaseName
- port

24.4.2.3. Upgrading from an Older Version

MySQL AB tries to keep the upgrade process as easy as possible, however as is the case with any software, sometimes changes need to be made in new versions to support new features, improve existing functionality, or comply with new standards.

This section has information about what users who are upgrading from one version of Connector/J to another (or to a new version of the MySQL server, with respect to JDBC functionality) should be aware of.

24.4.2.3.1. Upgrading from MySQL Connector/J 3.0 to 3.1

Connector/J 3.1 is designed to be backward-compatible with Connector/J 3.0 as much as possible. Major changes are isolated to new functionality exposed in MySQL-4.1 and newer, which includes Unicode character sets, server-side prepared statements, SQL-State codes returned in error messages by the server and various performance enhancements that can be enabled or disabled via configuration properties.

- **Unicode Character Sets** — See the next section, as well as [Chapter 9, Character Set Support](#), for information on this new feature of MySQL. If you have something misconfigured, it will usually show up as an error with a message similar to `Illegal mix of collations`.
- **Server-side Prepared Statements** — Connector/J 3.1 will automatically detect and use server-side prepared statements when they are available (MySQL server version 4.1.0 and newer).

Starting with version 3.1.7, the driver scans SQL you are preparing via all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this feature by passing `emulateUnsupportedPstmts=false` in your JDBC URL.

If your application encounters issues with server-side prepared statements, you can revert to the older client-side emulated prepared statement code that is still presently used for MySQL servers older than 4.1.0 with the connection property `useServer-`

PrepStmts=false

- **Datetimes** with all-zero components (0000-00-00 . . .) — These values can not be represented reliably in Java. Connector/J 3.0.x always converted them to NULL when being read from a ResultSet.

Connector/J 3.1 throws an exception by default when these values are encountered as this is the most correct behavior according to the JDBC and SQL standards. This behavior can be modified using the `zeroDateTimeBehavior` configuration property. The allowable values are:

- `exception` (the default), which throws an `SQLException` with an `SQLState` of `S1009`.
- `convertToNull`, which returns `NULL` instead of the date.
- `round`, which rounds the date to the nearest closest value which is `0001-01-01`.

Starting with Connector/J 3.1.7, `ResultSet.getString()` can be decoupled from this behavior via `noDatetimeStringSync=true` (the default value is `false`) so that you can get retrieve the unaltered all-zero value as a `String`. It should be noted that this also precludes using any time zone conversions, therefore the driver will not allow you to enable `noDatetimeStringSync` and `useTimezone` at the same time.

- **New SQLState Codes** — Connector/J 3.1 uses SQL:1999 SQLState codes returned by the MySQL server (if supported), which are different from the legacy X/Open state codes that Connector/J 3.0 uses. If connected to a MySQL server older than MySQL-4.1.0 (the oldest version to return SQLStates as part of the error code), the driver will use a built-in mapping. You can revert to the old mapping by using the configuration property `useSqlStateCodes=false`.
- **ResultSet.getString()** — Calling `ResultSet.getString()` on a BLOB column will now return the address of the `byte[]` array that represents it, instead of a `String` representation of the BLOB. BLOBs have no character set, so they can't be converted to `java.lang.Strings` without data loss or corruption.

To store strings in MySQL with LOB behavior, use one of the TEXT types, which the driver will treat as a `java.sql.Clob`.

- **Debug builds** — Starting with Connector/J 3.1.8 a debug build of the driver in a file named `mysql-connector-java-[version]-bin-g.jar` is shipped alongside the normal binary jar file that is named `mysql-connector-java-[version]-bin.jar`.

Starting with Connector/J 3.1.9, we don't ship the `.class` files unbundled, they are only available in the JAR archives that ship with the driver.

You should not use the debug build of the driver unless instructed to do so when reporting a problem or bug to MySQL AB, as it is not designed to be run in production environments, and will have adverse performance impact when used. The debug binary also depends on the Aspect/J runtime library, which is located in the `src/lib/aspectjrt.jar` file that comes with the Connector/J distribution.

24.4.2.3.2. JDBC-Specific Issues When Upgrading to MySQL Server 4.1 or Newer

- *Using the UTF-8 Character Encoding* - Prior to MySQL server version 4.1, the UTF-8 character encoding was not supported by the server, however the JDBC driver could use it, allowing storage of multiple character sets in latin1 tables on the server.

Starting with MySQL-4.1, this functionality is deprecated. If you have applications that rely on this functionality, and can not upgrade them to use the official Unicode character support in MySQL server version 4.1 or newer, you should add the following property to your connection URL:

```
useOldUTF8Behavior=true
```

- *Server-side Prepared Statements* - Connector/J 3.1 will automatically detect and use server-side prepared statements when they are available (MySQL server version 4.1.0 and newer). If your application encounters issues with server-side prepared statements, you can revert to the older client-side emulated prepared statement code that is still presently used for MySQL servers older than 4.1.0 with the following connection property:

```
useServerPrepStmts=false
```

24.4.2.4. Installing from the Development Source Tree

Caution

You should read this section only if you are interested in helping us test our new code. If you just want to get MySQL Connector/J up and running on your system, you should use a standard release distribution.

To install MySQL Connector/J from the development source tree, make sure that you have the following prerequisites:

- Subversion, to check out the sources from our repository (available from <http://subversion.tigris.org/>).
- Apache Ant version 1.6 or newer (available from <http://ant.apache.org/>).
- JDK-1.4.2 or later. Although MySQL Connector/J can be installed on older JDKs, to compile it from source you must have at least JDK-1.4.2.

The Subversion source code repository for MySQL Connector/J is located at <http://svn.mysql.com/svnpublic/connector-j>. In general, you should not check out the entire repository because it contains every branch and tag for MySQL Connector/J and is quite large.

To check out and compile a specific branch of MySQL Connector/J, follow these steps:

1. At the time of this writing, there are three active branches of Connector/J: `branch_3_0`, `branch_3_1` and `branch_5_0`. Check out the latest code from the branch that you want with the following command (replacing `[major]` and `[minor]` with appropriate version numbers):

```
shell> svn co »
http://svn.mysql.com/svnpublic/connector-j/branches/branch_[major]_[minor]/connector-j
```

This creates a `connector-j` subdirectory in the current directory that contains the latest sources for the requested branch.

2. Change location to the `connector-j` directory to make it your current working directory:

```
shell> cd connector-j
```

3. Issue the following command to compile the driver and create a `.jar` file suitable for installation:

```
shell> ant dist
```

This creates a `build` directory in the current directory, where all build output will go. A directory is created in the `build` directory that includes the version number of the sources you are building from. This directory contains the sources, compiled `.class` files, and a `.jar` file suitable for deployment. For other possible targets, including ones that will create a fully packaged distribution, issue the following command:

```
shell> ant --projecthelp
```

4. A newly created `.jar` file containing the JDBC driver will be placed in the directory `build/mysql-connector-java-[version]`.

Install the newly created JDBC driver as you would a binary `.jar` file that you download from MySQL by following the instructions in [Section 24.4.2.2, “Installing the Driver and Configuring the CLASSPATH”](#).

24.4.3. Connector/J Examples

Examples of using Connector/J are located throughout this document, this section provides a summary and links to these examples.

- [Example 24.1, “Obtaining a connection from the DriverManager”](#)
- [Example 24.2, “Using java.sql.Statement to execute a SELECT query”](#)
- [Example 24.3, “Stored Procedures”](#)
- [Example 24.4, “Using Connection.prepareStatement\(\)”](#)
- [Example 24.5, “Registering output parameters”](#)
- [Example 24.6, “Setting CallableStatement input parameters”](#)
- [Example 24.7, “Retrieving results and output parameter values”](#)
- [Example 24.8, “Retrieving AUTO_INCREMENT column values using Statement.getGeneratedKeys\(\)”](#)

- Example 24.9, “Retrieving `AUTO_INCREMENT` column values using `SELECT LAST_INSERT_ID()`”
- Example 24.10, “Retrieving `AUTO_INCREMENT` column values in `Updatable ResultSets`”
- Example 24.11, “Using a connection pool with a J2EE application server”
- Example 24.12, “Example of transaction with retry logic”

24.4.4. Connector/J (JDBC) Reference

This section of the manual contains reference material for MySQL Connector/J, some of which is automatically generated during the Connector/J build process.

24.4.4.1. Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J

The name of the class that implements `java.sql.Driver` in MySQL Connector/J is `com.mysql.jdbc.Driver`. The `org.gjt.mm.mysql.Driver` class name is also usable to remain backward-compatible with MM.MySQL. You should use this class name when registering the driver, or when otherwise configuring software to use MySQL Connector/J.

The JDBC URL format for MySQL Connector/J is as follows, with items in square brackets ([,]) being optional:

```
jdbc:mysql://[host][, failoverhost...][:port]/[database] »
[?propertyName1]=propertyValue1[&propertyName2]=propertyValue2]...
```

If the hostname is not specified, it defaults to 127.0.0.1. If the port is not specified, it defaults to 3306, the default port number for MySQL servers.

```
jdbc:mysql://[host:port],[host:port].../[database] »
[?propertyName1]=propertyValue1[&propertyName2]=propertyValue2]...
```

If the database is not specified, the connection will be made with no default database. In this case, you will need to either call the `setCatalog()` method on the `Connection` instance or fully-specify table names using the database name (i.e. `SELECT dbname.tablename.colname FROM dbname.tablename...`) in your SQL. Not specifying the database to use upon connection is generally only useful when building tools that work with multiple databases, such as GUI database managers.

MySQL Connector/J has fail-over support. This allows the driver to fail-over to any number of slave hosts and still perform read-only queries. Fail-over only happens when the connection is in an `autoCommit(true)` state, because fail-over can not happen reliably when a transaction is in progress. Most application servers and connection pools set `autoCommit` to `true` at the end of every transaction/connection use.

The fail-over functionality has the following behavior:

- If the URL property `autoReconnect` is `false`: Failover only happens at connection initialization, and fallback occurs when the driver determines that the first host has become available again.
- If the URL property `autoReconnect` is `true`: Failover happens when the driver determines that the connection has failed (before every query), and falls back to the first host when it determines that the host has become available again (after `queriesBeforeRetryMaster` queries have been issued).

In either case, whenever you are connected to a "failed-over" server, the connection will be set to read-only state, so queries that would modify data will have exceptions thrown (the query will **never** be processed by the MySQL server).

Configuration properties define how Connector/J will make a connection to a MySQL server. Unless otherwise noted, properties can be set for a `DataSource` object or for a `Connection` object.

Configuration Properties can be set in one of the following ways:

- Using the `set*()` methods on MySQL implementations of `java.sql.DataSource` (which is the preferred method when using implementations of `java.sql.DataSource`):
 - `com.mysql.jdbc.jdbc2.optional.MysqlDataSource`
 - `com.mysql.jdbc.jdbc2.optional.MysqlConnectionPoolDataSource`
- As a key/value pair in the `java.util.Properties` instance passed to `DriverManager.getConnection()` or

```
Driver.connect()
```

- As a JDBC URL parameter in the URL given to `java.sql.DriverManager.getConnection()`, `java.sql.Driver.connect()` or the MySQL implementations of the `javax.sql.DataSource.setURL()` method.

Note

If the mechanism you use to configure a JDBC URL is XML-based, you will need to use the XML character literal `&` to separate configuration parameters, as the ampersand is a reserved character for XML.

The properties are listed in the following tables.

Connection/Authentication.

Property Name	Definition	Default Value	Since Version
user	The user to connect as		all versions
password	The password to use when connecting		all versions
socketFactory	The name of the class that the driver should use for creating socket connections to the server. This class must implement the interface 'com.mysql.jdbc.SocketFactory' and have public no-args constructor.	com.mysql.jdbc.StandardSocketFactory	3.0.3
connectTimeout	Timeout for socket connect (in milliseconds), with 0 being no timeout. Only works on JDK-1.4 or newer. Defaults to '0'.	0	3.0.1
socketTimeout	Timeout on network socket operations (0, the default means no timeout).	0	3.0.1
connectionLifecycleInterceptors	A comma-delimited list of classes that implement "com.mysql.jdbc.ConnectionLifecycleInterceptor" that should notified of connection lifecycle events (creation, destruction, commit, rollback, setCatalog and setAutoCommit) and potentially alter the execution of these commands. ConnectionLifecycleInterceptors are "stackable", more than one interceptor may be specified via the configuration property as a comma-delimited list, with the interceptors executed in order from left to right.		5.1.4
useConfigs	Load the comma-delimited list of configuration properties before parsing the URL or applying user-specified properties. These configurations are explained in the 'Configurations' of the documentation.		3.1.5
interactiveClient	Set the CLIENT_INTERACTIVE flag, which tells MySQL to timeout connections based on INTERACTIVE_TIMEOUT instead of WAIT_TIMEOUT	false	3.1.0
localSocketAddress	Hostname or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.		5.0.5
propertiesTransform	An implementation of com.mysql.jdbc.ConnectionPropertiesTransform that the driver will use to modify URL properties passed to the driver before attempting a connection		3.1.4
useCompression	Use zlib compression when communicating with the server (true/false)? Defaults to 'false'.	false	3.0.17

Networking.

Property Name	Definition	Default Value	Since Version
tcpKeepAlive	If connecting using TCP/IP, should the driver set SO_KEEPALIVE?	true	5.0.7
tcpNoDelay	If connecting using TCP/IP, should the driver set SO_TCP_NODELAY (disabling the Nagle Algorithm)?	true	5.0.7

tcpRcvBuf	If connecting using TCP/IP, should the driver set SO_RCV_BUF to the given value? The default value of '0', means use the platform default value for this property)	0	5.0.7
tcpSndBuf	If connecting using TCP/IP, should the driver set SO_SND_BUF to the given value? The default value of '0', means use the platform default value for this property)	0	5.0.7
tcpTrafficClass	If connecting using TCP/IP, should the driver set traffic class or type-of-service fields ?See the documentation for java.net.Socket.setTrafficClass() for more information.	0	5.0.7

High Availability and Clustering.

Property Name	Definition	Default Value	Since Version
autoReconnect	Should the driver try to re-establish stale and/or dead connections? If enabled the driver will throw an exception for a queries issued on a stale or dead connection, which belong to the current transaction, but will attempt reconnect before the next query is issued on the connection in a new transaction. The use of this feature is not recommended, because it has side effects related to session state and data consistency when applications don't handle SQLExceptions properly, and is only designed to be used when you are unable to configure your application to handle SQLExceptions resulting from dead and stale connections properly. Alternatively, investigate setting the MySQL server variable "wait_timeout" to some high value rather than the default of 8 hours.	false	1.1
autoReconnectForPools	Use a reconnection strategy appropriate for connection pools (defaults to 'false')	false	3.1.3
failOverReadOnly	When failing over in autoReconnect mode, should the connection be set to 'read-only'?	true	3.0.12
maxReconnects	Maximum number of reconnects to attempt if autoReconnect is true, default is '3'.	3	1.1
reconnectAtTxEnd	If autoReconnect is set to true, should the driver attempt reconnects at the end of every transaction?	false	3.0.10
initialTimeout	If autoReconnect is enabled, the initial time to wait between reconnect attempts (in seconds, defaults to '2').	2	1.1
roundRobinLoadBalance	When autoReconnect is enabled, and failoverReadOnly is false, should we pick hosts to connect to on a round-robin basis?	false	3.1.2
queriesBeforeRetryMaster	Number of queries to issue before falling back to master when failed over (when using multi-host failover). Whichever condition is met first, 'queriesBeforeRetryMaster' or 'secondsBeforeRetryMaster' will cause an attempt to be made to reconnect to the master. Defaults to 50.	50	3.0.2
secondsBeforeRetryMaster	How long should the driver wait, when failed over, before attempting	30	3.0.2
resourceId	A globally unique name that identifies the resource that this datasource or connection is connected to, used for XAResource.isSameRM() when the driver can't determine this value based on hostnames used in the URL		5.0.1

Security.

Property Name	Definition	Default Value	Since Version
allowMultiQueries	Allow the use of ';' to delimit multiple queries during one statement (true/false), defaults to 'false'	false	3.1.1
useSSL	Use SSL when communicating with the server (true/false), defaults to 'false'	false	3.0.2
requireSSL	Require SSL connection if useSSL=true? (defaults to 'false').	false	3.1.0

allowLoadLocalInfile	Should the driver allow use of 'LOAD DATA LOCAL INFILE...' (defaults to 'true').	true	3.0.3
allowUrlInLocalInfile	Should the driver allow URLs in 'LOAD DATA LOCAL INFILE' statements?	false	3.1.4
clientCertificateKeyStorePassword	Password for the client certificates KeyStore		5.1.0
clientCertificateKeyStoreType	KeyStore type for client certificates (NULL or empty means use default, standard keystore types supported by the JVM are "JKS" and "PKCS12", your environment may have more available depending on what security products are installed and available to the JVM.		5.1.0
clientCertificateKeyStoreUrl	URL to the client certificate KeyStore (if not specified, use defaults)		5.1.0
trustCertificateKeyStorePassword	Password for the trusted root certificates KeyStore		5.1.0
trustCertificateKeyStoreType	KeyStore type for trusted root certificates (NULL or empty means use default, standard keystore types supported by the JVM are "JKS" and "PKCS12", your environment may have more available depending on what security products are installed and available to the JVM.		5.1.0
trustCertificateKeyStoreUrl	URL to the trusted root certificate KeyStore (if not specified, use defaults)		5.1.0
paranoid	Take measures to prevent exposure sensitive information in error messages and clear data structures holding sensitive data when possible? (defaults to 'false')	false	3.0.1

Performance Extensions.

Property Name	Definition	Default Value	Since Version
callableStmtCacheSize	If 'cacheCallableStmts' is enabled, how many callable statements should be cached?	100	3.1.2
metadataCacheSize	The number of queries to cache ResultSetMetadata for if cacheResultSetMetaData is set to 'true' (default 50)	50	3.1.1
prepStmtCacheSize	If prepared statement caching is enabled, how many prepared statements should be cached?	25	3.0.10
prepStmtCacheSqlLimit	If prepared statement caching is enabled, what's the largest SQL the driver will cache the parsing for?	256	3.0.10
alwaysSendSetIsolation	Should the driver always communicate with the database when Connection.setTransactionIsolation() is called? If set to false, the driver will only communicate with the database when the requested transaction isolation is different than the whichever is newer, the last value that was set via Connection.setTransactionIsolation(), or the value that was read from the server when the connection was established.	true	3.1.7
maintainTimeStats	Should the driver maintain various internal timers to enable idle time calculations as well as more verbose error messages when the connection to the server fails? Setting this property to false removes at least two calls to System.getCurrentTimeMillis() per query.	true	3.1.9
useCursorFetch	If connected to MySQL > 5.0.2, and setFetchSize() > 0 on a statement, should that statement use cursor-based fetching to retrieve rows?	false	5.0.0
blobSendChunkSize	Chunk to use when sending BLOB/CLOBs via ServerPreparedStatements	1048576	3.1.9
cacheCallableStmts	Should the driver cache the parsing stage of CallableStatements	false	3.1.2
cachePrepStmts	Should the driver cache the parsing stage of PreparedStatements of client-side prepared statements, the "check" for suitability of server-side prepared and server-side prepared statements themselves?	false	3.0.10
cacheResultSetMetadata	Should the driver cache ResultSetMetadata for Statements and PreparedStatements? (Req. JDK-1.4+, true/false, default 'false')	false	3.1.1

cacheServerConfiguration	Should the driver cache the results of 'SHOW VARIABLES' and 'SHOW COLLATION' on a per-URL basis?	false	3.1.5
defaultFetchSize	The driver will call setFetchSize(n) with this value on all newly-created Statements	0	3.1.9
dontTrackOpenResources	The JDBC specification requires the driver to automatically track and close resources, however if your application doesn't do a good job of explicitly calling close() on statements or result sets, this can cause memory leakage. Setting this property to true relaxes this constraint, and can be more memory efficient for some applications.	false	3.1.7
dynamicCalendars	Should the driver retrieve the default calendar when required, or cache it per connection/session?	false	3.1.5
elideSetAutoCommits	If using MySQL-4.1 or newer, should the driver only issue 'set autocommit=n' queries when the server's state doesn't match the requested state by Connection.setAutoCommit(boolean)?	false	3.1.3
enableQueryTimeouts	When enabled, query timeouts set via Statement.setQueryTimeout() use a shared java.util.Timer instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the TimerTask for the given timeout which won't be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality.	true	5.0.6
holdResultsOpenOverStatementClose	Should the driver close result sets on Statement.close() as required by the JDBC specification?	false	3.1.7
largeRowSizeThreshold	What size result set row should the JDBC driver consider "large", and thus use a more memory-efficient way of representing the row internally?	2048	5.1.1
loadBalanceStrategy	If using a load-balanced connection to connect to SQL nodes in a MySQL Cluster/NDB configuration (by using the URL prefix "jdbc:mysql:loadbalance://"), which load balancing algorithm should the driver use: (1) "random" - the driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload. (2) "bestResponseTime" - the driver will route the request to the host that had the best response time for the previous transaction.	random	5.0.6
locatorFetchBufferSize	If 'emulateLocators' is configured to 'true', what size buffer should be used when fetching BLOB data for getBinaryInputStream?	1048576	3.2.1
rewriteBatchedStatements	Should the driver use multiqueries (irregardless of the setting of "allowMultiQueries") as well as rewriting of prepared statements for INSERT into multi-value inserts when executeBatch() is called? Notice that this has the potential for SQL injection if using plain java.sql.Statements and your code doesn't sanitize input correctly. Notice that for prepared statements, server-side prepared statements can not currently take advantage of this rewrite option, and that if you don't specify stream lengths when using PreparedStatement.set*Stream(), the driver won't be able to determine the optimum number of parameters per batch and you might receive an error from the driver that the resultant packet is too large. Statement.getGeneratedKeys() for these rewritten statements only works when the entire batch includes INSERT statements.	false	3.1.13
useDirectRowUnpack	Use newer result set row unpacking code that skips a copy from network buffers to a MySQL packet instance and instead reads directly into the result set row data buffers.	true	5.1.1
useDynamicCharsetInfo	Should the driver use a per-connection cache of character set information queried from the server when necessary, or use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver?	true	5.0.6

useFastDateParsing	Use internal String->Date/Time/Timestamp conversion routines to avoid excessive object creation?	true	5.0.5
useFastIntParsing	Use internal String->Integer conversion routines to avoid excessive object creation?	true	3.1.4
useJvmCharsetConverters	Always use the character encoding routines built into the JVM, rather than using lookup tables for single-byte character sets?	false	5.0.1
useLocalSessionState	Should the driver refer to the internal values of autocommit and transaction isolation that are set by Connection.setAutoCommit() and Connection.setTransactionIsolation() and transaction state as maintained by the protocol, rather than querying the database or blindly sending commands to the database for commit() or rollback() method calls?	false	3.1.7
useReadAheadInput	Use newer, optimized non-blocking, buffered input stream when reading from the server?	true	3.1.5

Debugging/Profiling.

Property Name	Definition	Default Value	Since Version
logger	The name of a class that implements "com.mysql.jdbc.log.Log" that will be used to log messages to. (default is "com.mysql.jdbc.log.StandardLogger", which logs to STDERR)	com.mysql.jdbc.log.StandardLogger	3.1.1
gatherPerfMetrics	Should the driver gather performance metrics, and report them via the configured logger every 'reportMetricsIntervalMillis' milliseconds?	false	3.1.2
profileSQL	Trace queries and their execution/fetch times to the configured logger (true/false) defaults to 'false'	false	3.1.0
profileSql	Deprecated, use 'profileSQL' instead. Trace queries and their execution/fetch times on STDERR (true/false) defaults to 'false'		2.0.14
reportMetricsIntervalMillis	If 'gatherPerfMetrics' is enabled, how often should they be logged (in ms)?	30000	3.1.2
maxQuerySizeToLog	Controls the maximum length/size of a query that will get logged when profiling or tracing	2048	3.1.3
packetDebugBufferSize	The maximum number of packets to retain when 'enablePacketDebug' is true	20	3.1.3
slowQueryThresholdMillis	If 'logSlowQueries' is enabled, how long should a query (in ms) before it is logged as 'slow'?	2000	3.1.2
slowQueryThresholdNanos	If 'useNanosForElapsedTime' is set to true, and this property is set to a non-zero value, the driver will use this threshold (in nanosecond units) to determine if a query was slow.	0	5.0.7
useUsageAdvisor	Should the driver issue 'usage' warnings advising proper and efficient usage of JDBC and MySQL Connector/J to the log (true/false, defaults to 'false')?	false	3.1.1
autoGenerateTestcaseScript	Should the driver dump the SQL it is executing, including server-side prepared statements to STDERR?	false	3.1.9
autoSlowLog	Instead of using slowQueryThreshold* to determine if a query is slow enough to be logged, maintain statistics that allow the driver to determine queries that are outside the 99th percentile?	true	5.1.4
clientInfoProvider	The name of a class that implements the com.mysql.jdbc.JDBC4ClientInfoProvider interface in order to support JDBC-4.0's Connection.get/setClientInfo() methods	com.mysql.jdbc.JDBC4ClientInfoProvider	5.1.0
dumpMetadataOnColumnNotFound	Should the driver dump the field-level metadata of a result set into the exception message when ResultSet.findColumn() fails?	false	3.1.13
dumpQueriesOnException	Should the driver dump the contents of the query sent to the server in the message for SQLExceptions?	false	3.1.3

enablePacketDebug	When enabled, a ring-buffer of 'packetDebugBufferSize' packets will be kept, and dumped when exceptions are thrown in key areas in the driver's code	false	3.1.3
explainSlowQueries	If 'logSlowQueries' is enabled, should the driver automatically issue an 'EXPLAIN' on the server and send the results to the configured log at a WARN level?	false	3.1.2
includeInnoDBStatusInDeadlockExceptions	Include the output of "SHOW ENGINE INNODB STATUS" in exception messages when deadlock exceptions are detected?	false	5.0.7
logSlowQueries	Should queries that take longer than 'slowQueryThresholdMillis' be logged?	false	3.1.2
logXACommands	Should the driver log XA commands sent by MySQLXAConnection to the server, at the DEBUG level of logging?	false	5.0.5
resultSetSizeThreshold	If the usage advisor is enabled, how many rows should a result set contain before the driver warns that it is suspiciously large?	100	5.0.5
traceProtocol	Should trace-level network protocol be logged?	false	3.1.2
useNanosForElapsedTime	For profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (JDK >= 1.5)?	false	5.0.7

Miscellaneous.

Property Name	Definition	Default Value	Since Version
useUnicode	Should the driver use Unicode character encodings when handling strings? Should only be used when the driver can't determine the character set mapping, or you are trying to 'force' the driver to use a character set that MySQL either doesn't natively support (such as UTF-8), true/false, defaults to 'true'	true	1.1g
characterEncoding	If 'useUnicode' is set to true, what character encoding should the driver use when dealing with strings? (defaults is to 'autodetect')		1.1g
characterSetResults	Character set to tell the server to return results as.		3.0.13
connectionCollation	If set, tells the server to use this collation via 'set collation_connection'		3.0.13
useBlobToStoreUTF8OutsideBMP	Tells the driver to treat [MEDIUM/LONG]BLOB columns as [LONG]VARCHAR columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server can't handle natively.	false	5.1.3
utf8OutsideBmpExcludedColumnNamePattern	When "useBlobToStoreUTF8OutsideBMP" is set to "true", column names matching the given regex will still be treated as BLOBs unless they match the regex specified for "utf8OutsideBmpIncludedColumnNamePattern". The regex must follow the patterns used for the java.util.regex package.		5.1.3
utf8OutsideBmpIncludedColumnNamePattern	Used to specify exclusion rules to "utf8OutsideBmpExcludedColumnNamePattern". The regex must follow the patterns used for the java.util.regex package.		5.1.3
sessionVariables	A comma-separated list of name/value pairs to be sent as SET SESSION ... to the server when the driver connects.		3.1.8
allowNaNAndInf	Should the driver allow NaN or +/- INF values in PreparedStatement.setDouble()?	false	3.1.5
autoClosePstmtStreams	Should the driver automatically call .close() on streams/readers passed as arguments via set*() methods?	false	3.1.12
autoDeserialize	Should the driver automatically detect and de-serialize objects stored in BLOB fields?	false	3.1.5
blobsAreStrings	Should the driver always treat BLOBs as Strings - specifically to work around dubious metadata returned by the server for GROUP BY clauses?	false	5.0.8
capitalizeTypeNames	Capitalize type names in DatabaseMetaData? (usually only useful when using WebObjects, true/false, defaults to 'false')	true	2.0.7
clobCharacterEncoding	The character encoding to use for sending and retrieving TEXT,		5.0.0

	MEDIUMTEXT and LONGTEXT values instead of the configured connection characterEncoding		
clobberStreamingResults	This will cause a 'streaming' ResultSet to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server.	false	3.0.9
continueBatchOnError	Should the driver continue processing batch commands if one statement fails. The JDBC spec allows either way (defaults to 'true').	true	3.0.3
createDatabaseIfNotExist	Creates the database given in the URL if it doesn't yet exist. Assumes the configured user has permissions to create databases.	false	3.1.9
emptyStringsConvertToZero	Should the driver allow conversions from empty string fields to numeric values of '0'?	true	3.1.8
emulateLocators	Should the driver emulate java.sql.Blobs with locators? With this feature enabled, the driver will delay loading the actual Blob data until the one of the retrieval methods (getInputStream(), getBytes(), and so forth) on the blob data stream has been accessed. For this to work, you must use a column alias with the value of the column to the actual name of the Blob. The feature also has the following restrictions: The SELECT that created the result set must reference only one table, the table must have a primary key; the SELECT must alias the original blob column name, specified as a string, to an alternate name; the SELECT must cover all columns that make up the primary key.	false	3.1.0
emulateUnsupportedPstmts	Should the driver detect prepared statements that are not supported by the server, and replace them with client-side emulated versions?	true	3.1.7
functionsNeverReturnBlobs	Should the driver always treat data from functions returning BLOBs as Strings - specifically to work around dubious metadata returned by the server for GROUP BY clauses?	false	5.0.8
generateSimpleParameterMetadata	Should the driver generate simplified parameter metadata for PreparedStatements when no metadata is available either because the server couldn't support preparing the statement, or server-side prepared statements are disabled?	false	5.0.5
ignoreNonTxTables	Ignore non-transactional table warning for rollback? (defaults to 'false').	false	3.0.9
jdbcCompliantTruncation	Should the driver throw java.sql.DataTruncation exceptions when data is truncated as is required by the JDBC specification when connected to a server that supports warnings (MySQL 4.1.0 and newer)? This property has no effect if the server sql-mode includes STRICT_TRANS_TABLES.	true	3.1.2
maxRows	The maximum number of rows to return (0, the default means return all rows).	-1	all versions
netTimeoutForStreamingResults	What value should the driver automatically set the server setting 'net_write_timeout' to when the streaming result sets feature is in use? (value has unit of seconds, the value '0' means the driver will not try and adjust this value)	600	5.1.0
noAccessToProcedureBodies	When determining procedure parameter types for CallableStatements, and the connected user can't access procedure bodies through "SHOW CREATE PROCEDURE" or select on mysql.proc should the driver instead create basic metadata (all parameters reported as IN VARCHARs, but allowing registerOutParameter() to be called on them anyway) instead of throwing an exception?	false	5.0.3
noDatetimeStringSync	Don't ensure that ResultSet.getDatetimeType().toString().equals(ResultSet.getString())	false	3.1.7
noTimezoneConversionForTimeType	Don't convert TIME values using the server timezone if 'useTimezone'='true'	false	5.0.0
nullCatalogMeansCurrent	When DatabaseMetadataMethods ask for a 'catalog' parameter, does the value null mean use the current catalog? (this is not JDBC-compliant, but follows legacy behavior from earlier versions)	true	3.1.8

	of the driver)		
nullNamePatternMatchesAll	Should DatabaseMetaData methods that accept *pattern parameters treat null the same as '%' (this is not JDBC-compliant, however older versions of the driver accepted this departure from the specification)	true	3.1.8
overrideSupportsIntegrityEnhancementFacility	Should the driver return "true" for DatabaseMetaData.supportsIntegrityEnhancementFacility() even if the database doesn't support it to workaround applications that require this method to return "true" to signal support of foreign keys, even though the SQL specification states that this facility contains much more than just foreign key support (one such application being OpenOffice)?	false	3.1.12
padCharsWithSpace	If a result set column has the CHAR type and the value does not fill the amount of characters specified in the DDL for the column, should the driver pad the remaining characters with space (for ANSI compliance)?	false	5.0.6
pedantic	Follow the JDBC spec to the letter.	false	3.0.0
pinGlobalTxToPhysicalConnection	When using XAConnections, should the driver ensure that operations on a given XID are always routed to the same physical connection? This allows the XAConnection to support "XA START ... JOIN" after "XA END" has been called	false	5.0.1
populateInsertRowWithDefaultValues	When using ResultSets that are CONCUR_UPDATABLE, should the driver pre-populate the "insert" row with default values from the DDL for the table used in the query so those values are immediately available for ResultSet accessors? This functionality requires a call to the database for metadata each time a result set of this type is created. If disabled (the default), the default values will be populated by the an internal call to refreshRow() which pulls back default values and/or values changed by triggers.	false	5.0.5
processEscapeCodesForPrepStmts	Should the driver process escape codes in queries that are prepared?	true	3.1.12
relaxAutoCommit	If the version of MySQL the driver connects to does not support transactions, still allow calls to commit(), rollback() and setAutoCommit() (true/false, defaults to 'false')?	false	2.0.13
retainStatementAfterResultSetClose	Should the driver retain the Statement reference in a ResultSet after ResultSet.close() has been called. This is not JDBC-compliant after JDBC-4.0.	false	3.1.11
rollbackOnPooledClose	Should the driver issue a rollback() when the logical connection in a pool is closed?	true	3.0.15
runningCTS13	Enables workarounds for bugs in Sun's JDBC compliance test-suite version 1.3	false	3.1.7
serverTimezone	Override detection/mapping of timezone. Used when timezone from server doesn't map to Java timezone		3.0.2
statementInterceptors	A comma-delimited list of classes that implement "com.mysql.jdbc.StatementInterceptor" that should be placed "in between" query execution to influence the results. StatementInterceptors are "chainable", the results returned by the "current" interceptor will be passed on to the next in the chain, from left-to-right order, as specified in this property.		5.1.1
strictFloatingPoint	Used only in older versions of compliance test	false	3.0.0
strictUpdates	Should the driver do strict checking (all primary keys selected) of updatable result sets (true, false, defaults to 'true')?	true	3.0.4
tinyInt1isBit	Should the driver treat the datatype TINYINT(1) as the BIT type (because the server silently converts BIT -> TINYINT(1) when creating tables)?	true	3.0.16
transformedBitsIsBoolean	If the driver converts TINYINT(1) to a different type, should it use BOOLEAN instead of BIT for future compatibility with MySQL-5.0, as MySQL-5.0 has a BIT type?	false	3.1.9
treatUtilDateAsTimestamp	Should the driver treat java.util.Date as a TIMESTAMP for the purposes of PreparedStatement.setObject()?	true	5.0.5

ultraDevHack	Create PreparedStatements for prepareCall() when required, because UltraDev is broken and issues a prepareCall() for <code>_all_</code> statements? (true/false, defaults to 'false')	false	2.0.3
useGmtMillisForDatetimes	Convert between session timezone and GMT before creating Date and Timestamp instances (value of "false" is legacy behavior, "true" leads to more JDBC-compliant behavior).	false	3.1.12
useHostsInPrivileges	Add '@hostname' to users in Database-MetaData.getColumn/TablePrivileges() (true/false), defaults to 'true'.	true	3.0.2
useInformationSchema	When connected to MySQL-5.0.7 or newer, should the driver use the INFORMATION_SCHEMA to derive information used by DatabaseMetaData?	false	5.0.0
useJDBCCompliantTimezoneShift	Should the driver use JDBC-compliant rules when converting TIME/TIMESTAMP/DATETIME values' timezone information for those JDBC arguments which take a java.util.Calendar argument? (Notice that this option is exclusive of the "use-Timezone=true" configuration option.)	false	5.0.0
useOldAliasMetadataBehavior	Should the driver use the legacy behavior for "AS" clauses on columns and tables, and only return aliases (if any) for ResultSetMetaData.getColumnNames() or ResultSetMetaData.getTableName() rather than the original column/table name?	false	5.0.4
useOldUTF8Behavior	Use the UTF-8 behavior the driver did when communicating with 4.0 and older servers	false	3.1.6
useOnlyServerErrorMessages	Don't prepend 'standard' SQLState error messages to error messages returned by the server.	true	3.0.15
useSSPSCompatibleTimezoneShift	If migrating from an environment that was using server-side prepared statements, and the configuration property "useJDBCCompliantTimezoneShift" set to "true", use compatible behavior when not using server-side prepared statements when sending TIMESTAMP values to the MySQL server.	false	5.0.5
useServerPrepStmts	Use server-side prepared statements if the server supports them?	false	3.1.0
useSqlStateCodes	Use SQL Standard state codes instead of 'legacy' X/Open/SQL state codes (true/false), default is 'true'	true	3.1.3
useStreamLengthsInPrepStmts	Honor stream length parameter in PreparedStatement/ResultSet.setXXXStream() method calls (true/false, defaults to 'true')?	true	3.0.2
useTimezone	Convert time/date types between client and server timezones (true/false, defaults to 'false')?	false	3.0.2
useUnbufferedInput	Don't use BufferedInputStream for reading data from the server	true	3.0.11
yearIsDateType	Should the JDBC driver treat the MySQL type "YEAR" as a java.sql.Date, or as a SHORT?	true	3.1.9
zeroDateTimeBehavior	What should happen when the driver encounters DATETIME values that are composed entirely of zeroes (used by MySQL to represent invalid dates)? Valid values are "exception", "round" and "convertToNull".	exception	3.1.4

Connector/J also supports access to MySQL via named pipes on Windows NT/2000/XP using the `NamedPipeSocketFactory` as a plugin-socket factory via the `socketFactory` property. If you don't use a `namedPipePath` property, the default of `\\.\pipe\MySQL` will be used. If you use the `NamedPipeSocketFactory`, the hostname and port number values in the JDBC url will be ignored. You can enable this feature using:

```
socketFactory=com.mysql.jdbc.NamedPipeSocketFactory
```

Named pipes only work when connecting to a MySQL server on the same physical machine as the one the JDBC driver is being used on. In simple performance tests, it appears that named pipe access is between 30%-50% faster than the standard TCP/IP access.

You can create your own socket factories by following the example code in `com.mysql.jdbc.NamedPipeSocketFactory`, or `com.mysql.jdbc.StandardSocketFactory`.

24.4.4.2. JDBC API Implementation Notes

MySQL Connector/J passes all of the tests in the publicly-available version of Sun's JDBC compliance test suite. However, in many places the JDBC specification is vague about how certain functionality should be implemented, or the specification allows leeway in implementation.

This section gives details on a interface-by-interface level about how certain implementation decisions may affect how you use MySQL Connector/J.

- **Blob**

Starting with Connector/J version 3.1.0, you can emulate Blobs with locators by adding the property 'emulateLocators=true' to your JDBC URL. Using this method, the driver will delay loading the actual Blob data until you retrieve the other data and then use retrieval methods (`getInputStream()`, `getBytes()`, and so forth) on the blob data stream.

For this to work, you must use a column alias with the value of the column to the actual name of the Blob, for example:

```
SELECT id, 'data' as blob_data from blobtable
```

For this to work, you must also follow these rules:

- The `SELECT` must also reference only one table, the table must have a primary key.
- The `SELECT` must alias the original blob column name, specified as a string, to an alternate name.
- The `SELECT` must cover all columns that make up the primary key.

The Blob implementation does not allow in-place modification (they are copies, as reported by the `DatabaseMetaData.locatorsUpdateCopies()` method). Because of this, you should use the corresponding `PreparedStatement.setBlob()` or `ResultSet.updateBlob()` (in the case of updatable result sets) methods to save changes back to the database.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about type conversion in the Knowledge Base article, [Type Conversions Supported by MySQL Connector/J](http://www.mysql.com/products/enterprise/advisors.html). To subscribe to MySQL Enterprise see <http://www.mysql.com/products/enterprise/advisors.html>.

- **CallableStatement**

Starting with Connector/J 3.1.1, stored procedures are supported when connecting to MySQL version 5.0 or newer via the `CallableStatement` interface. Currently, the `getParameterMetaData()` method of `CallableStatement` is not supported.

- **Clob**

The Clob implementation does not allow in-place modification (they are copies, as reported by the `DatabaseMetaData.locatorsUpdateCopies()` method). Because of this, you should use the `PreparedStatement.setClob()` method to save changes back to the database. The JDBC API does not have a `ResultSet.updateClob()` method.

- **Connection**

Unlike older versions of MM.MySQL the `isClosed()` method does not ping the server to determine if it is alive. In accordance with the JDBC specification, it only returns true if `closed()` has been called on the connection. If you need to determine if the connection is still valid, you should issue a simple query, such as `SELECT 1`. The driver will throw an exception if the connection is no longer valid.

- **DatabaseMetaData**

Foreign Key information (`getImportedKeys()/getExportedKeys()` and `getCrossReference()`) is only available from InnoDB tables. However, the driver uses `SHOW CREATE TABLE` to retrieve this information, so when other storage engines support foreign keys, the driver will transparently support them as well.

- **PreparedStatement**

PreparedStatements are implemented by the driver, as MySQL does not have a prepared statement feature. Because of this, the driver does not implement `getParameterMetaData()` or `getMetaData()` as it would require the driver to have a complete SQL parser in the client.

Starting with version 3.1.0 MySQL Connector/J, server-side prepared statements and binary-encoded result sets are used when the server supports them.

Take care when using a server-side prepared statement with **large** parameters that are set via `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()`, `setBlob()`, or `setClob()`. If you want to re-execute the statement with any large parameter changed to a non-large parameter, it is necessary to call `clearParameters()` and set all parameters again. The reason for this is as follows:

- During both server-side prepared statements and client-side emulation, large data is exchanged only when `PreparedStatement.execute()` is called.
- Once that has been done, the stream used to read the data on the client side is closed (as per the JDBC spec), and can't be read from again.
- If a parameter changes from large to non-large, the driver must reset the server-side state of the prepared statement to allow the parameter that is being changed to take the place of the prior large value. This removes all of the large data that has already been sent to the server, thus requiring the data to be re-sent, via the `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()`, `setBlob()` or `setClob()` methods.

Consequently, if you want to change the type of a parameter to a non-large one, you must call `clearParameters()` and set all parameters of the prepared statement again before it can be re-executed.

- **ResultSet**

By default, ResultSets are completely retrieved and stored in memory. In most cases this is the most efficient way to operate, and due to the design of the MySQL network protocol is easier to implement. If you are working with ResultSets that have a large number of rows or large values, and can not allocate heap space in your JVM for the memory required, you can tell the driver to stream the results back one row at a time.

To enable this functionality, you need to create a Statement instance in the following manner:

```
stmt = conn.createStatement( java.sql.ResultSet.TYPE_FORWARD_ONLY,
                             java.sql.ResultSet.CONCUR_READ_ONLY );
stmt.setFetchSize( Integer.MIN_VALUE );
```

The combination of a forward-only, read-only result set, with a fetch size of `Integer.MIN_VALUE` serves as a signal to the driver to stream result sets row-by-row. After this any result sets created with the statement will be retrieved row-by-row.

There are some caveats with this approach. You will have to read all of the rows in the result set (or close it) before you can issue any other queries on the connection, or an exception will be thrown.

The earliest the locks these statements hold can be released (whether they be **MyISAM** table-level locks or row-level locks in some other storage engine such as **InnoDB**) is when the statement completes.

If the statement is within scope of a transaction, then locks are released when the transaction completes (which implies that the statement needs to complete first). As with most other databases, statements are not complete until all the results pending on the statement are read or the active result set for the statement is closed.

Therefore, if using streaming results, you should process them as quickly as possible if you want to maintain concurrent access to the tables referenced by the statement producing the result set.

- **ResultSetMetaData**

The `isAutoIncrement()` method only works when using MySQL servers 4.0 and newer.

- **Statement**

When using versions of the JDBC driver earlier than 3.2.1, and connected to server versions earlier than 5.0.3, the `setFetchSize()` method has no effect, other than to toggle result set streaming as described above.

Connector/J 5.0.0 and later include support for both `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL 5.0.0 or newer server, and require a separate connection to issue the `KILL QUERY` statement. In the case of `setQueryTimeout()`, the implementation creates an additional thread to handle the timeout functionality.

Note

Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeException` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead.

MySQL does not support SQL cursors, and the JDBC driver doesn't emulate them, so "setCursorName()" has no effect.

Connector/J 5.1.3 and later include two additional methods:

- `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.

- `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.

This method returns `NULL` if no such stream has been set via `setLocalInfileInputStream()`.

24.4.4.3. Java, JDBC and MySQL Types

MySQL Connector/J is flexible in the way it handles conversions between MySQL data types and Java data types.

In general, any MySQL data type can be converted to a `java.lang.String`, and any numerical type can be converted to any of the Java numerical types, although round-off, overflow, or loss of precision may occur.

Starting with Connector/J 3.1.0, the JDBC driver will issue warnings or throw `DataTruncation` exceptions as is required by the JDBC specification unless the connection was configured not to do so by using the property `jdbcCompliantTruncation` and setting it to `false`.

The conversions that are always guaranteed to work are listed in the following table:

Connection Properties - Miscellaneous.

These MySQL Data Types	Can always be converted to these Java types
<code>CHAR</code> , <code>VARCHAR</code> , <code>BLOB</code> , <code>TEXT</code> , <code>ENUM</code> , and <code>SET</code>	<code>java.lang.String</code> , <code>java.io.InputStream</code> , <code>java.io.Reader</code> , <code>java.sql.Blob</code> , <code>java.sql.Clob</code>
<code>FLOAT</code> , <code>REAL</code> , <code>DOUBLE PRECISION</code> , <code>NUMERIC</code> , <code>DECIMAL</code> , <code>TINYINT</code> , <code>SMALLINT</code> , <code>MEDIUMINT</code> , <code>IN-</code> <code>TEGER</code> , <code>BIGINT</code>	<code>java.lang.String</code> , <code>java.lang.Short</code> , <code>java.lang.Integer</code> , <code>java.lang.Long</code> , <code>java.lang.Double</code> , <code>java.math.BigDecimal</code>
<code>DATE</code> , <code>TIME</code> , <code>DATETIME</code> , <code>TIMESTAMP</code>	<code>java.lang.String</code> , <code>java.sql.Date</code> , <code>java.sql.Timestamp</code>

Note

Round-off, overflow or loss of precision may occur if you choose a Java numeric data type that has less precision or capacity than the MySQL data type you are converting to/from.

The `ResultSet.getObject()` method uses the type conversions between MySQL and Java types, following the JDBC specification where appropriate. The value returned by `ResultSetMetaData.getColumnClassName()` is also shown below. For more information on the `java.sql.Types` classes see [Java 2 Platform Types](#).

MySQL Types to Java Types for `ResultSet.getObject()`.

MySQL Type Name	Return value of <code>getColumnClassName</code>	Returned as Java Class
<code>BIT(1)</code> (new in MySQL-5.0)	<code>BIT</code>	<code>java.lang.Boolean</code>
<code>BIT(> 1)</code> (new in MySQL-5.0)	<code>BIT</code>	<code>byte[]</code>
<code>TINYINT</code>	<code>TINYINT</code>	<code>java.lang.Boolean</code> if the configuration property <code>tinyIntIsBit</code> is set to <code>true</code> (the default) and the storage size is 1, or <code>java.lang.Integer</code> if not.
<code>BOOL</code> , <code>BOOLEAN</code>	<code>TINYINT</code>	See <code>TINYINT</code> , above as these are aliases for <code>TINYINT(1)</code> , currently.

SMALLINT[(M)] [UNSIGNED]	SMALLINT [UNSIGNED]	<code>java.lang.Integer</code> (regardless if UNSIGNED or not)
MEDIUMINT[(M)] [UNSIGNED]	MEDIUMINT [UNSIGNED]	<code>java.lang.Integer</code> , if UNSIGNED <code>java.lang.Long</code>
INT,INTEGER[(M)] [UNSIGNED]	INTEGER [UNSIGNED]	<code>java.lang.Integer</code> , if UNSIGNED <code>java.lang.Long</code>
BIGINT[(M)] [UNSIGNED]	BIGINT [UNSIGNED]	<code>java.lang.Long</code> , if UNSIGNED <code>java.math.BigInteger</code>
FLOAT[(M,D)]	FLOAT	<code>java.lang.Float</code>
DOUBLE[(M,B)]	DOUBLE	<code>java.lang.Double</code>
DECIMAL[(M[,D])]	DECIMAL	<code>java.math.BigDecimal</code>
DATE	DATE	<code>java.sql.Date</code>
DATETIME	DATETIME	<code>java.sql.Timestamp</code>
TIMESTAMP[(M)]	TIMESTAMP	<code>java.sql.Timestamp</code>
TIME	TIME	<code>java.sql.Time</code>
YEAR[(2 4)]	YEAR	If <code>yearIsDateType</code> configuration property is set to false, then the returned object type is <code>java.sql.Short</code> . If set to true (the default) then an object of type <code>java.sql.Date</code> (with the date set to January 1st, at midnight).
CHAR(M)	CHAR	<code>java.lang.String</code> (unless the character set for the column is BINARY, then <code>byte[]</code> is returned).
VARCHAR(M) [BINARY]	VARCHAR	<code>java.lang.String</code> (unless the character set for the column is BINARY, then <code>byte[]</code> is returned).
BINARY(M)	BINARY	<code>byte[]</code>
VARBINARY(M)	VARBINARY	<code>byte[]</code>
TINYBLOB	TINYBLOB	<code>byte[]</code>
TINYTEXT	VARCHAR	<code>java.lang.String</code>
BLOB	BLOB	<code>byte[]</code>
TEXT	VARCHAR	<code>java.lang.String</code>
MEDIUMBLOB	MEDIUMBLOB	<code>byte[]</code>
MEDIUMTEXT	VARCHAR	<code>java.lang.String</code>
LOBLOB	LOBLOB	<code>byte[]</code>
LONGTEXT	VARCHAR	<code>java.lang.String</code>
ENUM('value1','value2',...)	CHAR	<code>java.lang.String</code>
SET('value1','value2',...)	CHAR	<code>java.lang.String</code>

24.4.4.4. Using Character Sets and Unicode

All strings sent from the JDBC driver to the server are converted automatically from native Java Unicode form to the client character encoding, including all queries sent via `Statement.execute()`, `Statement.executeUpdate()`, `Statement.executeQuery()` as well as all `PreparedStatement` and `CallableStatement` parameters with the exclusion of parameters set using `setBytes()`, `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()` and `setBlob()`.

Prior to MySQL Server 4.1, Connector/J supported a single character encoding per connection, which could either be automatically detected from the server configuration, or could be configured by the user through the `useUnicode` and `characterEncoding` properties.

Starting with MySQL Server 4.1, Connector/J supports a single character encoding between client and server, and any number of character encodings for data returned by the server to the client in `ResultSets`.

The character encoding between client and server is automatically detected upon connection. The encoding used by the driver is specified on the server via the `character_set` system variable for server versions older than 4.1.0 and `character_set_server` for server versions 4.1.0 and newer. For more information, see [Section 9.3.1, “Server Character Set and Collation”](#).

To override the automatically-detected encoding on the client side, use the `characterEncoding` property in the URL used to

connect to the server.

When specifying character encodings on the client side, Java-style names should be used. The following table lists Java-style names for MySQL character sets:

MySQL to Java Encoding Name Translations.

MySQL Character Set Name	Java-Style Character Encoding Name
ascii	US-ASCII
big5	Big5
gbk	GBK
sjis	SJIS (or Cp932 or MS932 for MySQL Server < 4.1.11)
cp932	Cp932 or MS932 (MySQL Server > 4.1.11)
gb2312	EUC_CN
ujis	EUC_JP
euckr	EUC_KR
latin1	ISO8859_1
latin2	ISO8859_2
greek	ISO8859_7
hebrew	ISO8859_8
cp866	Cp866
tis620	TIS620
cp1250	Cp1250
cp1251	Cp1251
cp1257	Cp1257
macroman	MacRoman
macce	MacCentralEurope
utf8	UTF-8
ucs2	UnicodeBig

Warning

Do not issue the query 'set names' with Connector/J, as the driver will not detect that the character set has changed, and will continue to use the character set detected during the initial connection setup.

To allow multiple character sets to be sent from the client, the UTF-8 encoding should be used, either by configuring `utf8` as the default server character set, or by configuring the JDBC driver to use UTF-8 through the `characterEncoding` property.

24.4.4.5. Connecting Securely Using SSL

SSL in MySQL Connector/J encrypts all data (other than the initial handshake) between the JDBC driver and the server. The performance penalty for enabling SSL is an increase in query processing time between 35% and 50%, depending on the size of the query, and the amount of data it returns.

For SSL Support to work, you must have the following:

- A JDK that includes JSSE (Java Secure Sockets Extension), like JDK-1.4.1 or newer. SSL does not currently work with a JDK that you can add JSSE to, like JDK-1.2.x or JDK-1.3.x due to the following JSSE bug: <http://developer.java.sun.com/developer/bugParade/bugs/4273544.html>
- A MySQL server that supports SSL and has been compiled and configured to do so, which is MySQL-4.0.4 or later, see [Section 5.8.7, “Using Secure Connections”](#), for more information.
- A client certificate (covered later in this section)

You will first need to import the MySQL server CA Certificate into a Java truststore. A sample MySQL server CA Certificate is located in the [SSL](#) subdirectory of the MySQL source distribution. This is what SSL will use to determine if you are communicating with a secure MySQL server.

To use Java's `keytool` to create a truststore in the current directory, and import the server's CA certificate (`cacert.pem`), you can do the following (assuming that `keytool` is in your path. The `keytool` should be located in the `bin` subdirectory of your JDK or JRE):

```
shell> keytool -import -alias mysqlServerCACert \
              -file cacert.pem -keystore truststore
```

Keytool will respond with the following information:

```
Enter keystore password: *****
Owner: EMAILADDRESS=walrus@example.com, CN=Walrus,
      O=MySQL AB, L=Orenburg, ST=Some-State, C=RU
Issuer: EMAILADDRESS=walrus@example.com, CN=Walrus,
        O=MySQL AB, L=Orenburg, ST=Some-State, C=RU
Serial number: 0
Valid from:
  Fri Aug 02 16:55:53 CDT 2002 until: Sat Aug 02 16:55:53 CDT 2003
Certificate fingerprints:
  MD5:  61:91:A0:F2:03:07:61:7A:81:38:66:DA:19:C4:8D:AB
  SHA1: 25:77:41:05:D5:AD:99:8C:14:8C:CA:68:9C:2F:B8:89:C3:34:4D:6C
Trust this certificate? [no]: yes
Certificate was added to keystore
```

You will then need to generate a client certificate, so that the MySQL server knows that it is talking to a secure client:

```
shell> keytool -genkey -keyalg rsa \
            -alias mysqlClientCertificate -keystore keystore
```

Keytool will prompt you for the following information, and create a keystore named `keystore` in the current directory.

You should respond with information that is appropriate for your situation:

```
Enter keystore password: *****
What is your first and last name?
[Unknown]: Matthews
What is the name of your organizational unit?
[Unknown]: Software Development
What is the name of your organization?
[Unknown]: MySQL AB
What is the name of your City or Locality?
[Unknown]: Flossmoor
What is the name of your State or Province?
[Unknown]: IL
What is the two-letter country code for this unit?
[Unknown]: US
Is <CN=Matthews, OU=Software Development, O=MySQL AB,
L=Flossmoor, ST=IL, C=US> correct?
[no]: y

Enter key password for <mysqlClientCertificate>
(RETURN if same as keystore password):
```

Finally, to get JSSE to use the keystore and truststore that you have generated, you need to set the following system properties when you start your JVM, replacing `path_to_keystore_file` with the full path to the keystore file you created, `path_to_truststore_file` with the path to the truststore file you created, and using the appropriate password values for each property. You can do this either on the command line:

```
-Djavax.net.ssl.keyStore=path_to_keystore_file
-Djavax.net.ssl.keyStorePassword=password
-Djavax.net.ssl.trustStore=path_to_truststore_file
-Djavax.net.ssl.trustStorePassword=password
```

Or you can set the values directly within the application:

```
System.setProperty("javax.net.ssl.keyStore", "path_to_keystore_file");
System.setProperty("javax.net.ssl.keyStorePassword", "password");
System.setProperty("javax.net.ssl.trustStore", "path_to_truststore_file");
System.setProperty("javax.net.ssl.trustStorePassword", "password");
```

You will also need to set `useSSL` to `true` in your connection parameters for MySQL Connector/J, either by adding `useSSL=true` to your URL, or by setting the property `useSSL` to `true` in the `java.util.Properties` instance you pass to `DriverManager.getConnection()`.

You can test that SSL is working by turning on JSSE debugging (as detailed below), and look for the following key events:

```
...

JSSSE provides debugging (to STDOUT) when you set the following system property: `-Djavax.net.debug=all` This will tell you what keystores and truststores are being used, as well as what is going on during the SSL handshake and certificate exchange. It will be helpful when trying to determine what is not working when trying to get an SSL connection to happen.

24.4.4.6. Using Master/Slave Replication with ReplicationConnection

Starting with Connector/J 3.1.7, we've made available a variant of the driver that will automatically send queries to a read/write master, or a failover or round-robin loadbalanced set of slaves based on the state of `Connection.getReadOnly()`.

An application signals that it wants a transaction to be read-only by calling `Connection.setReadOnly(true)`, this replication-aware connection will use one of the slave connections, which are load-balanced per-vm using a round-robin scheme (a given connection is sticky to a slave unless that slave is removed from service). If you have a write transaction, or if you have a read that is time-sensitive (remember, replication in MySQL is asynchronous), set the connection to be not read-only, by calling `Connection.setReadOnly(false)` and the driver will ensure that further calls are sent to the master MySQL server. The driver takes care of propagating the current state of autocommit, isolation level, and catalog between all of the connections that it uses to accomplish this load balancing functionality.

To enable this functionality, use the "`com.mysql.jdbc.ReplicationDriver`" class when configuring your application server's connection pool or when creating an instance of a JDBC driver for your standalone application. Because it accepts the same URL format as the standard MySQL JDBC driver, `ReplicationDriver` does not currently work with `java.sql.DriverManager`-based connection creation unless it is the only MySQL JDBC driver registered with the `DriverManager`.

Here is a short, simple example of how `ReplicationDriver` might be used in a standalone application.

```

import java.sql.Connection;
import java.sql.ResultSet;
import java.util.Properties;

import com.mysql.jdbc.ReplicationDriver;

public class ReplicationDriverDemo {

    public static void main(String[] args) throws Exception {
        ReplicationDriver driver = new ReplicationDriver();

        Properties props = new Properties();

        // We want this for failover on the slaves
        props.put("autoReconnect", "true");

        // We want to load balance between the slaves
        props.put("roundRobinLoadBalance", "true");

        props.put("user", "foo");
        props.put("password", "bar");

        //
        // Looks like a normal MySQL JDBC url, with a
        // comma-separated list of hosts, the first
        // being the 'master', the rest being any number
        // of slaves that the driver will load balance against
        //
    }
}

```

```

Connection conn =
    driver.connect("jdbc:mysql://master,slave1,slave2,slave3/test",
        props);

//
// Perform read/write work on the master
// by setting the read-only flag to "false"
//

conn.setReadOnly(false);
conn.setAutoCommit(false);
conn.createStatement().executeUpdate("UPDATE some_table ...");
conn.commit();

//
// Now, do a query from a slave, the driver automatically picks one
// from the list
//

conn.setReadOnly(true);

ResultSet rs =
    conn.createStatement().executeQuery("SELECT a,b FROM alt_table");
    .....
}

```

You may also want to investigate the Load Balancing JDBC Pool (lbpool) tool, which provides a wrapper around the standard JDBC driver and allows you to use DB connection pools that includes checks for system failures and uneven load distribution. For more information, see [Load Balancing JDBC Pool \(lbpool\)](#).

24.4.4.7. Mapping MySQL Error Numbers to SQLStates

The table below provides a mapping of the MySQL Error Numbers to [SQL States](#)

Table 24.1. Mapping of MySQL Error Numbers to SQLStates

MySQL Error Number	MySQL Error Name	Legacy (X/Open) SQLState	SQL Standard SQLState

24.4.5. Connector/J Notes and Tips

24.4.5.1. Basic JDBC Concepts

This section provides some general JDBC background.

24.4.5.1.1. Connecting to MySQL Using the `DriverManager` Interface

When you are using JDBC outside of an application server, the `DriverManager` class manages the establishment of Connections.

The `DriverManager` needs to be told which JDBC drivers it should try to make Connections with. The easiest way to do this is to use `Class.forName()` on the class that implements the `java.sql.Driver` interface. With MySQL Connector/J, the name of this class is `com.mysql.jdbc.Driver`. With this method, you could use an external configuration file to supply the driver class name and driver parameters to use when connecting to a database.

The following section of Java code shows how you might register MySQL Connector/J from the `main()` method of your application:

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

// Notice, do not import com.mysql.jdbc.*
// or you will have problems!

public class LoadDriver {
    public static void main(String[] args) {
        try {
            // The newInstance() call is a work around for some
            // broken Java implementations

            Class.forName("com.mysql.jdbc.Driver").newInstance();
        } catch (Exception ex) {
            // handle the error
        }
    }
}
```

After the driver has been registered with the `DriverManager`, you can obtain a `Connection` instance that is connected to a particular database by calling `DriverManager.getConnection()`:

Example 24.1. Obtaining a connection from the `DriverManager`

This example shows how you can obtain a `Connection` instance from the `DriverManager`. There are a few different signatures for the `getConnection()` method. You should see the API documentation that comes with your JDK for more specific information on how to use them.

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

...
try {
    Connection conn =
        DriverManager.getConnection("jdbc:mysql://localhost/test?" +
                                   "user=monty&password=greatsqldb");

    // Do something with the Connection

    ...
} catch (SQLException ex) {
    // handle any errors
    System.out.println("SQLException: " + ex.getMessage());
    System.out.println("SQLState: " + ex.getSQLState());
    System.out.println("VendorError: " + ex.getErrorCode());
}
```

Once a `Connection` is established, it can be used to create `Statement` and `PreparedStatement` objects, as well as retrieve metadata about the database. This is explained in the following sections.

24.4.5.1.2. Using Statements to Execute SQL

`Statement` objects allow you to execute basic SQL queries and retrieve the results through the `ResultSet` class which is described later.

To create a `Statement` instance, you call the `createStatement()` method on the `Connection` object you have retrieved via one of the `DriverManager.getConnection()` or `DataSource.getConnection()` methods described earlier.

Once you have a `Statement` instance, you can execute a `SELECT` query by calling the `executeQuery(String)` method with the SQL you want to use.

To update data in the database, use the `executeUpdate(String SQL)` method. This method returns the number of rows affected by the update statement.

If you don't know ahead of time whether the SQL statement will be a `SELECT` or an `UPDATE/INSERT`, then you can use the `execute(String SQL)` method. This method will return true if the SQL query was a `SELECT`, or false if it was an `UPDATE`, `INSERT`, or `DELETE` statement. If the statement was a `SELECT` query, you can retrieve the results by calling the `getResultSet()` method. If the statement was an `UPDATE`, `INSERT`, or `DELETE` statement, you can retrieve the affected rows count by calling `getUpdateCount()` on the `Statement` instance.

Example 24.2. Using `java.sql.Statement` to execute a `SELECT` query

```
// assume that conn is an already created JDBC connection
Statement stmt = null;
ResultSet rs = null;
```

```

try {
    stmt = conn.createStatement();
    rs = stmt.executeQuery("SELECT foo FROM bar");

    // or alternatively, if you don't know ahead of time that
    // the query will be a SELECT...

    if (stmt.execute("SELECT foo FROM bar")) {
        rs = stmt.getResultSet();
    }

    // Now do something with the ResultSet ....
} finally {
    // it is a good idea to release
    // resources in a finally{} block
    // in reverse-order of their creation
    // if they are no-longer needed

    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException sqlEx) { // ignore }

        rs = null;
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException sqlEx) { // ignore }

        stmt = null;
    }
}

```

24.4.5.1.3. Using `CallableStatements` to Execute Stored Procedures

Starting with MySQL server version 5.0 when used with Connector/J 3.1.1 or newer, the `java.sql.CallableStatement` interface is fully implemented with the exception of the `getParameterMetaData()` method.

For more information on MySQL stored procedures, please refer to <http://dev.mysql.com/doc/mysql/en/stored-procedures.html>.

Connector/J exposes stored procedure functionality through JDBC's `CallableStatement` interface.

Note

Current versions of MySQL server do not return enough information for the JDBC driver to provide result set metadata for callable statements. This means that when using `CallableStatement`, `ResultSetMetaData` may return `NULL`.

The following example shows a stored procedure that returns the value of `inOutParam` incremented by 1, and the string passed in via `inputParam` as a `ResultSet`:

Example 24.3. Stored Procedures

```

CREATE PROCEDURE demoSp(IN inputParam VARCHAR(255), \
                       INOUT inOutParam INT)
BEGIN
    DECLARE z INT;
    SET z = inOutParam + 1;
    SET inOutParam = z;

    SELECT inputParam;

    SELECT CONCAT('zyxw', inputParam);
END

```

To use the `demoSp` procedure with Connector/J, follow these steps:

1. Prepare the callable statement by using `Connection.prepareCall()`.

Notice that you have to use JDBC escape syntax, and that the parentheses surrounding the parameter placeholders are not optional:

Example 24.4. Using `Connection.prepareCall()`

```

import java.sql.CallableStatement;

...

//
// Prepare a call to the stored procedure 'demoSp'
// with two parameters
//
// Notice the use of JDBC-escape syntax ({call ...})
//

CallableStatement cStmt = conn.prepareCall("{call demoSp(?, ?)}");

cStmt.setString(1, "abcdefg");

```

Note

`Connection.prepareCall()` is an expensive method, due to the metadata retrieval that the driver performs to support output parameters. For performance reasons, you should try to minimize unnecessary calls to `Connection.prepareCall()` by reusing `CallableStatement` instances in your code.

2. Register the output parameters (if any exist)

To retrieve the values of output parameters (parameters specified as `OUT` or `INOUT` when you created the stored procedure), JDBC requires that they be specified before statement execution using the various `registerOutputParameter()` methods in the `CallableStatement` interface:

Example 24.5. Registering output parameters

```

import java.sql.Types;
...
//
// Connector/J supports both named and indexed
// output parameters. You can register output
// parameters using either method, as well
// as retrieve output parameters using either
// method, regardless of what method was
// used to register them.
//
// The following examples show how to use
// the various methods of registering
// output parameters (you should of course
// use only one registration per parameter).
//
//
// Registers the second parameter as output, and
// uses the type 'INTEGER' for values returned from
// getObject()
//
cStmt.registerOutParameter(2, Types.INTEGER);

//
// Registers the named parameter 'inOutParam', and
// uses the type 'INTEGER' for values returned from
// getObject()
//
cStmt.registerOutParameter("inOutParam", Types.INTEGER);
...

```

3. Set the input parameters (if any exist)

Input and in/out parameters are set as for `PreparedStatement` objects. However, `CallableStatement` also supports setting parameters by name:

Example 24.6. Setting `CallableStatement` input parameters

```

...

//
// Set a parameter by index
//

cStmt.setString(1, "abcdefg");

```

```

//
// Alternatively, set a parameter using
// the parameter name
//
cStmt.setString("inputParameter", "abcdefg");

//
// Set the 'in/out' parameter using an index
//
cStmt.setInt(2, 1);

//
// Alternatively, set the 'in/out' parameter
// by name
//
cStmt.setInt("inOutParam", 1);

...

```

4. Execute the `CallableStatement`, and retrieve any result sets or output parameters.

Although `CallableStatement` supports calling any of the `Statement` execute methods (`executeUpdate()`, `executeQuery()` or `execute()`), the most flexible method to call is `execute()`, as you do not need to know ahead of time if the stored procedure returns result sets:

Example 24.7. Retrieving results and output parameter values

```

...

boolean hadResults = cStmt.execute();

//
// Process all returned result sets
//
while (hadResults) {
    ResultSet rs = cStmt.getResultSet();

    // process result set
    ...

    hadResults = rs.getMoreResults();
}

//
// Retrieve output parameters
//
// Connector/J supports both index-based and
// name-based retrieval
//

int outputValue = cStmt.getInt(2); // index-based

outputValue = cStmt.getInt("inOutParam"); // name-based

...

```

24.4.5.1.4. Retrieving `AUTO_INCREMENT` Column Values

Before version 3.0 of the JDBC API, there was no standard way of retrieving key values from databases that supported auto increment or identity columns. With older JDBC drivers for MySQL, you could always use a MySQL-specific method on the `Statement` interface, or issue the query `SELECT LAST_INSERT_ID()` after issuing an `INSERT` to a table that had an `AUTO_INCREMENT` key. Using the MySQL-specific method call isn't portable, and issuing a `SELECT` to get the `AUTO_INCREMENT` key's value requires another round-trip to the database, which isn't as efficient as possible. The following code snippets demonstrate the three different ways to retrieve `AUTO_INCREMENT` values. First, we demonstrate the use of the new JDBC-3.0 method `getGeneratedKeys()` which is now the preferred method to use if you need to retrieve `AUTO_INCREMENT` keys and have access to JDBC-3.0. The second example shows how you can retrieve the same value using a standard `SELECT LAST_INSERT_ID()` query. The final example shows how updatable result sets can retrieve the `AUTO_INCREMENT` value when using the `insertRow()` method.

Example 24.8. Retrieving `AUTO_INCREMENT` column values using `Statement.getGeneratedKeys()`

```

Statement stmt = null;
ResultSet rs = null;

try {

    //
    // Create a Statement instance that we can use for
    // 'normal' result sets assuming you have a
    // Connection 'conn' to a MySQL database already
    // available

    stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
                                java.sql.ResultSet.CONCUR_UPDATABLE);

    //
    // Issue the DDL queries for the table for this example
    //

    stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
    stmt.executeUpdate(
        "CREATE TABLE autoIncTutorial ( "
        + "priKey INT NOT NULL AUTO_INCREMENT, "
        + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

    //
    // Insert one row that will generate an AUTO INCREMENT
    // key in the 'priKey' field
    //

    stmt.executeUpdate(
        "INSERT INTO autoIncTutorial (dataField) "
        + "values ('Can I Get the Auto Increment Field?')",
        Statement.RETURN_GENERATED_KEYS);

    //
    // Example of using Statement.getGeneratedKeys()
    // to retrieve the value of an auto-increment
    // value
    //

    int autoIncKeyFromApi = -1;

    rs = stmt.getGeneratedKeys();

    if (rs.next()) {
        autoIncKeyFromApi = rs.getInt(1);
    } else {
        // throw an exception from here
    }

    rs.close();

    rs = null;

    System.out.println("Key returned from getGeneratedKeys():"
        + autoIncKeyFromApi);
} finally {

    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException ex) {
            // ignore
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}

```

Example 24.9. Retrieving `AUTO_INCREMENT` column values using `SELECT LAST_INSERT_ID()`

```

Statement stmt = null;
ResultSet rs = null;

try {

    //
    // Create a Statement instance that we can use for
    // 'normal' result sets.

    stmt = conn.createStatement();

    //
    // Issue the DDL queries for the table for this example

```

```

//
stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
stmt.executeUpdate(
    "CREATE TABLE autoIncTutorial ( "
    + "priKey INT NOT NULL AUTO_INCREMENT, "
    + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

//
// Insert one row that will generate an AUTO INCREMENT
// key in the 'priKey' field
//
stmt.executeUpdate(
    "INSERT INTO autoIncTutorial (dataField) "
    + "values ('Can I Get the Auto Increment Field?')");

//
// Use the MySQL LAST_INSERT_ID()
// function to do the same thing as getGeneratedKeys()
//

int autoIncKeyFromFunc = -1;
rs = stmt.executeQuery("SELECT LAST_INSERT_ID()");

if (rs.next()) {
    autoIncKeyFromFunc = rs.getInt(1);
} else {
    // throw an exception from here
}

rs.close();

System.out.println("Key returned from " +
    "SELECT LAST_INSERT_ID(): " +
    autoIncKeyFromFunc);
} finally {
    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException ex) {
            // ignore
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}
}

```

Example 24.10. Retrieving `AUTO_INCREMENT` column values in `Updatable ResultSets`

```

Statement stmt = null;
ResultSet rs = null;

try {
    //
    // Create a Statement instance that we can use for
    // 'normal' result sets as well as an 'updatable'
    // one, assuming you have a Connection 'conn' to
    // a MySQL database already available
    //
    stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
        java.sql.ResultSet.CONCUR_UPDATABLE);

    //
    // Issue the DDL queries for the table for this example
    //
    stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
    stmt.executeUpdate(
        "CREATE TABLE autoIncTutorial ( "
        + "priKey INT NOT NULL AUTO_INCREMENT, "
        + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

    //
    // Example of retrieving an AUTO INCREMENT key
    // from an updatable result set
    //
    rs = stmt.executeQuery("SELECT priKey, dataField "
        + "FROM autoIncTutorial");
}

```

```

rs.moveToInsertRow();

rs.updateString("dataField", "AUTO INCREMENT here?");
rs.insertRow();

//
// the driver adds rows at the end
//

rs.last();

//
// We should now be on the row we just inserted
//

int autoIncKeyFromRS = rs.getInt("priKey");

rs.close();

rs = null;

System.out.println("Key returned for inserted row: "
    + autoIncKeyFromRS);
} finally {
    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException ex) {
            // ignore
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}
}

```

When you run the preceding example code, you should get the following output: Key returned from `getGeneratedKeys()`: 1 Key returned from `SELECT LAST_INSERT_ID()`: 1 Key returned for inserted row: 2 You should be aware, that at times, it can be tricky to use the `SELECT LAST_INSERT_ID()` query, as that function's value is scoped to a connection. So, if some other query happens on the same connection, the value will be overwritten. On the other hand, the `getGeneratedKeys()` method is scoped by the `Statement` instance, so it can be used even if other queries happen on the same connection, but not on the same `Statement` instance.

24.4.5.2. Using Connector/J with J2EE and Other Java Frameworks

This section describes how to use Connector/J in several contexts.

24.4.5.2.1. General J2EE Concepts

This section provides general background on J2EE concepts that pertain to use of Connector/J.

24.4.5.2.1.1. Understanding Connection Pooling

Connection pooling is a technique of creating and managing a pool of connections that are ready for use by any thread that needs them.

This technique of pooling connections is based on the fact that most applications only need a thread to have access to a JDBC connection when they are actively processing a transaction, which usually take only milliseconds to complete. When not processing a transaction, the connection would otherwise sit idle. Instead, connection pooling allows the idle connection to be used by some other thread to do useful work.

In practice, when a thread needs to do work against a MySQL or other database with JDBC, it requests a connection from the pool. When the thread is finished using the connection, it returns it to the pool, so that it may be used by any other threads that want to use it.

When the connection is loaned out from the pool, it is used exclusively by the thread that requested it. From a programming point of view, it is the same as if your thread called `DriverManager.getConnection()` every time it needed a JDBC connection, however with connection pooling, your thread may end up using either a new, or already-existing connection.

Connection pooling can greatly increase the performance of your Java application, while reducing overall resource usage. The main benefits to connection pooling are:

- Reduced connection creation time

Although this is not usually an issue with the quick connection setup that MySQL offers compared to other databases, creating new JDBC connections still incurs networking and JDBC driver overhead that will be avoided if connections are recycled.

- Simplified programming model

When using connection pooling, each individual thread can act as though it has created its own JDBC connection, allowing you to use straight-forward JDBC programming techniques.

- Controlled resource usage

If you don't use connection pooling, and instead create a new connection every time a thread needs one, your application's resource usage can be quite wasteful and lead to unpredictable behavior under load.

Remember that each connection to MySQL has overhead (memory, CPU, context switches, and so forth) on both the client and server side. Every connection limits how many resources there are available to your application as well as the MySQL server. Many of these resources will be used whether or not the connection is actually doing any useful work!

Connection pools can be tuned to maximize performance, while keeping resource utilization below the point where your application will start to fail rather than just run slower.

Luckily, Sun has standardized the concept of connection pooling in JDBC through the JDBC-2.0 Optional interfaces, and all major application servers have implementations of these APIs that work fine with MySQL Connector/J.

Generally, you configure a connection pool in your application server configuration files, and access it via the Java Naming and Directory Interface (JNDI). The following code shows how you might use a connection pool from an application deployed in a J2EE application server:

Example 24.11. Using a connection pool with a J2EE application server

```
import java.sql.Connection;
import java.sql.SQLException;
import java.sql.Statement;

import javax.naming.InitialContext;
import javax.sql.DataSource;

public class MyServletJspOrEjb {

    public void doSomething() throws Exception {
        /*
         * Create a JNDI Initial context to be able to
         * lookup the DataSource
         *
         * In production-level code, this should be cached as
         * an instance or static variable, as it can
         * be quite expensive to create a JNDI context.
         *
         * Note: This code only works when you are using servlets
         * or EJBs in a J2EE application server. If you are
         * using connection pooling in standalone Java code, you
         * will have to create/configure datasources using whatever
         * mechanisms your particular connection pooling library
         * provides.
         */

        InitialContext ctx = new InitialContext();

        /*
         * Lookup the DataSource, which will be backed by a pool
         * that the application server provides. DataSource instances
         * are also a good candidate for caching as an instance
         * variable, as JNDI lookups can be expensive as well.
         */

        DataSource ds =
            (DataSource)ctx.lookup("java:comp/env/jdbc/MySQLDB");

        /*
         * The following code is what would actually be in your
         * Servlet, JSP or EJB 'service' method...where you need
         * to work with a JDBC connection.
         */

        Connection conn = null;
        Statement stmt = null;

        try {
            conn = ds.getConnection();

            /*
```

```

    * Now, use normal JDBC programming to work with
    * MySQL, making sure to close each resource when you're
    * finished with it, which allows the connection pool
    * resources to be recovered as quickly as possible
    */

    stmt = conn.createStatement();
    stmt.execute("SOME SQL QUERY");

    stmt.close();
    stmt = null;

    conn.close();
    conn = null;
} finally {
    /*
    * close any jdbc instances here that weren't
    * explicitly closed during normal code path, so
    * that we don't 'leak' resources...
    */

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException sqlex) {
            // ignore -- as we can't do anything about it here
        }

        stmt = null;
    }

    if (conn != null) {
        try {
            conn.close();
        } catch (SQLException sqlex) {
            // ignore -- as we can't do anything about it here
        }

        conn = null;
    }
}
}
}
}
}

```

As shown in the example above, after obtaining the JNDI InitialContext, and looking up the DataSource, the rest of the code should look familiar to anyone who has done JDBC programming in the past.

The most important thing to remember when using connection pooling is to make sure that no matter what happens in your code (exceptions, flow-of-control, and so forth), connections, and anything created by them (such as statements or result sets) are closed, so that they may be re-used, otherwise they will be stranded, which in the best case means that the MySQL server resources they represent (such as buffers, locks, or sockets) may be tied up for some time, or worst case, may be tied up forever.

What's the Best Size for my Connection Pool?

As with all other configuration rules-of-thumb, the answer is: it depends. Although the optimal size depends on anticipated load and average database transaction time, the optimum connection pool size is smaller than you might expect. If you take Sun's Java Petstore blueprint application for example, a connection pool of 15-20 connections can serve a relatively moderate load (600 concurrent users) using MySQL and Tomcat with response times that are acceptable.

To correctly size a connection pool for your application, you should create load test scripts with tools such as Apache JMeter or The Grinder, and load test your application.

An easy way to determine a starting point is to configure your connection pool's maximum number of connections to be unbounded, run a load test, and measure the largest amount of concurrently used connections. You can then work backward from there to determine what values of minimum and maximum pooled connections give the best performance for your particular application.

24.4.5.2.2. Using Connector/J with Tomcat

The following instructions are based on the instructions for Tomcat-5.x, available at <http://jakarta.apache.org/tomcat/tomcat-5.0-doc/jndi-datasource-examples-howto.html> which is current at the time this document was written.

First, install the .jar file that comes with Connector/J in `$(CATALINA_HOME)/common/lib` so that it is available to all applications installed in the container.

Next, Configure the JNDI DataSource by adding a declaration resource to `$(CATALINA_HOME)/conf/server.xml` in the context that defines your web application:

```

<Context ....>
...
<Resource name="jdbc/MySQLDB"

```

```

        auth="Container"
        type="javax.sql.DataSource"/>
<!-- The name you used above, must match _exactly_ here!

        The connection pool will be bound into JNDI with the name
        "java:/comp/env/jdbc/MySQLDB"
-->
<ResourceParams name="jdbc/MySQLDB">
  <parameter>
    <name>factory</name>
    <value>org.apache.commons.dbcp.BasicDataSourceFactory</value>
  </parameter>

  <!-- Don't set this any higher than max_connections on your
        MySQL server, usually this should be a 10 or a few 10's
        of connections, not hundreds or thousands -->

  <parameter>
    <name>maxActive</name>
    <value>10</value>
  </parameter>

  <!-- You don't want to many idle connections hanging around
        if you can avoid it, only enough to soak up a spike in
        the load -->

  <parameter>
    <name>maxIdle</name>
    <value>5</value>
  </parameter>

  <!-- Don't use autoReconnect=true, it's going away eventually
        and it's a crutch for older connection pools that couldn't
        test connections. You need to decide whether your application
        is supposed to deal with SQLExceptions (hint, it should), and
        how much of a performance penalty you're willing to pay
        to ensure 'freshness' of the connection -->

  <parameter>
    <name>validationQuery</name>
    <value>SELECT 1</value>
  </parameter>

  <!-- The most conservative approach is to test connections
        before they're given to your application. For most applications
        this is okay, the query used above is very small and takes
        no real server resources to process, other than the time used
        to traverse the network.

        If you have a high-load application you'll need to rely on
        something else. -->

  <parameter>
    <name>testOnBorrow</name>
    <value>true</value>
  </parameter>

  <!-- Otherwise, or in addition to testOnBorrow, you can test
        while connections are sitting idle -->

  <parameter>
    <name>testWhileIdle</name>
    <value>true</value>
  </parameter>

  <!-- You have to set this value, otherwise even though
        you've asked connections to be tested while idle,
        the idle evictor thread will never run -->

  <parameter>
    <name>timeBetweenEvictionRunsMillis</name>
    <value>10000</value>
  </parameter>

  <!-- Don't allow connections to hang out idle too long,
        never longer than what wait_timeout is set to on the
        server...A few minutes or even fraction of a minute
        is sometimes okay here, it depends on your application
        and how much spikey load it will see -->

  <parameter>
    <name>minEvictableIdleTimeMillis</name>
    <value>60000</value>
  </parameter>

  <!-- Username and password used when connecting to MySQL -->

  <parameter>
    <name>username</name>
    <value>someuser</value>
  </parameter>

  <parameter>
    <name>password</name>
    <value>somepass</value>

```

```

</parameter>
<!-- Class name for the Connector/J driver -->
<parameter>
  <name>driverClassName</name>
  <value>com.mysql.jdbc.Driver</value>
</parameter>
<!-- The JDBC connection url for connecting to MySQL, notice
that if you want to pass any other MySQL-specific parameters
you should pass them here in the URL, setting them using the
parameter tags above will have no effect, you will also
need to use &amp; to separate parameter values as the
ampersand is a reserved character in XML -->
<parameter>
  <name>url</name>
  <value>jdbc:mysql://localhost:3306/test</value>
</parameter>
</ResourceParams>
</Context>

```

In general, you should follow the installation instructions that come with your version of Tomcat, as the way you configure data-sources in Tomcat changes from time-to-time, and unfortunately if you use the wrong syntax in your XML file, you will most likely end up with an exception similar to the following:

```

Error: java.sql.SQLException: Cannot load JDBC driver class 'null ' SQL
state: null

```

24.4.5.2.3. Using Connector/J with JBoss

These instructions cover JBoss-4.x. To make the JDBC driver classes available to the application server, copy the .jar file that comes with Connector/J to the `lib` directory for your server configuration (which is usually called `default`). Then, in the same configuration directory, in the subdirectory named `deploy`, create a datasources configuration file that ends with `-ds.xml`, which tells JBoss to deploy this file as a JDBC Datasource. The file should have the following contents:

```

<datasources>
  <local-tx-datasource>
    <!-- This connection pool will be bound into JNDI with the name
         "java:/MySQLDB" -->
    <jndi-name>MySQLDB</jndi-name>
    <connection-url>jdbc:mysql://localhost:3306/dbname</connection-url>
    <driver-class>com.mysql.jdbc.Driver</driver-class>
    <user-name>user</user-name>
    <password>pass</password>

    <min-pool-size>5</min-pool-size>

    <!-- Don't set this any higher than max_connections on your
         MySQL server, usually this should be a 10 or a few 10's
         of connections, not hundreds or thousands -->
    <max-pool-size>20</max-pool-size>

    <!-- Don't allow connections to hang out idle too long,
         never longer than what wait_timeout is set to on the
         server...A few minutes is usually okay here,
         it depends on your application
         and how much spikey load it will see -->
    <idle-timeout-minutes>5</idle-timeout-minutes>

    <!-- If you're using Connector/J 3.1.8 or newer, you can use
         our implementation of these to increase the robustness
         of the connection pool. -->
    <exception-sorter-class-name>
com.mysql.jdbc.integration.jboss.ExtendedMysqlExceptionSorter
</exception-sorter-class-name>
    <valid-connection-checker-class-name>
com.mysql.jdbc.integration.jboss.MysqlValidConnectionChecker
</valid-connection-checker-class-name>

  </local-tx-datasource>
</datasources>

```

24.4.5.2.4. Using Connector/J with Spring

The Spring Framework is a Java-based application framework designed for assisting in application design by providing a way to configure components. The technique used by Spring is a well known design pattern called Dependency Injection (see [Inversion of Control Containers and the Dependency Injection pattern](#)). This article will focus on Java-oriented access to MySQL databases with Spring 2.0. For those wondering, there is a .NET port of Spring appropriately named Spring.NET.

Spring is not only a system for configuring components, but also includes support for aspect oriented programming (AOP). This is one of the main benefits and the foundation for Spring's resource and transaction management. Spring also provides utilities for integrating resource management with JDBC and Hibernate.

For the examples in this section the MySQL world sample database will be used. The first task is to setup a MySQL data source through Spring. Components within Spring use the "bean" terminology. For example, to configure a connection to a MySQL server supporting the world sample database you might use:

```
<util:map id="dbProps">
  <entry key="db.driver" value="com.mysql.jdbc.Driver"/>
  <entry key="db.jdbcurl" value="jdbc:mysql://localhost/world"/>
  <entry key="db.username" value="myuser"/>
  <entry key="db.password" value="mypass"/>
</util:map>
```

In the above example we are assigning values to properties that will be used in the configuration. For the datasource configuration:

```
<bean id="dataSource"
  class="org.springframework.jdbc.datasource.DriverManagerDataSource">
  <property name="driverClassName" value="${db.driver}"/>
  <property name="url" value="${db.jdbcurl}"/>
  <property name="username" value="${db.username}"/>
  <property name="password" value="${db.password}"/>
</bean>
```

The placeholders are used to provide values for properties of this bean. This means that you can specify all the properties of the configuration in one place instead of entering the values for each property on each bean. We do, however, need one more bean to pull this all together. The last bean is responsible for actually replacing the placeholders with the property values.

```
<bean
  class="org.springframework.beans.factory.config.PropertyPlaceholderConfigurer">
  <property name="properties" ref="dbProps"/>
</bean>
```

Now that we have our MySQL data source configured and ready to go, we write some Java code to access it. The example below will retrieve three random cities and their corresponding country using the data source we configured with Spring.

```
// Create a new application context. this processes the Spring config
ApplicationContext ctx =
  new ClassPathXmlApplicationContext("exlappContext.xml");
// Retrieve the data source from the application context
DataSource ds = (DataSource) ctx.getBean("dataSource");
// Open a database connection using Spring's DataSourceUtils
Connection c = DataSourceUtils.getConnection(ds);
try {
  // retrieve a list of three random cities
  PreparedStatement ps = c.prepareStatement(
    "select City.Name as 'City', Country.Name as 'Country' " +
    "from City inner join Country on City.CountryCode = Country.Code " +
    "order by rand() limit 3");
  ResultSet rs = ps.executeQuery();
  while(rs.next()) {
    String city = rs.getString("City");
    String country = rs.getString("Country");
    System.out.printf("The city %s is in %s\n", city, country);
  }
} catch (SQLException ex) {
  // something has failed and we print a stack trace to analyse the error
  ex.printStackTrace();
  // ignore failure closing connection
  try { c.close(); } catch (SQLException e) { }
} finally {
  // properly release our connection
  DataSourceUtils.releaseConnection(c, ds);
}
```

This is very similar to normal JDBC access to MySQL with the main difference being that we are using `DataSourceUtils` instead of the `DriverManager` to create the connection.

While it may seem like a small difference, the implications are somewhat far reaching. Spring manages this resource in a way similar to a container managed data source in a J2EE application server. When a connection is opened, it can be subsequently accessed in other parts of the code if it is synchronized with a transaction. This makes it possible to treat different parts of your application as transactional instead of passing around a database connection.

24.4.5.2.4.1. Using `JdbcTemplate`

Spring makes extensive use of the Template method design pattern (see [Template Method Pattern](#)). Our immediate focus will be on

the `JdbcTemplate` and related classes, specifically `NamedParameterJdbcTemplate`. The template classes handle obtaining and releasing a connection for data access when one is needed.

The next example shows how to use `NamedParameterJdbcTemplate` inside of a DAO (Data Access Object) class to retrieve a random city given a country code.

```
public class Ex2JdbcDao {
    /**
     * Data source reference which will be provided by Spring.
     */
    private DataSource dataSource;

    /**
     * Our query to find a random city given a country code. Notice
     * the ":country" parameter towards the end. This is called a
     * named parameter.
     */
    private String queryString = "select Name from City " +
        "where CountryCode = :country order by rand() limit 1";

    /**
     * Retrieve a random city using Spring JDBC access classes.
     */
    public String getRandomCityByCountryCode(String cntryCode) {
        // A template that allows using queries with named parameters
        NamedParameterJdbcTemplate template =
            new NamedParameterJdbcTemplate(dataSource);
        // A java.util.Map is used to provide values for the parameters
        Map params = new HashMap();
        params.put("country", cntryCode);
        // We query for an Object and specify what class we are expecting
        return (String)template.queryForObject(queryString, params, String.class);
    }

    /**
     * A JavaBean setter-style method to allow Spring to inject the data source.
     * @param dataSource
     */
    public void setDataSource(DataSource dataSource) {
        this.dataSource = dataSource;
    }
}
```

The focus in the above code is on the `getRandomCityByCountryCode()` method. We pass a country code and use the `NamedParameterJdbcTemplate` to query for a city. The country code is placed in a Map with the key "country", which is the parameter is named in the SQL query.

To access this code, you need to configure it with Spring by providing a reference to the data source.

```
<bean id="dao" class="code.Ex2JdbcDao">
  <property name="dataSource" ref="dataSource"/>
</bean>
```

At this point, we can just grab a reference to the DAO from Spring and call `getRandomCityByCountryCode()`.

```
// Create the application context
ApplicationContext ctx =
    new ClassPathXmlApplicationContext("ex2appContext.xml");
// Obtain a reference to our DAO
Ex2JdbcDao dao = (Ex2JdbcDao) ctx.getBean("dao");

String countryCode = "USA";

// Find a few random cities in the US
for(int i = 0; i < 4; ++i)
    System.out.printf("A random city in %s is %s\n", countryCode,
        dao.getRandomCityByCountryCode(countryCode));
```

This example shows how to use Spring's JDBC classes to completely abstract away the use of traditional JDBC classes including `Connection` and `PreparedStatement`.

24.4.5.2.4.2. Transactional JDBC Access

You might be wondering how we can add transactions into our code if we don't deal directly with the JDBC classes. Spring provides a transaction management package that not only replaces JDBC transaction management, but also allows declarative transaction management (configuration instead of code).

In order to use transactional database access, we will need to change the storage engine of the tables in the world database. The downloaded script explicitly creates MyISAM tables which do not support transactional semantics. The InnoDB storage engine does support transactions and this is what we will be using. We can change the storage engine with the following statements.

```
ALTER TABLE City ENGINE=InnoDB;
ALTER TABLE Country ENGINE=InnoDB;
```

```
ALTER TABLE CountryLanguage ENGINE=InnoDB;
```

A good programming practice emphasized by Spring is separating interfaces and implementations. What this means is that we can create a Java interface and only use the operations on this interface without any internal knowledge of what the actual implementation is. We will let Spring manage the implementation and with this it will manage the transactions for our implementation.

First you create a simple interface:

```
public interface Ex3Dao {
    Integer createCity(String name, String countryCode,
        String district, Integer population);
}
```

This interface contains one method that will create a new city record in the database and return the id of the new record. Next you need to create an implementation of this interface.

```
public class Ex3DaoImpl implements Ex3Dao {
    protected DataSource dataSource;
    protected SqlUpdate updateQuery;
    protected SqlFunction idQuery;

    public Integer createCity(String name, String countryCode,
        String district, Integer population) {
        updateQuery.update(new Object[] { name, countryCode,
            district, population });
        return getLastId();
    }

    protected Integer getLastId() {
        return idQuery.run();
    }
}
```

You can see that we only operate on abstract query objects here and don't deal directly with the JDBC API. Also, this is the complete implementation. All of our transaction management will be dealt with in the configuration. To get the configuration started, we need to create the DAO.

```
<bean id="dao" class="code.Ex3DaoImpl">
    <property name="dataSource" ref="dataSource"/>
    <property name="updateQuery">...</property>
    <property name="idQuery">...</property>
</bean>
```

Now you need to setup the transaction configuration. The first thing you must do is create transaction manager to manage the data source and a specification of what transaction properties are required for for the `dao` methods.

```
<bean id="transactionManager"
    class="org.springframework.jdbc.datasource.DataSourceTransactionManager">
    <property name="dataSource" ref="dataSource"/>
</bean>

<tx:advice id="txAdvice" transaction-manager="transactionManager">
    <tx:attributes>
        <tx:method name="*" />
    </tx:attributes>
</tx:advice>
```

The preceding code creates a transaction manager that handles transactions for the data source provided to it. The `txAdvice` uses this transaction manager and the attributes specify to create a transaction for all methods. Finally you need to apply this advice with an AOP pointcut.

```
<aop:config>
    <aop:pointcut id="daoMethods"
        expression="execution(* code.Ex3Dao.*(..))"/>
    <aop:advisor advice-ref="txAdvice" pointcut-ref="daoMethods"/>
</aop:config>
```

This basically says that all methods called on the `Ex3Dao` interface will be wrapped in a transaction. To make use of this, you only have to retrieve the `dao` from the application context and call a method on the `dao` instance.

```
Ex3Dao dao = (Ex3Dao) ctx.getBean("dao");
Integer id = dao.createCity(name, countryCode, district, pop);
```

We can verify from this that there is no transaction management happening in our Java code and it's all configured with Spring. This is a very powerful notion and regarded as one of the most beneficial features of Spring.

24.4.5.2.4.3. Connection Pooling

In many situations, such as web applications, there will be a large number of small database transactions. When this is the case, it usually makes sense to create a pool of database connections available for web requests as needed. Although MySQL does not spawn an extra process when a connection is made, there is still a small amount of overhead to create and setup the connection. Pooling of connections also alleviates problems such as collecting large amounts of sockets in the `TIME_WAIT` state.

Setting up pooling of MySQL connections with Spring is as simple as changing the data source configuration in the application context. There are a number of configurations that we can use. The first example is based on the [Jakarta Commons DBCP library](#). The example below replaces the source configuration that was based on `DriverManagerDataSource` with DBCP's `BasicDataSource`.

```
<bean id="dataSource" destroy-method="close"
  class="org.apache.commons.dbcp.BasicDataSource">
  <property name="driverClassName" value="${db.driver}"/>
  <property name="url" value="${db.jdbcurl}"/>
  <property name="username" value="${db.username}"/>
  <property name="password" value="${db.password}"/>
  <property name="initialSize" value="3"/>
</bean>
```

The configuration of the two solutions is very similar. The difference is that DBCP will pool connections to the database instead of creating a new connection every time one is requested. We have also set a parameter here called `initialSize`. This tells DBCP that we want three connections in the pool when it is created.

Another way to configure connection pooling is to configure a data source in our J2EE application server. Using JBoss as an example, you can set up the MySQL connection pool by creating a file called `mysql-local-ds.xml` and placing it in the `server/default/deploy` directory in JBoss. Once we have this setup, we can use JNDI to look it up. With Spring, this lookup is very simple. The data source configuration looks like this.

```
<jee:jndi-lookup id="dataSource" jndi-name="java:MySQL_DS"/>
```

24.4.5.3. Common Problems and Solutions

There are a few issues that seem to be commonly encountered often by users of MySQL Connector/J. This section deals with their symptoms, and their resolutions.

Questions

- **25.4.5.3.1:** When I try to connect to the database with MySQL Connector/J, I get the following exception:

```
SQLException: Server configuration denies access to data source
SQLState: 08001
VendorError: 0
```

What's going on? I can connect just fine with the MySQL command-line client.

- **25.4.5.3.2:** My application throws an `SQLException` 'No Suitable Driver'. Why is this happening?
- **25.4.5.3.3:** I'm trying to use MySQL Connector/J in an applet or application and I get an exception similar to:

```
SQLException: Cannot connect to MySQL server on host:3306.
Is there a MySQL server running on the machine/port you
are trying to connect to?

(java.security.AccessControlException)
SQLState: 08S01
VendorError: 0
```

- **25.4.5.3.4:** I have a servlet/application that works fine for a day, and then stops working overnight
- **25.4.5.3.5:** I'm trying to use JDBC-2.0 updatable result sets, and I get an exception saying my result set is not updatable.
- **25.4.5.3.6:** I cannot connect to the MySQL server using Connector/J, and I'm sure the connection parameters are correct.
- **25.4.5.3.7:** I am trying to connect to my MySQL server within my application, but I get the following error and stack trace:

```
java.net.SocketException
MESSAGE: Software caused connection abort: recv failed

STACKTRACE:

java.net.SocketException: Software caused connection abort: recv failed
at java.net.SocketInputStream.socketRead0(Native Method)
at java.net.SocketInputStream.read(Unknown Source)

- **25.4.5.3.8:** My application is deployed through JBoss and I am using transactions to handle the statements on the MySQL database. Under heavy loads I am getting a error and stack trace, but these only occur after a fixed period of heavy activity.
- **25.4.5.3.9:** When using `gcj` an `java.io.CharConversionException` is raised when working with certain character sequences.
- **25.4.5.3.10:** Updating a table that contains a primary key that is either `FLOAT` or compound primary key that uses `FLOAT` fails to update the table and raises an exception.

Questions and Answers

25.4.5.3.1: When I try to connect to the database with MySQL Connector/J, I get the following exception:

```
SQLException: Server configuration denies access to data source
SQLState: 08001
VendorError: 0
```

What's going on? I can connect just fine with the MySQL command-line client.

MySQL Connector/J must use TCP/IP sockets to connect to MySQL, as Java does not support Unix Domain Sockets. Therefore, when MySQL Connector/J connects to MySQL, the security manager in MySQL server will use its grant tables to determine whether the connection should be allowed.

You must add the necessary security credentials to the MySQL server for this to happen, using the `GRANT` statement to your MySQL Server. See [Section 12.5.1.3, “GRANT Syntax”](#), for more information.

Note

Testing your connectivity with the `mysql` command-line client will not work unless you add the `--host` flag, and use something other than `localhost` for the host. The `mysql` command-line client will use Unix domain sockets if you use the special hostname `localhost`. If you are testing connectivity to `localhost`, use `127.0.0.1` as the hostname instead.

Warning

Changing privileges and permissions improperly in MySQL can potentially cause your server installation to not have optimal security properties.

25.4.5.3.2: My application throws an SQLException 'No Suitable Driver'. Why is this happening?

There are three possible causes for this error:

- The Connector/J driver is not in your `CLASSPATH`, see [Section 24.4.2, “Connector/J Installation”](#).
- The format of your connection URL is incorrect, or you are referencing the wrong JDBC driver.
- When using `DriverManager`, the `jdbc.drivers` system property has not been populated with the location of the Connector/J driver.

25.4.5.3.3: I'm trying to use MySQL Connector/J in an applet or application and I get an exception similar to:

```
SQLException: Cannot connect to MySQL server on host:3306.
Is there a MySQL server running on the machine/port you
are trying to connect to?

(java.security.AccessControlException)
SQLState: 08S01
VendorError: 0
```

Either you're running an Applet, your MySQL server has been installed with the `--skip-networking` option set, or your MySQL server has a firewall sitting in front of it.

Applets can only make network connections back to the machine that runs the web server that served the `.class` files for the applet. This means that MySQL must run on the same machine (or you must have some sort of port re-direction) for this to work. This also means that you will not be able to test applets from your local file system, you must always deploy them to a web server.

MySQL Connector/J can only communicate with MySQL using TCP/IP, as Java does not support Unix domain sockets. TCP/IP communication with MySQL might be affected if MySQL was started with the "--skip-networking" flag, or if it is firewalled.

If MySQL has been started with the "--skip-networking" option set (the Debian Linux package of MySQL server does this for example), you need to comment it out in the file /etc/mysql/my.cnf or /etc/my.cnf. Of course your my.cnf file might also exist in the `data` directory of your MySQL server, or anywhere else (depending on how MySQL was compiled for your system). Binaries created by MySQL AB always look in /etc/my.cnf and [datadir]/my.cnf. If your MySQL server has been firewalled, you will need to have the firewall configured to allow TCP/IP connections from the host where your Java code is running to the MySQL server on the port that MySQL is listening to (by default, 3306).

25.4.5.3.4: I have a servlet/application that works fine for a day, and then stops working overnight

MySQL closes connections after 8 hours of inactivity. You either need to use a connection pool that handles stale connections or use the "autoReconnect" parameter (see [Section 24.4.4.1, "Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J"](#)).

Also, you should be catching `SQLException`s in your application and dealing with them, rather than propagating them all the way until your application exits, this is just good programming practice. MySQL Connector/J will set the `SQLState` (see `java.sql.SQLException.getSQLState()` in your APIDocs) to "08S01" when it encounters network-connectivity issues during the processing of a query. Your application code should then attempt to re-connect to MySQL at this point.

The following (simplistic) example shows what code that can handle these exceptions might look like:

Example 24.12. Example of transaction with retry logic

```
public void doBusinessOp() throws SQLException {
    Connection conn = null;
    Statement stmt = null;
    ResultSet rs = null;

    //
    // How many times do you want to retry the transaction
    // (or at least _getting_ a connection)?
    //
    int retryCount = 5;

    boolean transactionCompleted = false;

    do {
        try {
            conn = getConnection(); // assume getting this from a
                                   // javax.sql.DataSource, or the
                                   // java.sql.DriverManager

            conn.setAutoCommit(false);

            //
            // Okay, at this point, the 'retry-ability' of the
            // transaction really depends on your application logic,
            // whether or not you're using autocommit (in this case
            // not), and whether you're using transactional storage
            // engines
            //
            // For this example, we'll assume that it's _not_ safe
            // to retry the entire transaction, so we set retry
            // count to 0 at this point
            //
            // If you were using exclusively transaction-safe tables,
            // or your application could recover from a connection going
            // bad in the middle of an operation, then you would not
            // touch 'retryCount' here, and just let the loop repeat
            // until retryCount == 0.
            //
            retryCount = 0;

            stmt = conn.createStatement();

            String query = "SELECT foo FROM bar ORDER BY baz";

            rs = stmt.executeQuery(query);

            while (rs.next()) {
            }

            rs.close();
            rs = null;

            stmt.close();
            stmt = null;

            conn.commit();
            conn.close();
            conn = null;
        }
    }
}
```

```

        transactionCompleted = true;
    } catch (SQLException sqlEx) {

        //
        // The two SQL states that are 'retry-able' are 08S01
        // for a communications error, and 40001 for deadlock.
        //
        // Only retry if the error was due to a stale connection,
        // communications problem or deadlock
        //
        String sqlState = sqlEx.getSQLState();

        if ("08S01".equals(sqlState) || "40001".equals(sqlState)) {
            retryCount--;
        } else {
            retryCount = 0;
        }
    } finally {
        if (rs != null) {
            try {
                rs.close();
            } catch (SQLException sqlEx) {
                // You'd probably want to log this . . .
            }
        }

        if (stmt != null) {
            try {
                stmt.close();
            } catch (SQLException sqlEx) {
                // You'd probably want to log this as well . . .
            }
        }

        if (conn != null) {
            try {
                //
                // If we got here, and conn is not null, the
                // transaction should be rolled back, as not
                // all work has been done

                try {
                    conn.rollback();
                } finally {
                    conn.close();
                }
            } catch (SQLException sqlEx) {
                //
                // If we got an exception here, something
                // pretty serious is going on, so we better
                // pass it up the stack, rather than just
                // logging it. . .

                throw sqlEx;
            }
        }
    }
} while (!transactionCompleted && (retryCount > 0));
}

```

Note

Use of the `autoReconnect` option is not recommended because there is no safe method of reconnecting to the MySQL server without risking some corruption of the connection state or database state information. Instead, you should use a connection pool which will enable your application to connect to the MySQL server using an available connection from the pool. The `autoReconnect` facility is deprecated, and may be removed in a future release.

25.4.5.3.5: I'm trying to use JDBC-2.0 updatable result sets, and I get an exception saying my result set is not updatable.

Because MySQL does not have row identifiers, MySQL Connector/J can only update result sets that have come from queries on tables that have at least one primary key, the query must select every primary key and the query can only span one table (that is, no joins). This is outlined in the JDBC specification.

Note that this issue only occurs when using updatable result sets, and is caused because Connector/J is unable to guarantee that it can identify the correct rows within the result set to be updated without having a unique reference to each row. There is no requirement to have a unique field on a table if you are using `UPDATE` or `DELETE` statements on a table where you can individually specify the criteria to be matched using a `WHERE` clause.

25.4.5.3.6: I cannot connect to the MySQL server using Connector/J, and I'm sure the connection parameters are correct.

Make sure that the `skip-networking` option has not been enabled on your server. Connector/J must be able to communicate with your server over TCP/IP, named sockets are not supported. Also ensure that you are not filtering connections through a Firewall or other network security system. For more information, see [Section B.1.2.2, "Can't connect to \[local\] MySQL server"](#).

25.4.5.3.7: I am trying to connect to my MySQL server within my application, but I get the following error and stack trace:

```
java.net.SocketException
MESSAGE: Software caused connection abort: recv failed

STACKTRACE:

java.net.SocketException: Software caused connection abort: recv failed
at java.net.SocketInputStream.socketRead0(Native Method)
at java.net.SocketInputStream.read(Unknown Source)
at com.mysql.jdbc.MySQLIO.readFully(MySQLIO.java:1392)
at com.mysql.jdbc.MySQLIO.readPacket(MySQLIO.java:1414)
at com.mysql.jdbc.MySQLIO.doHandshake(MySQLIO.java:625)
at com.mysql.jdbc.Connection.createNewIO(Connection.java:1926)
at com.mysql.jdbc.Connection.<init>(Connection.java:452)
at com.mysql.jdbc.NonRegisteringDriver.connect(NonRegisteringDriver.java:411)
```

The error probably indicates that you are using an older version of the Connector/J JDBC driver (2.0.14 or 3.0.x) and you are trying to connect to a MySQL server with version 4.1x or newer. The older drivers are not compatible with 4.1 or newer of MySQL as they do not support the newer authentication mechanisms.

It is likely that the older version of the Connector/J driver exists within your application directory or your `CLASSPATH` includes the older Connector/J package.

25.4.5.3.8: My application is deployed through JBoss and I am using transactions to handle the statements on the MySQL database. Under heavy loads I am getting an error and stack trace, but these only occur after a fixed period of heavy activity.

This is a JBoss, not Connector/J, issue and is connected to the use of transactions. Under heavy loads the time taken for transactions to complete can increase, and the error is caused because you have exceeded the predefined timeout.

You can increase the timeout value by setting the `TransactionTimeout` attribute to the `TransactionManagerService` within the `/conf/jboss-service.xml` file (pre-4.0.3) or `/deploy/jta-service.xml` for JBoss 4.0.3 or later. See [TransactionTimeout](#) within the JBoss wiki for more information.

25.4.5.3.9: When using gcj an java.io.CharConversionException is raised when working with certain character sequences.

This is a known issue with `gcj` which raises an exception when it reaches an unknown character or one it cannot convert. You should add `useJvmCharsetConverters=true` to your connection string to force character conversion outside of the `gcj` libraries, or try a different JDK.

25.4.5.3.10: Updating a table that contains a primary key that is either FLOAT or compound primary key that uses FLOAT fails to update the table and raises an exception.

Connector/J adds conditions to the `WHERE` clause during an `UPDATE` to check the old values of the primary key. If there is no match then Connector/J considers this a failure condition and raises an exception.

The problem is that rounding differences between supplied values and the values stored in the database may mean that the values never match, and hence the update fails. The issue will affect all queries, not just those from Connector/J.

To prevent this issue, use a primary key that does not use `FLOAT`. If you have to use a floating point column in your primary key use `DOUBLE` or `DECIMAL` types in place of `FLOAT`.

24.4.6. Connector/J Support

24.4.6.1. Connector/J Community Support

MySQL AB provides assistance to the user community by means of its mailing lists. For Connector/J related issues, you can get help from experienced users by using the MySQL and Java mailing list. Archives and subscription information is available online at <http://lists.mysql.com/java>.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See [Section 1.7.1, "MySQL Mailing Lists"](#).

Community support from experienced users is also available through the [JDBC Forum](#). You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See [Section 1.7.2, "MySQL Community Support at the MySQL Forums"](#).

24.4.6.2. How to Report Connector/J Bugs or Problems

The normal place to report bugs is <http://bugs.mysql.com/>, which is the address for our bugs database. This database is public, and can be browsed and searched by anyone. If you log in to the system, you will also be able to enter new reports.

If you have found a sensitive security bug in MySQL, you can send email to [<security@mysql.com>](mailto:security@mysql.com).

Writing a good bug report takes patience, but doing it right the first time saves time both for us and for yourself. A good bug report, containing a full test case for the bug, makes it very likely that we will fix the bug in the next release.

This section will help you write your report correctly so that you don't waste your time doing things that may not help us much or at all.

If you have a repeatable bug report, please report it to the bugs database at <http://bugs.mysql.com/>. Any bug that we are able to repeat has a high chance of being fixed in the next MySQL release.

To report other problems, you can use one of the MySQL mailing lists.

Remember that it is possible for us to respond to a message containing too much information, but not to one containing too little. People often omit facts because they think they know the cause of a problem and assume that some details don't matter.

A good principle is this: If you are in doubt about stating something, state it. It is faster and less troublesome to write a couple more lines in your report than to wait longer for the answer if we must ask you to provide information that was missing from the initial report.

The most common errors made in bug reports are (a) not including the version number of Connector/J or MySQL used, and (b) not fully describing the platform on which Connector/J is installed (including the JVM version, and the platform type and version number that MySQL itself is installed on).

This is highly relevant information, and in 99 cases out of 100, the bug report is useless without it. Very often we get questions like, "Why doesn't this work for me?" Then we find that the feature requested wasn't implemented in that MySQL version, or that a bug described in a report has already been fixed in newer MySQL versions.

Sometimes the error is platform-dependent; in such cases, it is next to impossible for us to fix anything without knowing the operating system and the version number of the platform.

If at all possible, you should create a repeatable, standalone testcase that doesn't involve any third-party classes.

To streamline this process, we ship a base class for testcases with Connector/J, named `'com.mysql.jdbc.util.BaseBugReport'`. To create a testcase for Connector/J using this class, create your own class that inherits from `com.mysql.jdbc.util.BaseBugReport` and override the methods `setUp()`, `tearDown()` and `runTest()`.

In the `setUp()` method, create code that creates your tables, and populates them with any data needed to demonstrate the bug.

In the `runTest()` method, create code that demonstrates the bug using the tables and data you created in the `setUp` method.

In the `tearDown()` method, drop any tables you created in the `setUp()` method.

In any of the above three methods, you should use one of the variants of the `getConnection()` method to create a JDBC connection to MySQL:

- `getConnection()` - Provides a connection to the JDBC URL specified in `getUrl()`. If a connection already exists, that connection is returned, otherwise a new connection is created.
- `getNewConnection()` - Use this if you need to get a new connection for your bug report (i.e. there's more than one connection involved).
- `getConnection(String url)` - Returns a connection using the given URL.
- `getConnection(String url, Properties props)` - Returns a connection using the given URL and properties.

If you need to use a JDBC URL that is different from `'jdbc:mysql://test'`, override the method `getUrl()` as well.

Use the `assertTrue(boolean expression)` and `assertTrue(String failureMessage, boolean expression)` methods to create conditions that must be met in your testcase demonstrating the behavior you are expecting (vs. the behavior you are observing, which is why you are most likely filing a bug report).

Finally, create a `main()` method that creates a new instance of your testcase, and calls the `run` method:

```
public static void main(String[] args) throws Exception {
    new MyBugReport().run();
}
```

Once you have finished your testcase, and have verified that it demonstrates the bug you are reporting, upload it with your bug report to <http://bugs.mysql.com/>.

24.4.6.3. Connector/J Change History

The Connector/J Change History (Changelog) is located with the main Changelog for MySQL. See [Section E.6, “MySQL Connector/J Change History”](#).

24.5. MySQL Connector/MXJ

MySQL Connector/MXJ is a solution for deploying the MySQL database engine (`mysqld`) intelligently from within a Java package.

24.5.1. Introduction to Connector/MXJ

MySQL Connector/MXJ is a Java Utility package for deploying and managing a MySQL database. Deploying and using MySQL can be as easy as adding an additional parameter to the JDBC connection url, which will result in the database being started when the first connection is made. This makes it easy for Java developers to deploy applications which require a database by reducing installation barriers for their end-users.

MySQL Connector/MXJ makes the MySQL database appear to be a java-based component. It does this by determining what platform the system is running on, selecting the appropriate binary, and launching the executable. It will also optionally deploy an initial database, with any specified parameters.

Included are instructions for use with a JDBC driver and deploying as a JMX MBean to JBoss.

You can download sources and binaries from: <http://dev.mysql.com/downloads/connector/mxj/>

This a beta release and feedback is welcome and encouraged.

Please send questions or comments to the [MySQL and Java mailing list](#).

24.5.1.1. Connector/MXJ Versions

Connector/MX

- Connector/MXJ 5.x, currently in beta status, includes `mysqld` version 5.x and includes binaries for Linux x86, Mac OS X PPC, Windows XP/NT/2000 x86 and Solaris SPARC. Connector/MXJ 5.x requires the Connector/J 5.x package.

The exact version of `mysqld` included depends on the version of Connector/MXJ

- Connector/MXJ v5.0.3 included MySQL v5.0.22
 - Connector/MXJ v5.0.4 includes MySQL v5.0.27 (Community) or MySQL v5.0.32 (Enterprise)
 - Connector/MXJ v5.0.6 includes MySQL 5.0.37 (Community)
- Connector/MXJ 1.x includes `mysqld` version 4.1.13 and includes binaries for Linux x86, Windows XP/NT/2000 x86 and Solaris SPARC. Connector/MXJ 1.x requires the Connector/J 3.x package.

A summary of the different MySQL versions supplied with each Connector/MXJ release are shown in the table.

Connector/MXJ Version	MySQL Version(s)
5.0.6	5.0.37 (CS), 5.0.40 (ES)
5.0.5	5.0.37 (CS), 5.0.36 (ES)
5.0.4	5.0.27 (CS), 5.0.32 (ES)
5.0.3	5.0.22
5.0.2	5.0.19

This guide provides information on the Connector/MXJ 5.x release. For information on using the older releases, please see the documentation included with the appropriate distribution.

24.5.1.2. Connector/MXJ Overview

Connector/MXJ consists of a Java class, a copy of the `mysqld` binary for a specific list of platforms, and associated files and support utilities. The Java class controls the initialization of an instance of the embedded `mysqld` binary, and the ongoing management of the `mysqld` process. The entire sequence and management can be controlled entirely from within Java using the Connector/MXJ Java classes. You can see an overview of the contents of the Connector/MXJ package in the figure below.

It is important to note that Connector/MXJ is not an embedded version of MySQL, or a version of MySQL written as part of a Java class. Connector/MXJ works through the use of an embedded, compiled binary of `mysqld` as would normally be used when deploying a standard MySQL installation.

It is the Connector/MXJ wrapper, support classes and tools, that enable Connector/MXJ to appear as a MySQL instance.

When Connector/MXJ is initialized, the corresponding `mysqld` binary for the current platform is extracted, along with a pre-configured data directed. Both are contained within the Connector/MXJ JAR file. The `mysqld` instance is then started, with any additional options as specified during the initialization, and the MySQL database becomes accessible.

Because Connector/MXJ works in combination with Connector/J, you can access and integrate with the MySQL instance through a JDBC connection. When you have finished with the server, the instance is terminated, and, by default, any data created during the session is retained within the temporary directory created when the instance was started.

Connector/MXJ and the embedded `mysqld` instance can be deployed in a number of environments where relying on an existing database, or installing a MySQL instance would be impossible, including CD-ROM embedded database applications and temporary database requirements within a Java-based application environment.

24.5.2. Connector/MXJ Installation

Connector/MXJ does not have a installation application or process, but there are some steps you can follow to make the installation and deployment of Connector/MXJ easier.

Before you start, there are some baseline requirements for

- Java Runtime Environment (v1.4.0 or newer) if you are only going to deploy the package.
- Java Development Kit (v1.4.0 or newer) if you want to build Connector/MXJ from source.
- Connector/J 5.0 or newer.

Depending on your target installation/deployment environment you may also require:

- JBoss - 4.0rc1 or newer
- Apache Tomcat - 5.0 or newer
- Sun's JMX reference implementation version 1.2.1 (from <http://java.sun.com/products/JavaManagement/>)

24.5.2.1. Supported Platforms

Connector/MXJ is compatible with any platform supporting Java and MySQL. By default, Connector/MXJ incorporates the `mysqld` binary for a select number of platforms, as outlined below.

- Linux, i386
- Windows NT, Windows 2000, Windows XP, x86
- Solaris 8, SPARC 32 (compatible with Solaris 8, Solaris 9 and Solaris 10 on SPARC 32-bit and 64-bit platforms)
- Mac OS X, PowerPC

For more information on packaging your own Connector/MXJ with the platforms you require, see [Section 24.5.5.1, “Creating your own Connector/MXJ Package”](#)

24.5.2.2. Connector/MXJ Base Installation

Because there is no formal installation process, the method, installation directory, and access methods you use for Connector/MXJ are entirely up to your individual requirements.

To perform a basic installation, choose a target directory for the files included in the Connector/MXJ package. On Unix/Linux systems you may opt to use a directory such as `/usr/local/connector-mxj`; On Windows, you may want to install the files in the base directory, `C:\Connector-MXJ`, or within the [Program Files](#) directory.

To install the files, for a Connector/MXJ 5.0.4 installation:

1. Download the Connector/MXJ package, either in Tar/Gzip format (ideal for Unix/Linux systems) or Zip format (Windows).
2. Extract the files from the package. This will create a directory `connector-mxj`. Copy and optionally rename this directory to your desired location.
3. For best results, you should update your global `CLASSPATH` variable with the location of the required `jar` files.

Within Unix/Linux you can do this globally by editing the global shell profile, or on a user by user basis by editing their individual shell profile.

On Windows 2000, Windows NT and Windows XP, you can edit the global `CLASSPATH` by editing the [Environment Variables](#) configured through the [System](#) control panel.

For Connector/MXJ 5.0.4 and later you need the following JAR files in your `CLASSPATH`

1. `connector-mxj.jar` — contains the main Connector/MXJ classes.
2. `connector-mxj-db-files.jar` — contains the embedded `mysqld` and database files.
3. `aspectjrt.jar` — the AspectJ runtime library, located in `lib/aspectjrt.jar` in the Connector/MXJ package.
4. `connector-j.jar` — Connector/J, see [Section 24.4, “MySQL Connector/J”](#).

For Connector/MXJ 5.0.3 and earlier, you need the following JAR files:

1. `connector-mxj.jar`
2. `aspectjrt.jar` — the AspectJ runtime library, located in `lib/aspectjrt.jar` in the Connector/MXJ package.
3. `connector-j.jar` — Connector/J, see [Section 24.4, “MySQL Connector/J”](#).

24.5.2.3. Connector/MXJ Quick Start Guide

Once you have extracted the Connector/MXJ and Connector/J components you can run one of the sample applications that initiates a MySQL instance. You can test the installation by running the `ConnectorMXJUrlTestExample`:

```
java ConnectorMXJUrlTestExample
jdbc:mysql:mxj://localhost:3336/test?serverbasedir=/var/tmp/test-mxj
[MySqlResource] launching mysqld (getOptions)
[/var/tmp/test-mxj/bin/mysqld][--no-defaults] »
[--pid-file=/var/tmp/test-mxj/data/MySqlResource.pid] »
[--socket=mysql.sock][--datadir=/var/tmp/test-mxj/data] »
[--port=3336][--basedir=/var/tmp/test-mxj]
[MySqlResource] launching mysqld (driver_launched_mysqld_1)
InnoDB: The first specified data file ./ibdata1 did not exist:
```

```

InnoDB: a new database to be created!
060726 15:40:42 InnoDB: Setting file ./ibdata1 size to 10 MB
InnoDB: Database physically writes the file full: wait...
060726 15:40:43 InnoDB: Log file ./ib_logfile0 did not exist: new to be created
InnoDB: Setting log file ./ib_logfile0 size to 5 MB
InnoDB: Database physically writes the file full: wait...
060726 15:40:43 InnoDB: Log file ./ib_logfile1 did not exist: new to be created
InnoDB: Setting log file ./ib_logfile1 size to 5 MB
InnoDB: Database physically writes the file full: wait...
InnoDB: Doublewrite buffer not found: creating new
InnoDB: Doublewrite buffer created
InnoDB: Creating foreign key constraint system tables
InnoDB: Foreign key constraint system tables created
060726 15:40:44 InnoDB: Started; log sequence number 0 0
060726 15:40:44 [Note] /var/tmp/test-mxj/bin/mysqld: ready for connections.
Version: '5.0.22-max' socket: 'mysql.sock' port: 3336 MySQL Community Edition - Experimental (GPL)
[MysqldResource] mysqld running as process: 1210
-----

5.0.22-max

-----

[MysqldResource] stopping mysqld (process: 1210)
060726 15:40:44 [Note] /var/tmp/test-mxj/bin/mysqld: Normal shutdown

060726 15:40:45 InnoDB: Starting shutdown...
060726 15:40:48 InnoDB: Shutdown completed; log sequence number 0 43655
060726 15:40:48 [Note] /var/tmp/test-mxj/bin/mysqld: Shutdown complete

[MysqldResource] clearing options
[MysqldResource] shutdown complete

```

The above output shows an instance of MySQL starting, the necessary files being created (log files, InnoDB data files) and the MySQL database entering the running state. The instance is then shutdown by Connector/MXJ before the example terminates.

24.5.2.4. Deploying Connector/MXJ using Driver Launch

Connector/MXJ and Connector/J work together to enable you to launch an instance of the `mysqld` server through the use of a keyword in the JDBC connection string. Deploying Connector/MXJ within a Java application can be automated through this method, making the deployment of Connector/MXJ a simple process:

1. Download and unzip Connector/MXJ, add `connector-mxj.jar` to the `CLASSPATH`.
If you are using Connector/MXJ v5.0.4 or later you will also need to add the `connector-mxj-db-files.jar` file to your `CLASSPATH`.
2. To the JDBC connection string, embed the `mxj` keyword, for example: `jdbc:mysql:mxj://localhost:PORT/DB-NAME`.

For more details, see [Section 24.5.3, "Connector/MXJ Configuration"](#).

24.5.2.5. Deploying Connector/MXJ within JBoss

For deployment within a JBoss environment, you must configure the JBoss environment to use the Connector/MXJ component within the JDBC parameters:

1. Download Connector/MXJ and copy the `connector-mxj.jar` file to the `$JBOSS_HOME/server/default/lib` directory.
If you are using Connector/MXJ v5.0.4 or later you will also need to copy the `connector-mxj-db-files.jar` file to `$JBOSS_HOME/server/default/lib`.
2. Download Connector/J and copy the `mysql-connector-java-5.0.4-bin.jar` file to the `$JBOSS_HOME/server/default/lib` directory.
3. Create an MBean service xml file in the `$JBOSS_HOME/server/default/deploy` directory with any attributes set, for instance the `datadir` and `autostart`.
4. Set the JDBC parameters of your web application to use:

```

String driver = "com.mysql.jdbc.Driver";
String url = "jdbc:mysql:///test?propertiesTransform="+
            "com.mysql.management.jmx.ConnectorMXJPropertiesTransform";
String user = "root";
String password = "";
Class.forName(driver);
Connection conn = DriverManager.getConnection(url, user, password);

```

You may wish to create a separate users and database table spaces for each application, rather than using "root and test".

We highly suggest having a routine backup procedure for backing up the database files in the `datadir`.

24.5.2.6. Verifying Installation using JUnit

The best way to ensure that your platform is supported is to run the JUnit tests. These will test the Connector/MXJ classes and the associated components.

24.5.2.6.1. JUnit Test Requirements

The first thing to do is make sure that the components will work on the platform. The `MysqlResource` class is really a wrapper for a native version of MySQL, so not all platforms are supported. At the time of this writing, Linux on the i386 architecture has been tested and seems to work quite well, as does OS X v10.3. There has been limited testing on Windows and Solaris.

Requirements:

1. JDK-1.4 or newer (or the JRE if you aren't going to be compiling the source or JSPs).
2. MySQL Connector/J version 5.0 or newer (from <http://dev.mysql.com/downloads/connector/j/>) installed and available via your CLASSPATH.
3. The `javax.management` classes for JMX version 1.2.1, these are present in the following application servers:
 - JBoss - 4.0rc1 or newer.
 - Apache Tomcat - 5.0 or newer.
 - Sun's JMX reference implementation version 1.2.1 (from <http://java.sun.com/products/JavaManagement/>).
4. JUnit 3.8.1 (from <http://www.junit.org/>).

If building from source, All of the requirements from above, plus:

1. Ant version 1.5 or newer (download from <http://ant.apache.org/>).

24.5.2.6.2. Running the JUnit Tests

1. The tests attempt to launch MySQL on the port 3336. If you have a MySQL running, it may conflict, but this isn't very likely because the default port for MySQL is 3306. However, You may set the "c-mxj_test_port" Java property to a port of your choosing. Alternatively, you may wish to start by shutting down any instances of MySQL you have running on the target machine.

The tests suppress output to the console by default. For verbose output, you may set the "c-mxj_test_silent" Java property to "false".

2. To run the JUnit test suite, the \$CLASSPATH must include the following:
 - JUnit
 - JMX
 - Connector/J
 - MySQL Connector/MXJ
3. If `connector-mxj.jar` is not present in your download, unzip MySQL Connector/MXJ source archive.

```
cd mysql djmx
ant dist
```

Then add `$TEMP/cmj/stage/connector-mxj/connector-mxj.jar` to the CLASSPATH.

4. if you have [junit](#), execute the unit tests. From the command line, type:

```
java junit.textui.TestRunner com.mysql.management.AllTestsSuite
```

The output should look something like this:

```
.....
.....
Time: 259.438
OK (101 tests)
```

Note that the tests are a bit slow near the end, so please be patient.

24.5.3. Connector/MXJ Configuration

24.5.3.1. Running as part of the JDBC Driver

A feature of the MySQL Connector/J JDBC driver is the ability to specify a connection to an embedded Connector/MXJ instance through the use of the `mxj` keyword in the JDBC connection string.

In the following example, we have a program which creates a connection, executes a query, and prints the result to the `System.out`. The MySQL database will be deployed and started as part of the connection process, and shutdown as part of the finally block.

You can find this file in the Connector/MXJ package as [src/ConnectorMXJUrlTestExample.java](#).

```
import java.io.File;
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.ResultSet;
import java.sql.Statement;

import com.mysql.management.driverlaunched.ServerLauncherSocketFactory;

public class ConnectorMXJUrlTestExample {
    public static String DRIVER = "com.mysql.jdbc.Driver";

    public static String JAVA_IO_TMPDIR = "java.io.tmpdir";

    public static void main(String[] args) throws Exception {
        File ourAppDir = new File(System.getProperty(JAVA_IO_TMPDIR));
        File databaseDir = new File(ourAppDir, "test-mxj");
        int port = 3336;

        String url = "jdbc:mysql:mxj://localhost:" + port + "/test" + "?"
            + "serverbasedir=" + databaseDir;

        System.out.println(url);

        String userName = "root";
        String password = "";

        Class.forName(DRIVER);
        Connection conn = null;
        try {
            conn = DriverManager.getConnection(url, userName, password);
            printQueryResults(conn, "SELECT VERSION()");
        } finally {
            try {
                if (conn != null)
                    conn.close();
            } catch (Exception e) {
                e.printStackTrace();
            }

            ServerLauncherSocketFactory.shutdown(databaseDir, null);
        }
    }

    public static void printQueryResults(Connection conn, String SQLquery)
        throws Exception {
        Statement stmt = conn.createStatement();
        ResultSet rs = stmt.executeQuery(SQLquery);
        int columns = rs.getMetaData().getColumnCount();
        System.out.println("-----");
        System.out.println();
        while (rs.next()) {
            for (int i = 1; i <= columns; i++) {
                System.out.println(rs.getString(i));
            }
            System.out.println();
        }
    }
}
```

```

rs.close();
stmt.close();
System.out.println("-----");
System.out.flush();
Thread.sleep(100); // wait for System.out to finish flush
}
}

```

To run the above program, be sure to have connector-mxj.jar and Connector/J in the CLASSPATH. Then type:

```
java ConnectorMXJTestExample
```

24.5.3.2. Running within a Java Object

If you have a java application and wish to “embed” a MySQL database, make use of the `com.mysql.management.MysqldResource` class directly. This class may be instantiated with the default (no argument) constructor, or by passing in a `java.io.File` object representing the directory you wish the server to be “unzipped” into. It may also be instantiated with `PrintStream` for “stdout” and “stderr” for logging.

Once instantiated, a `java.util.Map`, the object will be able to provide a `java.util.Map` of server options appropriate for the platform and version of MySQL which you will be using.

The `MysqldResource` enables you to “start” MySQL with a `java.util.Map` of server options which you provide, as well as “shut-down” the database. The following example shows a simplistic way to embed MySQL in an application using plain java objects.

You can find this file in the Connector/MXJ package as [src/ConnectorMXJObjectTestExample.java](#).

```

import java.io.File;
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.ResultSet;
import java.sql.Statement;
import java.util.HashMap;
import java.util.Map;

import com.mysql.management.MysqldResource;

public class ConnectorMXJObjectTestExample {
    public static String DRIVER = "com.mysql.jdbc.Driver";

    public static String JAVA_IO_TMPDIR = "java.io.tmpdir";

    public static void main(String[] args) throws Exception {
        File ourAppDir = new File(System.getProperty(JAVA_IO_TMPDIR));
        File databaseDir = new File(ourAppDir, "mysql-mxj");
        int port = 3336;

        MysqldResource mysqldResource = startDatabase(databaseDir, port);

        String userName = "root";
        String password = "";

        Class.forName(DRIVER);
        Connection conn = null;
        try {
            String url = "jdbc:mysql://localhost:" + port + "/test";
            conn = DriverManager.getConnection(url, userName, password);
            printQueryResults(conn, "SELECT VERSION()");
        } finally {
            try {
                if (conn != null) {
                    conn.close();
                }
            } catch (Exception e) {
                e.printStackTrace();
            }
            try {
                mysqldResource.shutdown();
            } catch (Exception e) {
                e.printStackTrace();
            }
        }
    }

    public static MysqldResource startDatabase(File databaseDir, int port) {
        MysqldResource mysqldResource = new MysqldResource(databaseDir);

        Map database_options = new HashMap();
        database_options.put("port", Integer.toString(port));
        mysqldResource.start("test-mysqld-thread", database_options);

        if (!mysqldResource.isRunning()) {
            throw new RuntimeException("MySQL did not start.");
        }

        System.out.println("MySQL is running.");
    }
}

```

```

    return mysqlResource;
}

public static void printQueryResults(Connection conn, String SQLquery)
    throws Exception {
    Statement stmt = conn.createStatement();
    ResultSet rs = stmt.executeQuery(SQLquery);
    int columns = rs.getMetaData().getColumnCount();
    System.out.println("-----");
    System.out.println();
    while (rs.next()) {
        for (int i = 1; i <= columns; i++) {
            System.out.println(rs.getString(i));
        }
        System.out.println();
    }
    rs.close();
    stmt.close();
    System.out.println("-----");
    System.out.flush();
    Thread.sleep(100); // wait for System.out to finish flush
}
}

```

24.5.3.3. Setting server options

Of course there are many options we may wish to set for a MySQL database. These options may be specified as part of the JDBC connection string simply by prefixing each server option with "server.". In the following example we set two driver parameters and two server parameters:

```

String url = "jdbc:mysql://" + hostColonPort + "/"
    + "?"
    + "cacheServerConfiguration=true"
    + "&"
    + "useLocalSessionState=true"
    + "&"
    + "server.basedir=/opt/myapp/db"
    + "&"
    + "server.datadir=/mnt/bigdisk/myapp/data";

```

24.5.4. Connector/MXJ Reference

24.5.4.1. MysqlResource API

24.5.4.1.1. MysqlResource Constructors

The `MysqlResource` class supports three different constructor forms:

- `public MysqlResource(File baseDir, File dataDir, String mysqlVersionString, PrintStream out, PrintStream err, Utils util)`

The most detailed constructor, enables you to set the base directory, data directory, select a server by its version string, standard out and standard error and MySQL utilities class.

- `public MysqlResource(File baseDir, File dataDir, String mysqlVersionString, PrintStream out, PrintStream err)`

Enables you to set the base directory, data directory, select a server by its version string, standard out and standard error.

- `public MysqlResource(File baseDir, File dataDir, String mysqlVersionString)`

Enables you to set the base directory, data directory and select a server by its version string. Output for standard out and standard err are directed to System.out and System.err.

- `public MysqlResource(File baseDir, File dataDir)`

Enables you to set the base directory and data directory. The default MySQL version is selected, and output for standard out and standard err are directed to System.out and System.err.

- `public MysqlResource(File baseDir);`

Allows the setting of the "basedir" to deploy the MySQL files to. Output for standard out and standard err are directed to System.out and System.err.

- `public MysqlResource();`

The basedir is defaulted to a subdirectory of the java.io.tmpdir. Output for standard out and standard err are directed to System.out and System.err;

24.5.4.1.2. MysqlResource Methods

MysqlResource API includes the following methods:

- `void start(String threadName, Map mysqlArgs);`

Deploys and starts MySQL. The "threadName" string is used to name the thread which actually performs the execution of the MySQL command line. The map is the set of arguments and their values to be passed to the command line.

- `void shutdown();`

Shuts down the MySQL instance managed by the MysqlResource object.

- `Map getServerOptions();`

Returns a map of all the options and their current (or default, if not running) options available for the MySQL database.

- `boolean isRunning();`

Returns true if the MySQL database is running.

- `boolean isReadyForConnections();`

Returns true once the database reports that is ready for connections.

- `void setKillDelay(int millis);`

The default "Kill Delay" is 30 seconds. This represents the amount of time to wait between the initial request to shutdown and issuing a "force kill" if the database has not shutdown by itself.

- `void addCompletionListenser(Runnable listener);`

Allows for applications to be notified when the server process completes. Each "listener" will be fired off in its own thread.

- `String getVersion();`

Returns the version of MySQL.

- `void setVersion(int MajorVersion, int minorVersion, int patchLevel);`

The standard distribution comes with only one version of MySQL packaged. However, it is possible to package multiple versions, and specify which version to use.

24.5.5. Connector/MXJ Notes and Tips

This section contains notes and tips on using the Connector/MXJ component within your applications.

24.5.5.1. Creating your own Connector/MXJ Package

If you want to create a custom Connector/MXJ package that includes a specific `mysql` version or platform then you must extract and rebuild the `connector-mxj.jar` (Connector/MXJ v5.0.3 or earlier) or `connector-mxj-db-files.jar` (Connector/MXJ v5.0.4 or later) file.

First, you should create a new directory into which you can extract the current `connector-mxj.jar`:

```
shell> mkdir custom-mxj
shell> cd custom-mxj
shell> jar -xf connector-mxj.jar
shell> ls
5-0-22/
ConnectorMXJObjectTestExample.class
ConnectorMXJUrlTestExample.class
META-INF/
TestDb.class
com/
kill.exe
```

If you are using Connector/MXJ v5.0.4 or later, you should unpack the `connector-mxj-db-files.jar`:

```
shell> mkdir custom-mxj
shell> cd custom-mxj
shell> jar -xf connector-mxj-db-files.jar
shell> ls
5-0-27/
META-INF/
connector-mxj.properties
```

The MySQL version directory, `5-0-22` or `5-0-27` in the preceding examples, contains all of the files used to create an instance of MySQL when Connector/MXJ is executed. All of the files in this directory are required for each version of MySQL that you want to embed. Note as well the format of the version number, which uses hyphens instead of periods to separate the version number components.

Within the version specific directory are the platform specific directories, and archives of the `data` and `share` directory required by MySQL for the various platforms. For example, here is the listing for the default Connector/MXJ package:

```
shell>> ls
Linux-i386/
META-INF/
Mac_OS_X-ppc/
SunOS-sparc/
Win-x86/
com/
data_dir.jar
share_dir.jar
win_share_dir.jar
```

Platform specific directories are listed by their OS and platform - for example the `mysqld` for Mac OS X PowerPC is located within the `Mac_OS_X-ppc` directory. You can delete directories from this location that you do not require, and add new directories for additional platforms that you want to support.

To add a platform specific `mysqld`, create a new directory with the corresponding name for your operating system/platform. For example, you could add a directory for Mac OS X/Intel using the directory `Mac_OS_X-i386`.

On Unix systems, you can determine the platform using `uname`:

```
shell> uname -p
i386
```

Now you need to download or compile `mysqld` for the MySQL version and platform you want to include in your custom `connector-mxj.jar` package into the new directory.

Create a file called `version.txt` in the OS/platform directory you have just created that contains the version string/path of the `mysqld` binary. For example:

```
mysql-5.0.22-osx10.3-i386/bin/mysqld
```

You can now recreate the `connector-mxj.jar` file with the added `mysqld`:

```
shell> cd custom-mxj
shell> jar -cf ../connector-mxj.jar *
```

For Connector/MXJ v5.0.4 and later, you should repackage to the `connector-mxj-db-files.jar`:

```
shell> cd custom-mxj
shell> jar -cf ../connector-mxj-db-files.jar *
```

You should test this package using the steps outlined in [Section 24.5.2.3, "Connector/MXJ Quick Start Guide"](#).

Note

Because the `connector-mxj-db-files.jar` file is separate from the main Connector/MXJ classes you can distribute different `connector-mxj-db-files.jar` files to different hosts or for different projects without having to create a completely new main `connector-mxj.jar` file for each one.

24.5.5.2. Deploying Connector/MXJ with a pre-configured database

To include a pre-configured/populated database within your Connector/MXJ JAR file you must create a custom `data_dir.jar` file, as included within the main `connector-mxj.jar` (Connector/MXJ 5.0.3 or earlier) or `connector-mxj-db-files.jar` (Connector/MXJ 5.0.4 or later) file:

1. First extract the `connector-mxj.jar` file, as outlined in the previous section (see [Section 24.5.5.1, "Creating your own Connector/MXJ Package"](#)).
2. First, create your database and populate the database with the information you require in an existing instance of MySQL - including Connector/MXJ instances. Data file formats are compatible across platforms.
3. Shutdown the instance of MySQL.
4. Create a JAR file of the data directory and databases that you want to include your Connector/MXJ package. You should include the `mysql` database, which includes user authentication information, in addition to the specific databases you want to include. For example, to create a JAR of the `mysql` and `mxjtest` databases:

```
shell> jar -cf ../data_dir.jar mysql mxjtest
```

5. For Connector/MXJ 5.0.3 or earlier, copy the `data_dir.jar` file into the extracted `connector-mxj.jar` directory, and then create an archive for `connector-mxj.jar`.

For Connector/MXJ 5.0.4 or later, copy the `data_dir.jar` file into the extracted `connector-mxj-db-files.jar` directory, and then create an archive for `connector-mxj-db-files.jar`.

Note that if you are create databases using the InnoDB engine, you must include the `ibdata.*` and `ib_logfile*` files within the `data_dir.jar` archive.

24.5.5.3. Running within a JMX Agent (custom)

As a JMX MBean, MySQL Connector/MXJ requires a JMX v1.2 compliant MBean container, such as JBoss version 4. The MBean will use the standard JMX management APIs to present (and allow the setting of) parameters which are appropriate for that platform.

If you are not using the SUN Reference implementation of the JMX libraries, you should skip this section. Or, if you are deploying to JBoss, you also may wish to skip to the next section.

We want to see the `MysqldDynamicMBean` in action inside of a JMX agent. In the `com.mysql.management.jmx.sunri` package is a custom JMX agent with two MBeans:

1. the `MysqldDynamicMBean`, and
2. a `com.sun.jdmk.comm.HtmlAdaptorServer`, which provides a web interface for manipulating the beans inside of a JMX agent.

When this very simple agent is started, it will allow a MySQL database to be started and stopped with a web browser.

1. Complete the testing of the platform as above.
 - current JDK, JUnit, Connector/J, MySQL Connector/MXJ
 - this section *requires* the SUN reference implementation of JMX
 - `PATH`, `JAVA_HOME`, `ANT_HOME`, `CLASSPATH`

2. If not building from source, skip to next step

rebuild with the "sunri.present"

```
ant -Dsunri.present=true dist
re-run tests:
java junit.textui.TestRunner com.mysql.management.AllTestsSuite
```

3. launch the test agent from the command line:

```
java com.mysql.management.jmx.sunri.MysqldTestAgentSunHtmlAdaptor &
```

4. from a browser:

```
http://localhost:9092/
```

5. under MysqlAgent,

```
select "name=mysqlid"
```

6. Observe the MBean View
7. scroll to the bottom of the screen press the STARTMYSQLD button
8. click [Back to MBean View](#)
9. scroll to the bottom of the screen press STOPMYSQLD button
10. kill the java process running the Test Agent (jmx server)

24.5.5.4. Deployment in a standard JMX Agent environment (JBoss)

Once there is confidence that the MBean will function on the platform, deploying the MBean inside of a standard JMX Agent is the next step. Included are instructions for deploying to JBoss.

1. Ensure a current version of java development kit (v1.4.x), see above.
 - Ensure `JAVA_HOME` is set (JBoss requires `JAVA_HOME`)
 - Ensure `JAVA_HOME/bin` is in the `PATH` (You will NOT need to set your `CLASSPATH`, nor will you need any of the jars used in the previous tests).
2. Ensure a current version of JBoss (v4.0RC1 or better)

```
http://www.jboss.org/index.html
select "Downloads"
select "jboss-4.0.zip"
pick a mirror
unzip ~/dload/jboss-4.0.zip
create a JBOSS_HOME environment variable set to the unzipped directory
unix only:
cd $JBOSS_HOME/bin
chmod +x *.sh
```

3. Deploy (copy) the `connector-mxj.jar` to `$JBOSS_HOME/server/default/lib`.
4. Deploy (copy) `mysql-connector-java-3.1.4-beta-bin.jar` to `$JBOSS_HOME/server/default/lib`.
5. Create a `mxjtest.war` directory in `$JBOSS_HOME/server/default/deploy`.
6. Deploy (copy) `index.jsp` to `$JBOSS_HOME/server/default/deploy/mxjtest.war`.
7. Create a `mysqlid-service.xml` file in `$JBOSS_HOME/server/default/deploy`.

```
<?xml version="1.0" encoding="UTF-8"?>
<server>
  <mbean code="com.mysql.management.jmx.jboss.JBossMysqlidDynamicMBean"
    name="mysql:type=service,name=mysqlid">
    <attribute name="datadir">/tmp/xxx_data_xxx</attribute>
    <attribute name="autostart">true</attribute>
  </mbean>
</server>
```

8. Start jboss:
 - on unix: `$JBOSS_HOME/bin/run.sh`
 - on windows: `%JBOSS_HOME%\bin\run.bat`

Be ready: JBoss sends a lot of output to the screen.

9. When JBoss seems to have stopped sending output to the screen, open a web browser to: <http://localhost:8080/jmx-console>
10. Scroll down to the bottom of the page in the `mysql` section, select the bulleted `mysqlid` link.
11. Observe the JMX MBean View page. MySQL should already be running.

12. (If "autostart=true" was set, you may skip this step.) Scroll to the bottom of the screen. You may press the INVOKE button to stop (or start) MySQL observe `Operation completed successfully without a return value`. Click `Back to MBean View`
13. To confirm MySQL is running, open a web browser to `http://localhost:8080/mxjtest/` and you should see that

```
SELECT 1
```

returned with a result of

```
1
```

14. Guided by the `$JBOSS_HOME/server/default/deploy/mxjtest.war/index.jsp` you will be able to use MySQL in your Web Application. There is a `test` database and a `root` user (no password) ready to experiment with. Try creating a table, inserting some rows, and doing some selects.
15. Shut down MySQL. MySQL will be stopped automatically when JBoss is stopped, or: from the browser, scroll down to the bottom of the MBean View press the stop service INVOKE button to halt the service. Observe `Operation completed successfully without a return value`. Using `ps` or `task manager` see that MySQL is no longer running

As of 1.0.6-beta version is the ability to have the MBean start the MySQL database upon start up. Also, we've taken advantage of the JBoss life-cycle extension methods so that the database will gracefully shut down when JBoss is shutdown.

24.5.6. Connector/MXJ Support

There are a wide variety of options available for obtaining support for using Connector/MXJ. You should contact the Connector/MXJ community for help before reporting a potential bug or problem. See [Section 24.5.6.1, "Connector/MXJ Community Support"](#).

24.5.6.1. Connector/MXJ Community Support

MySQL AB provides assistance to the user community by means of a number of mailing lists and web based forums.

You can find help and support through the [MySQL and Java](#) mailing list.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See [Section 1.7.1, "MySQL Mailing Lists"](#).

Community support from experienced users is also available through the [MyODBC Forum](#). You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See [Section 1.7.2, "MySQL Community Support at the MySQL Forums"](#).

24.5.6.2. How to Report Connector/MXJ Problems

If you encounter difficulties or problems with Connector/MXJ, contact the Connector/MXJ community [Section 24.5.6.1, "Connector/MXJ Community Support"](#).

If reporting a problem, you should ideally include the following information with the email:

- Operating system and version
- Connector/MXJ version
- MySQL server version
- Copies of error messages or other unexpected output
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

If you believe the problem to be a bug, then you must report the bug through <http://bugs.mysql.com/>.

24.5.6.3. Connector/MXJ Change History

The Connector/MXJ Change History (Changelog) is located with the main Changelog for MySQL. See [Section E.7, "MySQL Con-](#)

[nector/MXJ Change History](#)".

24.6. Connector/PHP

The PHP distribution and documentation are available from the PHP Web site. MySQL provides the `mysql` and `mysql_i` extensions for the Windows operating system on <http://dev.mysql.com/downloads/connector/php/> for MySQL version 4.1.16 and higher, MySQL 5.0.18, and MySQL 5.1. You can find information why you should preferably use the extensions provided by MySQL on that page. For platforms other than Windows, you should use the `mysql` or `mysql_i` extensions shipped with the PHP sources. See [Section 23.3, "MySQL PHP API"](#).

Chapter 25. MySQL Proxy

The MySQL Proxy is an application that communicates over the network using the MySQL Network Protocol and provides communication between one or more MySQL servers and one or more MySQL clients. In the most basic configuration, MySQL Proxy simply passes on queries from the client to the MySQL Server and returns the responses from the MySQL Server to the client.

Because MySQL Proxy uses the MySQL network protocol, any MySQL compatible client (include the command line client, any clients using the MySQL client libraries, and any connector that supports the MySQL network protocol) can connect to the proxy without modification.

In addition to the basic pass-through configuration, the MySQL Proxy is also capable of monitoring and altering the communication between the client and the server. This interception of the queries enables you to add profiling. The interception of the exchanges is scriptable using the Lua scripting language.

By intercepting the queries from the client, the proxy can insert additional queries into the list of queries sent to the server, and remove the additional results when they are returned by the server. Using this functionality you can add informational statements to each query, for example to monitor their execution time or progress, and separately log the results, while still returning the results from the original query to the client.

The proxy allows you to perform additional monitoring, filtering or manipulation on queries without you having to make any modifications to the client and without the client even being aware that it is communicating with anything but a genuine MySQL server.

Warning

MySQL Proxy is currently an Alpha release and should not be used within production environments.

Important

MySQL Proxy is compatible with MySQL 5.0.x or later. Testing has not been performed with Version 4.1. Please provide feedback on your experiences via the [MySQL Proxy Forum](#).

25.1. MySQL Proxy Supported Platforms

MySQL Proxy is currently available as a pre-compiled binary for the following platforms:

- Linux (including RedHat, Fedora, Debian, SuSE) and derivatives.
- Mac OS X
- FreeBSD
- IBM AIX
- Sun Solaris

Other Unix/Linux platforms not listed should be compatible by using the source package and building MySQL Proxy locally.

System requirements for the MySQL Proxy application are the same as the main MySQL server. Currently MySQL Proxy is compatible only with MySQL 5.0.1 and later. MySQL Proxy is provided as a standalone, statically linked binary. You do not need to have MySQL or Lua installed.

25.2. Installing MySQL Proxy

You have three choices for installing MySQL Proxy:

- Pre-compiled binaries are available for a number of different platforms. See [Section 25.2.1, “Installing MySQL Proxy from a binary distribution”](#).
- You can install from the source code if you want to build on an environment not supported by the binary distributions. See [Section 25.2.2, “Installing MySQL Proxy from a source distribution”](#).
- The latest version of the MySQL proxy source code is available through a development repository is the best way to stay up to date with the latest fixes and revisions. See [Section 25.2.3, “Installing MySQL Proxy from the Subversion repository”](#).

25.2.1. Installing MySQL Proxy from a binary distribution

If you download the binary packages then you need only to extract the package and then copy the `mysql-proxy` file to your desired location. For example:

```
$ tar zxf mysql-proxy-0.5.0.tar.gz
$ cp ./mysql-proxy-0.5.0/sbin/mysql-proxy /usr/local/sbin
```

25.2.2. Installing MySQL Proxy from a source distribution

If you have downloaded the source package then you will need to compile the MySQL Proxy before using it. To build you will need to have the following installed:

- libevent 1.x or higher (1.3b or later is preferred)
- lua 5.1.x or higher
- glib2 2.6.0 or higher
- pkg-config
- MySQL 5.0.x or higher developer files

Once these components are installed, you need to configure and then build:

```
$ tar zxf mysql-proxy-0.5.0.tar.gz
$ cd mysql-proxy-0.5.0
$ ./configure
$ make
```

If you want to test the build, then use the `check` target to `make`:

```
$ make check
```

The tests try to connect to `localhost` using the `root` user. If you need to provide a password, set the `MYSQL_PASSWORD` environment variable:

```
$ MYSQL_PASSWORD=root_pwd make check
```

You can install using the `install` target:

```
$ make install
```

By default `mysql-proxy` is installed into `/usr/local/sbin/mysql-proxy`. The Lua example scripts are copied into `/usr/local/share`.

25.2.3. Installing MySQL Proxy from the Subversion repository

The MySQL Proxy source is available through a public Subversion repository and is the quickest way to get hold of the latest releases and fixes.

To build from the Subversion repository, you need the following components already installed:

- Subversion 1.3.0 or higher
- `libtool` 1.5 or higher
- `autoconf` 2.56 or higher
- `automake` 1.9 or higher
- `libevent` 1.x or higher (1.3b or later is preferred)
- `lua` 5.1.x or higher
- `glib2` 2.4.0 or higher

- `pkg-config`
- MySQL 5.0.x or higher developer files

To checkout a local copy of the Subversion repository, use `svn`:

```
$ svn co http://svn.MySQL.com/svnpublic/mysql-proxy/ mysql-proxy
```

The above command will download a complete version of the Subversion repository for `mysql-proxy`. The main source files are located within the `trunk` subdirectory. The configuration scripts need to be generated before you can configure and build `mysql-proxy`. The `autogen.sh` script will generate the configuration scripts for you:

```
$ sh ./autogen.sh
```

The script creates the standard `configure` script, which you can then use to configure and build with `make`:

```
$ ./configure
$ make
$ make install
```

If you want to create a standalone source distribution, identical to the source distribution available for download:

```
$ make distcheck
```

The above will create the file `mysql-proxy-0.5.0.tar.gz` within the current directory.

25.3. MySQL Proxy Command Line Options

To start `mysql-proxy` you can just run the command directly. However, for most situations you will want to specify at the very least the address/hostname and port number of the backend MySQL server to which the MySQL Proxy should pass on queries.

You can get a list of the supported command-line options using the `--help-all` command line option. The majority of these options set up the environment, either in terms of the address/port number that `mysql-proxy` should listen on for connections, or the onward connection to a MySQL server. A full description of the options is shown below:

- `--help-all` — show all help options.
- `--help-admin` — show options for the admin-module.
- `--help-proxy` — Show options for the proxy-module.
- `--admin-address=host:port` — specify the hostname (or IP address) and port for the administration port. The default is `localhost:4041`.
- `--proxy-address=host:port` — the listening hostname (or IP address) and port of the proxy server. The default is `localhost:4040`.
- `--proxy-read-only-address=host:port` — the listening hostname (or IP address) and port of the proxy server for read-only connections. The default is `localhost:4042`.
- `--proxy-backend-addresses=host:port` — the hostname (or IP address) and port of the MySQL server to connect to. You can specify multiple backend servers by supplying multiple options. Clients are connected to each backend server in round-robin fashion. For example, if you specify two servers A and B, the first client connection will go to server A; the second client connection to server B and the third client connection to server A.
- `--proxy-skip-profiling` — disables profiling of queries (tracking time statistics). The default is for tracking to be enabled.
- `--proxy-fix-bug-25371` — gets round an issue when connecting to a MySQL server later than 5.1.12 when using a MySQL client library of any earlier version.
- `--proxy-lua-script=file` — specify the Lua script file to be loaded. Note that the script file is not physically loaded and parsed until a connection is made. Also note that the specified Lua script is reloaded for each connection; if the content of the Lua script changes while `mysql-proxy` is running then the updated content will automatically be used when a new connection is made.
- `--daemon` — starts the proxy in daemon mode.

- `--pid-file=file` — sets the name of the file to be used to store the process ID.
- `--version` — show the version number.

The most common usage is as a simple proxy service (i.e. without addition scripting). For basic proxy operation you must specify at least one `proxy-backend-addresses` option to specify the MySQL server to connect to by default:

```
$ mysql-proxy
--proxy-backend-addresses=MySQL.example.com:3306
```

The default proxy port is `4040`, so you can connect to your MySQL server through the proxy by specifying the hostname and port details:

```
$ mysql --host=localhost --port=4040
```

If your server requires authentication information then this will be passed through natively without alteration by `mysql-proxy`, so you must also specify the authentication information if required:

```
$ mysql --host=localhost --port=4040 \
--user=username --password=password
```

You can also connect to a read-only port (which filters out `UPDATE` and `INSERT` queries) by connecting to the read-only port. By default the hostname is the default, and the port is `4042`, but you can alter the host/port information by using the `--proxy-read-only-address` command line option.

For more detailed information on how to use these command line options, and `mysql-proxy` in general in combination with Lua scripts, see [Section 25.5, “Using MySQL Proxy”](#).

25.4. MySQL Proxy Scripting

You can control how MySQL Proxy manipulates and works with the queries and results that are passed on to the MySQL server through the use of the embedded Lua scripting language. You can find out more about the Lua programming language from the [Lua Website](#).

The primary interaction between MySQL Proxy and the server is provided by defining one or more functions through an Lua script. A number of functions are supported, according to different events and operations in the communication sequence between a client and one or more backend MySQL servers:

- `connect_server()` — this function is called each time a connection is made to MySQL Proxy from a client. You can use this function during load-balancing to intercept the original connection and decide which server the client should ultimately be attached to. If you don't define a special solution, then a simple round-robin style distribution is used by default.
- `read_handshake()` — this function is called when the initial handshake information is returned by the server. You can capture the handshake information returned and provide additional checks before the authorization exchange takes place.
- `read_auth()` — this function is called when the authorization packet (username, password, default database) are submitted by the client to the server for authentication.
- `read_auth_result()` — this function is called when the server returns an authorization packet to the client indicating whether the authorization succeeded.
- `read_query()` — this function is called each time a query is sent by the client to the server. You can use this to edit and manipulate the original query, including adding new queries before and after the original statement. You can also use this function to return information directly to the client, bypassing the server, which can be useful to filter unwanted queries or queries that exceed known limits.
- `read_query_result()` — this function is called each time a result is returned from the server, providing you have manually injected queries into the query queue. If you have not explicitly inject queries within the `read_query()` function then this function is not triggered. You can use this to edit the result set, or to remove or filter the result sets generated from additional queries you injected into the queue when using `read_query()`.

The table below describes the direction of flow of information at the point when the function is triggered.

Function	Supplied Information	Direction
<code>connect_server()</code>	None	Client to Server
<code>read_handshake()</code>	Handshake packet	Server to Client

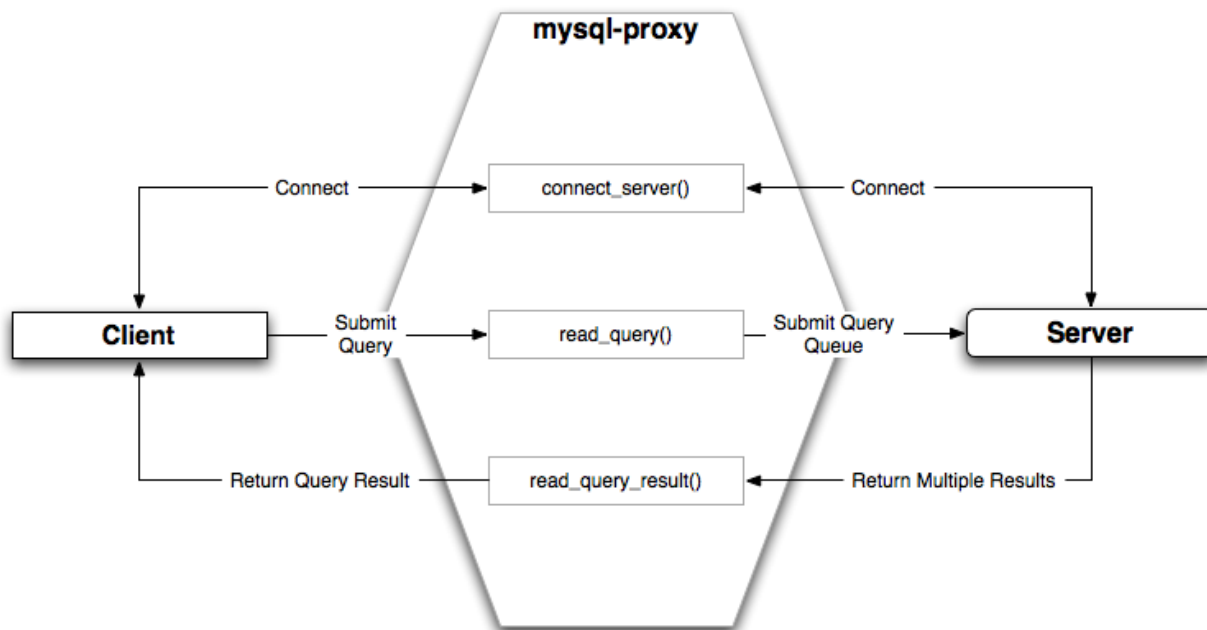

Function	Supplied Information	Direction
<code>read_auth()</code>	Authorization packet	Client to Server
<code>read_auth_result()</code>	Authorization response	Server to Client
<code>read_query()</code>	Query	Client to Server
<code>read_query_result()</code>	Query result	Server to Client

By default, all functions return a result that indicates that the data should be passed on to the client or server (depending on the direction of the information being transferred). This return value can be overridden by explicitly returning a constant indicating that a particular response should be sent. For example, it is possible to construct result set information by hand within `read_query()` and to return the resultset directly to the client without ever sending the original query to the server.

In addition to these functions, a number of built-in structures provide control over how MySQL Proxy forwards on queries and returns the results by providing a simplified interface to elements such as the list of queries and the groups of result sets that are returned.

25.4.1. Proxy Scripting Sequence During Query Injection

The figure below gives an example of how the proxy might be used when injecting queries into the query queue. Because the proxy sits between the client and MySQL server, what the proxy sends to the server, and the information that the proxy ultimately returns to the client do not have to match correlate. Once the client has connected to the proxy, the following sequence occurs for each individual query sent by the client.

1. The client submits one query to the proxy, the `read_query()` function within the proxy is triggered. The function adds the query to the query queue.
2. Once manipulation by `read_query()` has completed, the queries are submitted, sequentially, to the MySQL server.
3. The MySQL server returns the results from each query, one result set for each query submitted. The `read_query_result()` function is triggered for each result set, and each invocation can decide which result set to return to the client

For example, you can queue additional queries into the global query queue to be processed by the server. This can be used to add statistical information by adding queries before and after the original query, changing the original query:

```
SELECT * FROM City;
```

Into a sequence of queries:

```
SELECT NOW();
```

```
SELECT * FROM City;
SELECT NOW();
```

You can also modify the original statement, for example to add `EXPLAIN` to each statement executed to get information on how the statement was processed, again altering our original SQL statement into a number of statements:

```
SELECT * FROM City;
EXPLAIN SELECT * FROM City;
```

In both of these examples, the client would have received more result sets than expected. Regardless of how you manipulate the incoming query and the returned result, the number of queries returned by the proxy must match the number of original queries sent by the client.

You could adjust the client to handle the multiple result sets sent by the proxy, but in most cases you will want the existence of the proxy to remain transparent. To ensure that the number of queries and result sets match, you can use the MySQL Proxy `read_query_result()` to extract the additional result set information and return only the result set the client originally requested back to the client. You can achieve this by giving each query that you add to the query queue a unique ID, and then filter out queries that do not match the original query ID when processing them with `read_query_result()`.

25.4.2. Internal Structures

There are a number of internal structures within the scripting element of MySQL Proxy. The primary structure is `proxy` and this provides an interface to the many common structures used throughout the script, such as connection lists and configured backend servers. Other structures, such as the incoming packet from the client and result sets are only available within the context of one of the scriptable functions.

Attribute	Description
<code>connection</code>	A structure containing the active client connections. For a list of attributes, see <code>proxy.connection</code> .
<code>servers</code>	A structure containing the list of configured backend servers. For a list of attributes, see <code>proxy.servers</code> .
<code>queries</code>	A structure containing the queue of queries that will be sent to the server during a single client query. For a list of attributes, see <code>proxy.queries</code> .
<code>PROXY_VERSION</code>	The version number of MySQL Proxy, encoded in hex. You can use this to check that the version number supports a particular option from within the Lua script. Note that the value is encoded as a hex value, so to check the version is at least 0.5.1 you compare against <code>0x00501</code> .

`proxy.connection`

The `proxy.connection` object is read only, and provides information about the current connection.

Attribute	Description
<code>thread_id</code>	The thread ID of the connection.
<code>backend_ndx</code>	The ID of the server used for this connection. This is an ID valid against the list of configured servers available through the <code>proxy.servers</code> object.

`proxy.servers`

The `proxy.servers` table is partially writable and contains an array of all the configured backend servers and the server metadata (IP address, status, etc.). You can determine the array index of the current connection using `proxy.connection["backend_ndx"]` which is the index into this table of the backend server being used by the active connection.

The attributes for each entry within the `proxy.servers` table is shown in this table.

Attribute	Description
<code>address</code>	The hostname/port combination used for this connection
<code>connected_clients</code>	The number of clients currently connected.
<code>state</code>	The status of the backend server. See Section 25.4.2, “Internal Structures” [1460]

proxy.queries

The `proxy.queries` object is a queue representing the list of queries to be sent to the server. The queue is not populated automatically, but if you do not explicitly populate the queue then queries are passed on to the backend server verbatim. Also, if you do not populate the query queue by hand, then the `read_query_result()` function is not triggered.

The following methods are supported for populating the `proxy.queries` object.

Function	Description
<code>append(id,packet)</code>	Appends a query to the end of the query queue. The <code>id</code> is an integer identifier that you can use to recognize the query results when they are returned by the server. The packet should be a properly formatted query packet.
<code>prepend(id,packet)</code>	Prepends a query to the query queue. The <code>id</code> is an identifier that you can use to recognize the query results when they are returned by the server. The packet should be a properly formatted query packet.
<code>reset()</code>	Empties the query queue.
<code>len()</code>	Returns the number of query packets in the queue.

For example, you could append a query packet to the `proxy.queries` queue by using the `append()`:

```
proxy.queries:append(1,packet)
```

Proxy Return State Constants

The following constants are used internally by the proxy to specify the response to send to the client or server. All constants are exposed as values within the main `proxy` table.

Constant	Description
<code>PROXY_SEND_QUERY</code>	Causes the proxy to send the current contents of the queries queue to the server.
<code>PROXY_SEND_RESULT</code>	Causes the proxy to send a result set back to the client.
<code>PROXY_IGNORE_RESULT</code>	Causes the proxy to drop the result set (nothing is returned to the client).

As constants, these entities are available without qualification in the Lua scripts. For example, at the end of the `read_query_result()` you might return `PROXY_IGNORE_RESULT`:

```
return proxy.PROXY_IGNORE_RESULT
```

Packet State Constants

The following states describe the status of a network packet. These items are entries within the main `proxy` table.

Constant	Description
<code>MYSQLD_PACKET_OK</code>	The packet is OK.
<code>MYSQLD_PACKET_ERR</code>	The packet contains error information.
<code>MYSQLD_PACKET_RAW</code>	The packet contains raw data.

Backend State/Type Constants

The following constants are used either to define the status of the backend server (the MySQL server to which the proxy is connected) or the type of backend server. These items are entries within the main `proxy` table.

Constant	Description
<code>BACKEND_STATE_UNKNOWN</code>	The current status is unknown.
<code>BACKEND_STATE_UP</code>	The backend is known to be up (available).
<code>BACKEND_STATE_DOWN</code>	The backend is known to be down (unavailable).
<code>BACKEND_TYPE_UNKNOWN</code>	Backend type is unknown.
<code>BACKEND_TYPE_RW</code>	Backend is available for read/write.
<code>BACKEND_TYPE_RO</code>	Backend is available only for read-only use.

Server Command Constants

The following values are used in the packets exchanged between the client and server to identify the information in the rest of the packet. These items are entries within the main `proxy` table. The packet type is defined as the first character in the sent packet. For example, when intercepting packets from the client to edit or monitor a query you would check that the first byte of the packet was of type `proxy.COM_QUERY`.

Constant	Description
<code>COM_SLEEP</code>	Sleep
<code>COM_QUIT</code>	Quit
<code>COM_INIT_DB</code>	Initialize database
<code>COM_QUERY</code>	Query
<code>COM_FIELD_LIST</code>	Field List
<code>COM_CREATE_DB</code>	Create database
<code>COM_DROP_DB</code>	Drop database
<code>COM_REFRESH</code>	Refresh
<code>COM_SHUTDOWN</code>	Shutdown
<code>COM_STATISTICS</code>	Statistics
<code>COM_PROCESS_INFO</code>	Process List
<code>COM_CONNECT</code>	Connect
<code>COM_PROCESS_KILL</code>	Kill
<code>COM_DEBUG</code>	Debug
<code>COM_PING</code>	Ping
<code>COM_TIME</code>	Time
<code>COM_DELAYED_INSERT</code>	Delayed insert
<code>COM_CHANGE_USER</code>	Change user
<code>COM_BINLOG_DUMP</code>	Binlog dump
<code>COM_TABLE_DUMP</code>	Table dump
<code>COM_CONNECT_OUT</code>	Connect out
<code>COM_REGISTER_SLAVE</code>	Register slave
<code>COM_STMT_PREPARE</code>	Prepare server-side statement
<code>COM_STMT_EXECUTE</code>	Execute server-side statement
<code>COM_STMT_SEND_LONG_DATA</code>	Long data
<code>COM_STMT_CLOSE</code>	Close server-side statement
<code>COM_STMT_RESET</code>	Reset statement
<code>COM_SET_OPTION</code>	Set option
<code>COM_STMT_FETCH</code>	Fetch statement
<code>COM_DAEMON</code>	Daemon (MySQL 5.1 only)
<code>COM_ERROR</code>	Error

MySQL Type Constants

These constants are used to identify the field types in the query result data returned to clients from the result of a query. These items are entries within the main `proxy` table.

Constant	Field Type
<code>MYSQL_TYPE_DECIMAL</code>	Decimal
<code>MYSQL_TYPE_NEWDECIMAL</code>	Decimal (MySQL 5.0 or later)
<code>MYSQL_TYPE_TINY</code>	Tiny
<code>MYSQL_TYPE_SHORT</code>	Short
<code>MYSQL_TYPE_LONG</code>	Long
<code>MYSQL_TYPE_FLOAT</code>	Float

Constant	Field Type
<code>MYSQL_TYPE_DOUBLE</code>	Double
<code>MYSQL_TYPE_NULL</code>	Null
<code>MYSQL_TYPE_TIMESTAMP</code>	Timestamp
<code>MYSQL_TYPE_LONGLONG</code>	Long long
<code>MYSQL_TYPE_INT24</code>	Integer
<code>MYSQL_TYPE_DATE</code>	Date
<code>MYSQL_TYPE_TIME</code>	Time
<code>MYSQL_TYPE_DATETIME</code>	Datetime
<code>MYSQL_TYPE_YEAR</code>	Year
<code>MYSQL_TYPE_NEWDATE</code>	Date (MySQL 5.0 or later)
<code>MYSQL_TYPE_ENUM</code>	Enumeration
<code>MYSQL_TYPE_SET</code>	Set
<code>MYSQL_TYPE_TINY_BLOB</code>	Tiny Blob
<code>MYSQL_TYPE_MEDIUM_BLOB</code>	Medium Blob
<code>MYSQL_TYPE_LONG_BLOB</code>	Long Blob
<code>MYSQL_TYPE_BLOB</code>	Blob
<code>MYSQL_TYPE_VAR_STRING</code>	Varstring
<code>MYSQL_TYPE_STRING</code>	String
<code>MYSQL_TYPE_TINY</code>	Tiny (compatible with <code>MYSQL_TYPE_CHAR</code>)
<code>MYSQL_TYPE_ENUM</code>	Enumeration (compatible with <code>MYSQL_TYPE_INTERVAL</code>)
<code>MYSQL_TYPE_GEOMETRY</code>	Geometry
<code>MYSQL_TYPE_BIT</code>	Bit

25.4.3. Capturing a connection with `connect_server()`

When the proxy accepts a connection from a MySQL client, the `connect_server()` function is called.

There are no arguments to the function, but you can use and if necessary manipulate the information in the `proxy.connection` table, which is unique to each client session.

For example, if you have multiple backend servers then you can set the server to be used by that connection by setting the value of `proxy.connection.backend_ndx` to a valid server number. The code below will choose between two servers based on whether the current time in minutes is odd or even:

```
function connect_server()
    print("--> a client really wants to talk to a server")
    if (tonumber(os.date("%M")) % 2 == 0) then
        proxy.connection.backend_ndx = 2
        print("Choosing backend 2")
    else
        proxy.connection.backend_ndx = 1
        print("Choosing backend 1")
    end
    print("Using " .. proxy.servers[proxy.connection.backend_ndx].address)
end
```

In this example the IP address/port combination is also displayed by accessing the information from the internal `proxy.servers` table.

25.4.4. Examining the handshake with `read_handshake()`

Handshake information is sent by the server to the client after the initial connection (through `connect_server()`) has been made. The handshake information contains details about the MySQL version, the ID of the thread that will handle the connection information, and the IP address of the client and server. This information is exposed through a Lua table as the only argument to the function.

- `mysqld_version` — the version of the MySQL server.

- `thread_id` — the thread ID.
- `scramble` — the password scramble buffer.
- `server_addr` — the IP address of the server.
- `client_addr` — the IP address of the client.

For example, you can print out the handshake data and refuse clients by IP address with the following function:

```
function read_handshake( auth )
  print("<-- let's send him some information about us")
  print("  mysql-version: " .. auth.mysql_version)
  print("  thread-id      : " .. auth.thread_id)
  print("  scramble-buf   : " .. string.format("%q", auth.scramble))
  print("  server-addr    : " .. auth.server_addr)
  print("  client-addr    : " .. auth.client_addr)

  if not auth.client_addr:match("^127.0.0.1:") then
    proxy.response.type = proxy.MYSQLD_PACKET_ERR
    proxy.response.errmsg = "only local connects are allowed"

    print("we don't like this client");

    return proxy.PROXY_SEND_RESULT
  end
end
```

Note that you have to return an error packet to the client by using `proxy.PROXY_SEND_RESULT`.

25.4.5. Examining the authentication credentials with `read_auth()`

The `read_auth()` function is triggered when an authentication handshake is initiated by the client. In the execution sequence, `read_auth()` occurs immediately after `read_handshake()`, so the server selection has already been made, but the connection and authorization information has not yet been provided to the backend server.

The function accepts a single argument, an Lua table containing the authorization information for the handshake process. The entries in the table are:

- `username` — the user login for connecting to the server.
- `password` — the password, encrypted, to be used when connecting.
- `default_db` — the default database to be used once the connection has been made.

For example, you can print the username and password supplied during authorization using:

```
function read_auth( auth )
  print("  username      : " .. auth.username)
  print("  password     : " .. string.format("%q", auth.password))
end
```

You can interrupt the authentication process within this function and return an error packet back to the client by constructing a new packet and returning `proxy.PROXY_SEND_RESULT`:

```
proxy.response.type = proxy.MYSQLD_PACKET_ERR
proxy.response.errmsg = "Logins are not allowed"
return proxy.PROXY_SEND_RESULT
```

25.4.6. Accessing authentication information with `read_auth_result()`

The return packet from the server during authentication is captured by `read_auth_result()`. The only argument to this function is the authentication packet returned by the server. As the packet is a raw MySQL network protocol packet, you must access the first byte to identify the packet type and contents. The `MYSQLD_PACKET_ERR` and `MYSQLD_PACKET_OK` constants can be used to identify whether the authentication was successful:

```
function read_auth_result( auth )
  local state = auth.packet:byte()

  if state == proxy.MYSQLD_PACKET_OK then
    print("<-- auth ok");
  elseif state == proxy.MYSQLD_PACKET_ERR then
    print("<-- auth failed");
  else
  end
```

```

        print("<-- auth ... don't know: " .. string.format("%q", auth.packet));
    end
end

```

25.4.7. Manipulating Queries with `read_query()`

The `read_query()` function is called once for each query submitted by the client and accepts a single argument, the query packet that was provided. To access the content of the packet you must parse the packet contents manually.

For example, you can intercept a query packet and print out the contents using the following function definition:

```

function read_query( packet )
    if packet:byte() == proxy.COM_QUERY then
        print("we got a normal query: " .. packet:sub(2))
    end
end

```

This example checks the first byte of the packet to determine the type. If the type is `COM_QUERY` (see [Section 25.4.2, “Internal Structures” \[1461\]](#)), then we extract the query from the packet and print it out. The structure of the packet type supplied is important. In the case of a `COM_QUERY` packet, the remaining contents of the packet are the text of the query string. In this example, no changes have been made to the query or the list of queries that will ultimately be sent to the MySQL server.

To modify a query, or add new queries, you must populate the query queue (`proxy.queries`) and then execute the queries that you have placed into the queue. If you do not modify the original query or the queue, then the query received from the client is sent to the MySQL server verbatim.

When adding queries to the queue, you should follow these guidelines:

- The packets inserted into the queue must be valid query packets. For each packet, you must set the initial byte to the packet type. If you are appending a query, you can append the query statement to the rest of the packet.
- Once you add a query to the queue, the queue is used as the source for queries sent to the server. If you add a query to the queue to add more information, you must also add the original query to the queue or it will not be executed.
- Once the queue has been populated, you must set the return value from `read_query()` to indicate whether the query queue should be sent to the server.
- When you add queries to the queue, you should add an ID. The ID you specify is returned with the result set so that you identify each query and corresponding result set. The ID has no other purpose than as an identifier for correlating the query and result set. When operating in a passive mode, during profiling for example, you want to identify the original query and the corresponding resultset so that the results expect by the client can be returned correctly.
- Unless your client is designed to cope with more result sets than queries, you should ensure that the number of queries from the client match the number of results sets returned to the client. Using the unique ID and removing result sets you inserted will help.

Normally, the `read_query()` and `read_query_result()` function are used in conjunction with each other to inject additional queries and remove the additional result sets. However, `read_query_result()` is only called if you populate the query queue within `read_query()`.

25.4.8. Manipulating Results with `read_query_result()`

The `read_query_result()` is called for each result set returned by the server only if you have manually injected queries into the query queue. If you have not manipulated the query queue then this function is not called. The function supports a single argument, the result packet, which provides a number of properties:

- `id` — the ID of the result set, which corresponds to the ID that was set when the query packet was submitted to the server when using `append(id)` on the query queue.
- `query` — the text of the original query.
- `query_time` — the number of microseconds required to receive the first row of a result set.
- `response_time` — the number of microseconds required to receive the last row of the result set.
- `resultset` — the content of the result set data.

By accessing the result information from the MySQL server you can extract the results that match the queries that you injected, return different result sets (for example, from a modified query), and even create your own result sets.

The Lua script below, for example, will output the query, followed by the query time and response time (i.e. the time to execute the query and the time to return the data for the query) for each query sent to the server:

```
function read_query( packet )
    if packet:byte() == proxy.COM_QUERY then
        print("we got a normal query: " .. packet:sub(2))
        proxy.queries:append(1, packet )
        return proxy.PROXY_SEND_QUERY
    end
end

function read_query_result(inj)
    print("query-time: " .. (inj.query_time / 1000) .. "ms")
    print("response-time: " .. (inj.response_time / 1000) .. "ms")
end
```

You can access the rows of returned results from the resultset by accessing the rows property of the resultset property of the result that is exposed through `read_query_result()`. For example, you can iterate over the results showing the first column from each row using this Lua fragment:

```
for row in inj.resultset.rows do
    print("injected query returned: " .. row[0])
end
```

Just like `read_query()`, `read_query_result()` can return different values for each result according to the result returned. If you have injected additional queries into the query queue, for example, then you will want to remove the results returned from those additional queries and only return the results from the query originally submitted by the client.

The example below injects additional `SELECT NOW()` statements into the query queue, given them a different ID to the ID of the original query. Within `read_query_result()`, if the ID for the injected queries is identified, we display the result row, and return the `proxy.PROXY_IGNORE_RESULT` from the function so that the result is not returned to the client. If the result is from any other query, we print out the query time information for the query and return the default, which passes on the result set unchanged. We could also have explicitly returned `proxy.PROXY_IGNORE_RESULT` to the MySQL client.

```
function read_query( packet )
    if packet:byte() == proxy.COM_QUERY then
        proxy.queries:append(2, string.char(proxy.COM_QUERY) .. "SELECT NOW()" )
        proxy.queries:append(1, packet )
        proxy.queries:append(2, string.char(proxy.COM_QUERY) .. "SELECT NOW()" )
        return proxy.PROXY_SEND_QUERY
    end
end

function read_query_result(inj)
    if inj.id == 2 then
        for row in inj.resultset.rows do
            print("injected query returned: " .. row[0])
        end
        return proxy.PROXY_IGNORE_RESULT
    else
        print("query-time: " .. (inj.query_time / 1000) .. "ms")
        print("response-time: " .. (inj.response_time / 1000) .. "ms")
    end
end
```

For further examples, see [Section 25.5, “Using MySQL Proxy”](#).

25.5. Using MySQL Proxy

There are a number of different ways to use MySQL Proxy. At the most basic level, you can allow MySQL Proxy to pass on queries from clients to a single server. To use MySQL proxy in this mode, you just have to specify the backend server that the proxy should connect to on the command line:

```
$ mysql-proxy --proxy-backend-addresses=sakila:3306
```

If you specify multiple backend MySQL servers then the proxy will connect each client to each server in a round-robin fashion. For example, imagine you have two MySQL servers, A and B. The first client to connect will be connected to server A, the second to server B, the third to server C. For example:

```
$ mysql-proxy \
  --proxy-backend-addresses=narcissus:3306 \
  --proxy-backend-addresses=nostromo:3306
```

When you have specified multiple servers in this way, the proxy will automatically identify when a MySQL server has become unavailable and mark it accordingly. New connections will automatically be attached to a server that is available, and a warning will be reported to the standard output from `mysql-proxy`:

```
network-mysqld.c.367: connect(nostromo:3306) failed: Connection refused
network-mysqld-proxy.c.2405: connecting to backend (nostromo:3306) failed, marking it as down for ...
```

Lua scripts enable a finer level of control, both over the connections and their distribution and how queries and result sets are processed. When using an Lua script, you must specify the name of the script on the command line using the `-proxy-lua-script` option:

```
$ mysql-proxy --proxy-lua-script=mc.lua --proxy-backend-addresses=sakila:3306
```

When you specify a script, the script is not executed until a connection is made. This means that faults with the script will not be raised until the script is executed. Script faults will not affect the distribution of queries to backend MySQL servers.

Note

Because the script is not read until the connection is made, you can modify the contents of the Lua script file while the proxy is still running and the script will automatically be used for the next connection. This ensures that MySQL Proxy remains available because it does not have to be restarted for the changes to take effect.

25.5.1. Using the Administration Interface

The `mysql-proxy` administration interface can be accessed using any MySQL client using the standard protocols. You can use the administration interface to gain information about the proxy server as a whole - standard connections to the proxy are isolated to operate as if you were connected directly to the backend MySQL server. Currently, the interface supports a limited set of functionality designed to provide connection and configuration information.

Because connectivity is provided over the standard MySQL protocol, you must access this information using SQL syntax. By default, the administration port is configured as 4041. You can change this port number using the `--admin-address` command line option.

To get a list of the currently active connections to the proxy:

```
mysql> select * from proxy_connections;
+----+-----+-----+-----+
| id | type  | state | db   |
+----+-----+-----+-----+
| 0  | server | 0     |     |
| 1  | proxy  | 0     |     |
| 2  | server | 10    |     |
+----+-----+-----+-----+
3 rows in set (0.00 sec)
```

To get the current configuration:

```
mysql> select * from proxy_config;
+-----+-----+
| option                | value |
+-----+-----+
| admin.address         | :4041 |
| proxy.address         | :4040 |
| proxy.lua_script      | mc.lua |
| proxy.backend_addresses[0] | mysql:3306 |
| proxy.fix_bug_25371   | 0     |
| proxy.profiling       | 1     |
+-----+-----+
6 rows in set (0.01 sec)
```

Chapter 26. Extending MySQL

26.1. MySQL Internals

This chapter describes a lot of things that you need to know when working on the MySQL code. If you plan to contribute to MySQL development, want to have access to the bleeding-edge versions of the code, or just want to keep track of development, follow the instructions in [Section 2.4.15.3, “Installing from the Development Source Tree”](#). If you are interested in MySQL internals, you should also subscribe to our `internals` mailing list. This list has relatively low traffic. For details on how to subscribe, please see [Section 1.7.1, “MySQL Mailing Lists”](#). All developers at MySQL AB are on the `internals` list and we help other people who are working on the MySQL code. Feel free to use this list both to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

26.1.1. MySQL Threads

The MySQL server creates the following threads:

- One thread manages TCP/IP file connection requests and creates a new dedicated thread to handle the authentication and SQL statement processing for each connection. (On Unix, this thread also manages Unix socket file connection requests.) On Windows, a similar thread manages shared-memory connection requests, and a thread manages named-pipe connection requests. Every client connection has its own thread, although the manager threads try to avoid creating threads by consulting the thread cache first to see whether a cached thread can be used for a new connection.
- On a master replication server, slave server connections are like client connections: There is one thread per connected slave.
- On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.
- The signal thread handles all signals. This thread also normally handles alarms and calls `process_alarm()` to force timeouts on connections that have been idle too long.
- If InnoDB is used, there will be 4 additional threads by default. Those are file I/O threads, controlled by the `innodb_file_io_threads` parameter. See [Section 13.2.4, “InnoDB Startup Options and System Variables”](#).
- If `mysqld` is compiled with `-DUSE_ALARM_THREAD`, a dedicated thread that handles alarms is created. This is only used on some systems where there are problems with `sigwait()` or if you want to use the `thr_alarm()` code in your application without a dedicated signal handling thread.
- If the server is started with the `--flush_time=val` option, a dedicated thread is created to flush all tables every `val` seconds.
- Each table for which `INSERT DELAYED` statements are issued gets its own thread.

`mysqladmin processlist` only shows the connection, `INSERT DELAYED`, and replication threads.

MySQL Enterprise

For expert advice on thread management subscribe to the MySQL Enterprise Monitor. For more information see, <http://www.mysql.com/products/enterprise/advisors.html>.

26.1.2. MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform regression tests on the MySQL code. These tests can be run on Unix.

The current set of test cases doesn't test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code. We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (`mysqltest`), a Perl script to run all tests (`mysql-test-run.pl`), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type `make test` from the source root directory, or change location to the `mysql-test` directory and type `./mysql-test-run.pl`. If you have installed a binary distribution, change location to the `mysql-test` directory under the installation root directory (for example, `/usr/local/mysql/mysql-test`), and run `./mysql-test-run.pl`. All tests should succeed. If any do not, feel free to try to find out why and report the problem if it indicates a bug in MySQL. See [Section 1.8, “How to Report Bugs or Problems”](#).

If one test fails, you should run `mysql-test-run.pl` with the `--force` option to check whether any other tests fail.

If you have a copy of `mysqld` running on the machine where you want to run the test suite, you do not have to stop it, as long as it is not using ports 9306 or 9307. If either of those ports is taken, you should set the `MTR_BUILD_THREAD` environment variable to an appropriate value, and the test suite will use a different set of ports for master, slave, NDB, and Instance Manager). For example:

```
shell> export MTR_BUILD_THREAD=31
shell> ./mysql-test-run.pl [options] [test_name]
```

In the `mysql-test` directory, you can run an individual test case with `./mysql-test-run.pl test_name`.

You can use the `mysqltest` language to write your own test cases. This is documented in the MySQL Test Framework manual, available at <http://dev.mysql.com/doc/>.

If you have a question about the test suite, or have a test case to contribute, send an email message to the MySQL `internals` mailing list. See [Section 1.7.1, “MySQL Mailing Lists”](#). This list does not accept attachments, so you should FTP all the relevant files to: <ftp://ftp.mysql.com/pub/mysql/upload/>

26.2. Adding New Functions to MySQL

There are three ways to add new functions to MySQL:

- You can add functions through the user-defined function (UDF) interface. User-defined functions are compiled as object files and then added to and removed from the server dynamically using the `CREATE FUNCTION` and `DROP FUNCTION` statements. See [Section 26.2.2, “CREATE FUNCTION Syntax”](#).
- You can add functions as native (built-in) MySQL functions. Native functions are compiled into the `mysqld` server and become available on a permanent basis.
- Another way to add functions is by creating stored functions. These are written using SQL statements rather than by compiling object code. The syntax for writing stored functions is not covered here. See [Chapter 18, *Stored Procedures and Functions*](#).

Each method of creating compiled functions has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function into the server, you don't need to do that.
- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a binary MySQL distribution. No access to MySQL source is necessary.
- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a newer version for which the UDF interface changes. For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add new functions, they can be invoked in SQL statements just like native functions such as `ABS()` or `SOUNDEX()`.

See [Section 8.2.3, “Function Name Parsing and Resolution”](#), for the rules describing how the server interprets references to different kinds of functions.

The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the `sql/udf_example.c` file that is provided in MySQL source distributions.

26.2.1. Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values and can accept arguments of those same types.
- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.

- Information is provided to functions that enables them to check the number, types, and names of the arguments passed to them.
- You can tell MySQL to coerce arguments to a given type before passing them to a function.
- You can indicate that a function returns `NULL` or that an error occurred.

26.2.2. CREATE FUNCTION Syntax

```
CREATE [AGGREGATE] FUNCTION function_name RETURNS {STRING|INTEGER|REAL|DECIMAL}
SONAME shared_library_name
```

A user-defined function (UDF) is a way to extend MySQL with a new function that works like a native (built-in) MySQL function such as `ABS()` or `CONCAT()`.

function_name is the name that should be used in SQL statements to invoke the function. The `RETURNS` clause indicates the type of the function's return value. As of MySQL 5.0.3, `DECIMAL` is a legal value after `RETURNS`, but currently `DECIMAL` functions return string values and should be written like `STRING` functions.

shared_library_name is the basename of the shared object file that contains the code that implements the function. The file must be located in a directory that is searched by your system's dynamic linker.

To create a function, you must have the `INSERT` and privilege for the `mysql` database. This is necessary because `CREATE FUNCTION` adds a row to the `mysql.func` system table that records the function's name, type, and shared library name. If you do not have this table, you should run the `mysql_upgrade` command to create it. See Section 5.5.8, “`mysql_upgrade` — Check Tables for MySQL Upgrade”.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

For instructions on writing user-defined functions, see Section 26.2.4, “Adding a New User-Defined Function”. For the UDF mechanism to work, functions must be written in C or C++ (or another language that can use C calling conventions), your operating system must support dynamic loading and you must have compiled `mysqld` dynamically (not statically).

An `AGGREGATE` function works exactly like a native MySQL aggregate (summary) function such as `SUM` or `COUNT()`. For `AGGREGATE` to work, your `mysql.func` table must contain a `type` column. If your `mysql.func` table does not have this column, you should run the `mysql_upgrade` program to create it (see Section 5.5.8, “`mysql_upgrade` — Check Tables for MySQL Upgrade”).

26.2.3. DROP FUNCTION Syntax

```
DROP FUNCTION function_name
```

This statement drops the user-defined function (UDF) named *function_name*.

To drop a function, you must have the `DELETE` privilege for the `mysql` database. This is because `DROP FUNCTION` removes a row from the `mysql.func` system table that records the function's name, type, and shared library name.

`DROP FUNCTION` is also used to drop stored functions (see Section 18.2.3, “`DROP PROCEDURE` and `DROP FUNCTION Syntax`”).

26.2.4. Adding a New User-Defined Function

For the UDF mechanism to work, functions must be written in C or C++ (or another language that can use C calling conventions), and your operating system must support dynamic loading. The MySQL source distribution includes a file `sql/udf_example.c` that defines 5 new functions. Consult this file to see how UDF calling conventions work. UDF-related symbols and data structures are defined in the `include/mysql_com.h` header file. (You need not include this header file directly because it is included by `mysql.h`.)

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. Note that these constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see Section 2.4.15.2, “Typical configure Options”, and Section 2.4.15.4, “Dealing with Problems Compiling MySQL”.

To be able to use UDFs, you need to link `mysqld` dynamically. Don't configure MySQL using `-with-mysqld-ldflags=-all-static`. If you want to use a UDF that needs to access symbols from `mysqld` (for ex-

ample, the `metaphone` function in `sql/udf_example.c` that uses `default_charset_info`), you must link the program with `-rdynamic` (see `man dlopen`). If you plan to use UDFs, the rule of thumb is to configure MySQL with `-with-mysqld-ldflags=-rdynamic` unless you have a very good reason not to.

For each function that you want to use in SQL statements, you should define corresponding C (or C++) functions. In the following discussion, the name “xxx” is used for an example function name. To distinguish between SQL and C/C++ usage, `XXX()` (uppercase) indicates an SQL function call, and `xxx()` (lowercase) indicates a C/C++ function call.

The C/C++ functions that you write to implement the interface for `XXX()` are:

- `xxx()` (required)

The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C/C++ function is shown here:

SQL Type	C/C++ Type
<code>STRING</code>	<code>char *</code>
<code>INTEGER</code>	<code>long long</code>
<code>REAL</code>	<code>double</code>

It is also possible to declare a `DECIMAL` function, but currently the value is returned as a string, so you should write the UDF as though it were a `STRING` function. `ROW` functions are not implemented.

- `xxx_init()` (optional)

The initialization function for `xxx()`. It can be used for the following purposes:

- To check the number of arguments to `XXX()`.
- To check that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the types you want when the main function is called.
- To allocate any memory required by the main function.
- To specify the maximum length of the result.
- To specify (for `REAL` functions) the maximum number of decimal places in the result.
- To specify whether the result can be `NULL`.

- `xxx_deinit()` (optional)

The deinitialization function for `xxx()`. It should deallocate any memory allocated by the initialization function.

When an SQL statement invokes `XXX()`, MySQL calls the initialization function `xxx_init()` to let it perform any required setup, such as argument checking or memory allocation. If `xxx_init()` returns an error, MySQL aborts the SQL statement with an error message and does not call the main or deinitialization functions. Otherwise, MySQL calls the main function `xxx()` once for each row. After all rows have been processed, MySQL calls the deinitialization function `xxx_deinit()` so that it can perform any required cleanup.

For aggregate functions that work like `SUM()`, you must also provide the following functions:

- `xxx_clear()` (required in 5.0)

Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.

- `xxx_add()` (required)

Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. Call `xxx_init()` to let the aggregate function allocate any memory it needs for storing results.
2. Sort the table according to the `GROUP BY` expression.

3. Call `xxx_clear()` for the first row in each new group.
4. Call `xxx_add()` for each new row that belongs in the same group.
5. Call `xxx()` to get the result for the aggregate when the group changes or after the last row has been processed.
6. Repeat 3-5 until all rows has been processed
7. Call `xxx_deinit()` to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not allowed to allocate any global or static variables that change! If you need memory, you should allocate it in `xxx_init()` and free it in `xxx_deinit()`.

26.2.4.1. UDF Calling Sequences for Simple Functions

This section describes the different functions that you need to define when you create a simple UDF. Section 26.2.4, “Adding a New User-Defined Function”, describes the order in which MySQL calls these functions.

The main `xxx()` function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function `XXX()` to return `STRING`, `INTEGER`, or `REAL` in the `CREATE FUNCTION` statement:

For `STRING` functions:

```
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
         char *result, unsigned long *length,
         char *is_null, char *error);
```

For `INTEGER` functions:

```
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
             char *is_null, char *error);
```

For `REAL` functions:

```
double xxx(UDF_INIT *initid, UDF_ARGS *args,
          char *is_null, char *error);
```

`DECIMAL` functions return string values and should be declared the same way as `STRING` functions. `ROW` functions are not implemented.

The initialization and deinitialization functions are declared like this:

```
my_bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);
void xxx_deinit(UDF_INIT *initid);
```

The `initid` parameter is passed to all three functions. It points to a `UDF_INIT` structure that is used to communicate information between functions. The `UDF_INIT` structure members follow. The initialization function should fill in any members that it wishes to change. (To use the default for a member, leave it unchanged.)

- `my_bool maybe_null`

`xxx_init()` should set `maybe_null` to 1 if `xxx()` can return `NULL`. The default value is 1 if any of the arguments are declared `maybe_null`.

- `unsigned int decimals`

The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. (For example, if the function is passed `1.34`, `1.345`, and `1.3`, the default would be 3, because `1.345` has 3 decimal digits.

- `unsigned int max_length`

The maximum length of the result. The default `max_length` value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is 21 digits. For real functions, the default is 13 plus the number of decimal digits indicated by `initid->decimals`. (For numeric functions, the length includes any sign or decimal point characters.)

If you want to return a blob value, you can set `max_length` to 65KB or 16MB. This memory is not allocated, but the value is used to decide which data type to use if there is a need to temporarily store the data.

- `char *ptr`

A pointer that the function can use for its own purposes. For example, functions can use `initid->ptr` to communicate allocated memory among themselves. `xxx_init()` should allocate the memory and assign it to this pointer:

```
initid->ptr = allocated_memory;
```

In `xxx()` and `xxx_deinit()`, refer to `initid->ptr` to use or deallocate the memory.

- `my_bool const_item`

`xxx_init()` should set `const_item` to 1 if `xxx()` always returns the same value and to 0 otherwise.

26.2.4.2. UDF Calling Sequences for Aggregate Functions

This section describes the different functions that you need to define when you create an aggregate UDF. [Section 26.2.4, “Adding a New User-Defined Function”](#), describes the order in which MySQL calls these functions.

- `xxx_reset()`

This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given `UDF_ARGS` argument as the first value in your internal summary value for the group. Declare `xxx_reset()` as follows:

```
char *xxx_reset(UDF_INIT *initid, UDF_ARGS *args,
               char *is_null, char *error);
```

`xxx_reset()` is not needed or used in MySQL 5.0, in which the UDF interface uses `xxx_clear()` instead. However, you can define both `xxx_reset()` and `xxx_clear()` if you want to have your UDF work with older versions of the server. (If you do include both functions, the `xxx_reset()` function in many cases can be implemented internally by calling `xxx_clear()` to reset all variables, and then calling `xxx_add()` to add the `UDF_ARGS` argument as the first value in the group.)

- `xxx_clear()`

This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare `xxx_clear()` as follows:

```
char *xxx_clear(UDF_INIT *initid, char *is_null, char *error);
```

`is_null` is set to point to `CHAR(0)` before calling `xxx_clear()`.

If something went wrong, you can store a value in the variable to which the `error` argument points. `error` points to a single-byte variable, not to a string buffer.

`xxx_clear()` is required by MySQL 5.0.

- `xxx_add()`

This function is called for all rows that belong to the same group, except for the first row. You should use it to add the value in the `UDF_ARGS` argument to your internal summary variable.

```
char *xxx_add(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

The `xxx()` function for an aggregate UDF should be declared the same way as for a non-aggregate UDF. See [Section 26.2.4.1, “UDF Calling Sequences for Simple Functions”](#).

For an aggregate UDF, MySQL calls the `xxx()` function after all rows in the group have been processed. You should normally never access its `UDF_ARGS` argument here but instead return a value based on your internal summary variables.

Return value handling in `xxx()` should be done the same way as for a non-aggregate UDF. See [Section 26.2.4.4, “UDF Return Values and Error Handling”](#).

The `xxx_reset()` and `xxx_add()` functions handle their `UDF_ARGS` argument the same way as functions for non-aggregate UDFs. See [Section 26.2.4.3, “UDF Argument Processing”](#).

The pointer arguments to `is_null` and `error` are the same for all calls to `xxx_reset()`, `xxx_clear()`, `xxx_add()` and `xxx()`. You can use this to remember that you got an error or whether the `xxx()` function should return `NULL`. You should not store a string into `*error`! `error` points to a single-byte variable, not to a string buffer.

`*is_null` is reset for each group (before calling `xxx_clear()`). `*error` is never reset.

If `*is_null` or `*error` are set when `xxx()` returns, MySQL returns `NULL` as the result for the group function.

26.2.4.3. UDF Argument Processing

The `args` parameter points to a `UDF_ARGS` structure that has the members listed here:

- `unsigned int arg_count`

The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

```
if (args->arg_count != 2)
{
    strcpy(message, "XXX() requires two arguments");
    return 1;
}
```

For other `UDF_ARGS` member values that are arrays, array references are zero-based. That is, refer to array members using index values from 0 to `args->arg_count - 1`.

- `enum Item_result *arg_type`

A pointer to an array containing the types for each argument. The possible type values are `STRING_RESULT`, `INT_RESULT`, `REAL_RESULT`, and `DECIMAL_RESULT`.

To make sure that arguments are of a given type and return an error if they are not, check the `arg_type` array in the initialization function. For example:

```
if (args->arg_type[0] != STRING_RESULT ||
    args->arg_type[1] != INT_RESULT)
{
    strcpy(message, "XXX() requires a string and an integer");
    return 1;
}
```

Arguments of type `DECIMAL_RESULT` are passed as strings, so you should handle them the same way as `STRING_RESULT` values.

As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the `arg_type` elements to the types you want. This causes MySQL to coerce arguments to those types for each call to `xxx()`. For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in `xxx_init()`:

```
args->arg_type[0] = STRING_RESULT;
args->arg_type[1] = INT_RESULT;
```

Exact-value decimal arguments such as `1.3` or `DECIMAL` column values are passed with a type of `DECIMAL_RESULT`. However, the values are passed as strings. If you want to receive a number, use the initialization function to specify that the argument should be coerced to a `REAL_RESULT` value:

```
args->arg_type[2] = REAL_RESULT;
```

Note

Prior to MySQL 5.0.3, decimal arguments were passed as `REAL_RESULT` values. If you upgrade to a newer version and find that your UDF now receives string values, use the initialization function to coerce the arguments to numbers as just described.

- `char **args`

`args->args` communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument `i`, `args->args[i]` points to the argument value. (See below for instructions on how to

access the value properly.) For a non-constant argument, `args->args[i]` is 0. A constant argument is an expression that uses only constants, such as `3` or `4*7-2` or `SIN(3.14)`. A non-constant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with non-constant arguments.

For each invocation of the main function, `args->args` contains the actual arguments that are passed for the row currently being processed.

If argument `i` represents `NULL`, `args->args[i]` is a null pointer (0). If the argument is not `NULL`, functions can refer to it as follows:

- An argument of type `STRING_RESULT` is given as a string pointer plus a length, to allow handling of binary data or data of arbitrary length. The string contents are available as `args->args[i]` and the string length is `args->lengths[i]`. Do not assume that the string is null-terminated.
- For an argument of type `INT_RESULT`, you must cast `args->args[i]` to a `long long` value:

```
long long int_val;
int_val = *((long long*) args->args[i]);
```

- For an argument of type `REAL_RESULT`, you must cast `args->args[i]` to a `double` value:

```
double real_val;
real_val = *((double*) args->args[i]);
```

- For an argument of type `DECIMAL_RESULT`, the value is passed as a string and should be handled like a `STRING_RESULT` value.
- `ROW_RESULT` arguments are not implemented.
- `unsigned long *lengths`

For the initialization function, the `lengths` array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, `lengths` contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types `INT_RESULT` or `REAL_RESULT`, `lengths` still contains the maximum length of the argument (as for the initialization function).

- `char *maybe_null`

For the initialization function, the `maybe_null` array indicates for each argument whether the argument value might be null (0 if no, 1 if yes).

- `char **attributes`

`args->attributes` communicates information about the names of the UDF arguments. For argument `i`, the attribute name is available as a string in `args->attributes[i]` and the attribute length is `args->attribute_lengths[i]`. Do not assume that the string is null-terminated.

By default, the name of a UDF argument is the text of the expression used to specify the argument. For UDFs, an argument may also have an optional `[AS] alias_name` clause, in which case the argument name is `alias_name`. The `attributes` value for each argument thus depends on whether an alias was given.

Suppose that a UDF `my_udf()` is invoked as follows:

```
SELECT my_udf(expr1, expr2 AS alias1, expr3 alias2);
```

In this case, the `attributes` and `attribute_lengths` arrays will have these values:

```
args->attributes[0] = "expr1"
args->attribute_lengths[0] = 5

args->attributes[1] = "alias1"
args->attribute_lengths[1] = 6

args->attributes[2] = "alias2"
args->attribute_lengths[2] = 6
```

- `unsigned long *attribute_lengths`

The `attribute_lengths` array indicates the length of each argument name.

26.2.4.4. UDF Return Values and Error Handling

The initialization function should return 0 if no error occurred and 1 otherwise. If an error occurs, `xxx_init()` should store a null-terminated error message in the `message` parameter. The message is returned to the client. The message buffer is `MYSQL_ERRMSG_SIZE` characters long, but you should try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function `xxx()` is the function value, for `long long` and `double` functions. A string function should return a pointer to the result and set `*result` and `*length` to the contents and length of the return value. For example:

```
memcpy(result, "result string", 13);
*length = 13;
```

The `result` buffer that is passed to the `xxx()` function is 255 bytes long. If your result fits in this, you don't have to worry about memory allocation for results.

If your string function needs to return a string longer than 255 bytes, you must allocate the space for it with `malloc()` in your `xxx_init()` function or your `xxx()` function and free it in your `xxx_deinit()` function. You can store the allocated memory in the `ptr` slot in the `UDF_INIT` structure for reuse by future `xxx()` calls. See Section 26.2.4.1, “UDF Calling Sequences for Simple Functions”.

To indicate a return value of `NULL` in the main function, set `*is_null` to 1:

```
*is_null = 1;
```

To indicate an error return in the main function, set `*error` to 1:

```
*error = 1;
```

If `xxx()` sets `*error` to 1 for any row, the function value is `NULL` for the current row and for any subsequent rows processed by the statement in which `XXX()` was invoked. (`xxx()` is not even called for subsequent rows.)

26.2.4.5. Compiling and Installing User-Defined Functions

Files implementing UDFs must be compiled and installed on the host where the server runs. This process is described below for the example UDF file `sql/udf_example.c` that is included in the MySQL source distribution.

The immediately following instructions are for Unix. Instructions for Windows are given later in this section.

The `udf_example.c` file contains the following functions:

- `metaphon()` returns a metaphon string of the string argument. This is something like a soundex string, but it's more tuned for English.
- `myfunc_double()` returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.
- `myfunc_int()` returns the sum of the length of its arguments.
- `sequence([const int])` returns a sequence starting from the given number or 1 if no number has been given.
- `lookup()` returns the IP number for a hostname.
- `reverse_lookup()` returns the hostname for an IP number. The function may be called either with a single string argument of the form `'xxx.xxx.xxx.xxx'` or with four numbers.

A dynamically loadable file should be compiled as a sharable object file, using a command something like this:

```
shell> gcc -shared -o udf_example.so udf_example.c
```

If you are using `gcc` with `configure` and `libtool` (which is how MySQL is configured), you should be able to create `udf_example.so` with a simpler command:

```
shell> make udf_example.la
```

After you compile a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from `udf_example.c` using `gcc` directly produces a file named `udf_example.so`. Compiling the shared object using `make` produces a file named something like `udf_example.so.0.0.0` in the `.libs` directory (the exact name may vary from platform to platform). Copy the shared object to some directory such as `/usr/lib` that is searched by your system's dynamic (runtime)

linker, or add the directory in which you placed the shared object to the linker configuration file (for example, `/etc/ld.so.conf`).

The dynamic linker name is system-specific (for example, `ld-elf.so.1` on FreeBSD, `ld.so` on Linux, or `dyld` on Mac OS X). Consult your system documentation for information about the linker name and how to configure it.

On many systems, you can also set the `LD_LIBRARY` or `LD_LIBRARY_PATH` environment variable to point at the directory where you have the files for your UDF. The `dlopen` manual page tells you which variable you should use on your system. You should set this in `mysql.server` or `mysqld_safe` startup scripts and restart `mysqld`.

On some systems, the `ldconfig` program that configures the dynamic linker does not recognize a shared object unless its name begins with `lib`. In this case you should rename a file such as `udf_example.so` to `libudf_example.so`.

On Windows, you can compile user-defined functions by using the following procedure:

1. You need to obtain the BitKeeper source repository for MySQL 5.0. See [Section 2.4.15.3, “Installing from the Development Source Tree”](#).
2. You must obtain the CMake build utility from <http://www.cmake.org>. (Version 2.4.2 or later is required).
3. In the source repository, look in the `sql` directory. There are files named `udf_example.def` and `udf_example.c` there. Copy both files from this directory to your working directory.
4. Create a CMake `makefile` with these contents:

```
PROJECT(udf_example)

# Path for MySQL include directory
INCLUDE_DIRECTORIES("c:/mysql/include")

ADD_DEFINITIONS("-DHAVE_DLOPEN")
ADD_LIBRARY(udf_example MODULE udf_example.c udf_example.def)
TARGET_LINK_LIBRARIES(udf_example wsock32)
```

5. Create the VC project and solution files:

```
cmake -G "<Generator>"
```

Invoking `cmake --help` shows you a list of valid Generators.

6. Create `udf_example.dll`:

```
devenv udf_example.sln /build Release
```

After the shared object file has been installed, notify `mysqld` about the new functions with these statements:

```
mysql> CREATE FUNCTION metaphon RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION myfunc_double RETURNS REAL SONAME 'udf_example.so';
mysql> CREATE FUNCTION myfunc_int RETURNS INTEGER SONAME 'udf_example.so';
mysql> CREATE FUNCTION lookup RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION reverse_lookup
-> RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE AGGREGATE FUNCTION avgcost
-> RETURNS REAL SONAME 'udf_example.so';
```

Functions can be deleted using `DROP FUNCTION`:

```
mysql> DROP FUNCTION metaphon;
mysql> DROP FUNCTION myfunc_double;
mysql> DROP FUNCTION myfunc_int;
mysql> DROP FUNCTION lookup;
mysql> DROP FUNCTION reverse_lookup;
mysql> DROP FUNCTION avgcost;
```

The `CREATE FUNCTION` and `DROP FUNCTION` statements update the `func` system table in the `mysql` database. The function's name, type and shared library name are saved in the table. You must have the `INSERT` and `DELETE` privileges for the `mysql` database to create and drop functions.

You should not use `CREATE FUNCTION` to add a function that has previously been created. If you need to reinstall a function, you should remove it with `DROP FUNCTION` and then reinstall it with `CREATE FUNCTION`. You would need to do this, for example, if you recompile a new version of your function, so that `mysqld` gets the new version. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

If the new function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

26.2.4.6. User-Defined Function Security Precautions

MySQL takes the following measures to prevent misuse of user-defined functions.

You must have the `INSERT` privilege to be able to use `CREATE FUNCTION` and the `DELETE` privilege to be able to use `DROP FUNCTION`. This is necessary because these statements add and delete rows from the `mysql.func` table.

UDFs should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. As of MySQL 5.0.3, `mysqld` supports an `--allow-suspicious-udfs` option that controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off, to prevent attempts at loading functions from shared object files other than those containing legitimate UDFs. If you have older UDFs that contain only the `xxx` symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the `--allow-suspicious-udfs` option. Otherwise, you should avoid enabling this capability.

UDF object files cannot be placed in arbitrary directories. They must be located in some system directory that the dynamic linker is configured to search. To enforce this restriction and prevent attempts at specifying pathnames outside of directories searched by the dynamic linker, MySQL checks the shared object file name specified in `CREATE FUNCTION` statements for pathname delimiter characters. As of MySQL 5.0.3, MySQL also checks for pathname delimiters in filenames stored in the `mysql.func` table when it loads functions. This prevents attempts at specifying illegitimate pathnames through direct manipulation of the `mysql.func` table. For information about UDFs and the runtime linker, see [Section 26.2.4.5, “Compiling and Installing User-Defined Functions”](#).

26.2.5. Adding a New Native Function

The procedure for adding a new native function is described here. Note that you cannot add native functions to a binary distribution because the procedure involves modifying MySQL source code. You must compile MySQL yourself from a source distribution. Also note that if you migrate to another version of MySQL (for example, when a new version is released), you need to repeat the procedure with the new version.

To add a new native MySQL function, follow these steps:

1. Add one line to `lex.h` that defines the function name in the `sql_functions[]` array.
2. If the function prototype is simple (just takes zero, one, two or three arguments), you should in `lex.h` specify `SYM(FUNC_ARGN)` (where `N` is the number of arguments) as the second argument in the `sql_functions[]` array and add a function that creates a function object in `item_create.cc`. Take a look at "ABS" and `create_funcs_abs()` for an example of this.

If the function prototype is complicated (for example, if it takes a variable number of arguments), you should add two lines to `sql_yacc.yy`. One indicates the preprocessor symbol that `yacc` should define (this should be added at the beginning of the file). Then define the function parameters and add an “item” with these parameters to the `simple_expr` parsing rule. For an example, check all occurrences of `ATAN` in `sql_yacc.yy` to see how this is done.

3. In `item_func.h`, declare a class inheriting from `Item_num_func` or `Item_str_func`, depending on whether your function returns a number or a string.
4. In `item_func.cc`, add one of the following declarations, depending on whether you are defining a numeric or string function:

```
double Item_func_newname::val()
longlong Item_func_newname::val_int()
String *Item_func_newname::Str(String *str)
```

If you inherit your object from any of the standard items (like `Item_num_func`), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the `Item_str_func` class defines a `val()` function that executes `atof()` on the value returned by `::str()`.

5. If the function is non-deterministic, you should include the following statement in the item constructor to indicate that function results should not be cached:

```
current_thd->lex->safe_to_cache_query=0;
```

A function is non-deterministic if, given fixed values for its arguments, it can return different results for different invocations.

6. You should probably also define the following object function:

```
void Item_func_newname::fix_length_and_dec()
```

This function should at least calculate `max_length` based on the given arguments. `max_length` is the maximum number of characters the function may return. This function should also set `maybe_null = 0` if the main function can't return a `NULL` value. The function can check whether any of the function arguments can return `NULL` by checking the arguments' `maybe_null` variable. You can take a look at `Item_func_mod::fix_length_and_dec` for a typical example of how to do this.

All functions must be thread-safe. In other words, don't use any global or static variables in the functions without protecting them with mutexes)

If you want to return `NULL`, from `::val()`, `::val_int()` or `::str()` you should set `null_value` to 1 and return 0.

For `::str()` object functions, there are some additional considerations to be aware of:

- The `String *str` argument provides a string buffer that may be used to hold the result. (For more information about the `String` type, take a look at the `sql_string.h` file.)
- The `::str()` function should return the string that holds the result or `(char*) 0` if the result is `NULL`.
- All current string functions try to avoid allocating any memory unless absolutely necessary!

If the new native function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

26.3. Adding New Procedures to MySQL

In MySQL, you can define a procedure in C++ that can access and modify the data in a query before it is sent to the client. The modification can be done on a row-by-row or `GROUP BY` level.

We have created an example procedure to show you what can be done.

Additionally, we recommend that you take a look at `mysqlua`. With this you can use the LUA language to load a procedure at runtime into `mysqld`.

26.3.1. Procedure Analyse

```
analyse([max_elements[,max_memory]])
```

This procedure is defined in the `sql/sql_analyse.cc` file. It examines the result from a query and returns an analysis of the results that suggests optimal data types for each column. To obtain this analysis, append `PROCEDURE ANALYSE` to the end of a `SELECT` statement:

```
SELECT ... FROM ... WHERE ... PROCEDURE ANALYSE([max_elements,[max_memory]])
```

For example:

```
SELECT col1, col2 FROM table1 PROCEDURE ANALYSE(10, 2000);
```

The results show some statistics for the values returned by the query, and propose an optimal data type for the columns. This can be helpful for checking your existing tables, or after importing new data. You may need to try different settings for the arguments so that `PROCEDURE ANALYSE()` does not suggest the `ENUM` data type when it is not appropriate.

The arguments are optional and are used as follows:

- `max_elements` (default 256) is the maximum number of distinct values that `analyse` notices per column. This is used by `analyse` to check whether the optimal data type should be of type `ENUM`.
- `max_memory` (default 8192) is the maximum amount of memory that `analyse` should allocate per column while trying to find all distinct values.

26.3.2. Writing a Procedure

For the moment, the only documentation for this is the source.

You can find all information about procedures by examining the following files:

- `sql/sql_analyse.cc`
- `sql/procedure.h`
- `sql/procedure.cc`
- `sql/sql_select.cc`

26.4. Debugging and Porting MySQL

This appendix helps you port MySQL to other operating systems. Do check the list of currently supported operating systems first. See [Section 2.4.2, “Operating Systems Supported by MySQL Community Server”](#). If you have created a new port of MySQL, please let us know so that we can list it here and on our Web site (<http://www.mysql.com/>), recommending it to other users.

Note: If you create a new port of MySQL, you are free to copy and distribute it under the GPL license, but it does not make you a copyright holder of MySQL.

A working POSIX thread library is needed for the server. On Solaris 2.5 we use Sun PThreads (the native thread support in 2.4 and earlier versions is not good enough), on Linux we use LinuxThreads by Xavier Leroy, <Xavier.Leroy@inria.fr>.

The hard part of porting to a new Unix variant without good native thread support is probably to port MIT-pthreads. See [mit-pthreads/README](#) and Programming POSIX Threads (<http://www.humanfactor.com/pthreads/>).

Up to MySQL 4.0.2, the MySQL distribution included a patched version of Chris Provenzano's Pthreads from MIT (see the MIT Pthreads Web page at <http://www.mit.edu/afs/sipb/project/pthreads/> and a programming introduction at http://www.mit.edu:8001/people/proven/IAP_2000/). These can be used for some operating systems that do not have POSIX threads. See [Section 2.4.15.5, “MIT-pthreads Notes”](#).

It is also possible to use another user level thread package named FSU Pthreads (see <http://moss.csc.ncsu.edu/~mueller/pthreads/>). This implementation is being used for the SCO port.

See the `thr_lock.c` and `thr_alarm.c` programs in the `mysys` directory for some tests/examples of these problems.

Both the server and the client need a working C++ compiler. We use `gcc` on many platforms. Other compilers that are known to work are SPARCworks, Sun Forte, Irix `cc`, HP-UX `aCC`, IBM AIX `x1C_r`, Intel `ecc/icc` and Compaq `cxx`.

Important

If you are trying to build MySQL 5.1 with `icc` on the IA64 platform, and need support for MySQL Cluster, you should first ensure that you are using `icc` version 9.1.043 or later. (For details, see [Bug#21875](#).)

To compile only the client use `./configure --without-server`.

There is currently no support for only compiling the server, nor is it likely to be added unless someone has a good reason for it.

If you want/need to change any `Makefile` or the configure script you also need GNU Automake and Autoconf. See [Section 2.4.15.3, “Installing from the Development Source Tree”](#).

All steps needed to remake everything from the most basic files.

```
/bin/rm */.deps/*.*
/bin/rm -f config.cache
aclocal
autoheader
aclocal
automake
autoconf
./configure --with-debug=full --prefix='your installation directory'

# The makefiles generated above need GNU make 3.75 or newer.
# (called gmake below)
gmake clean all install init-db
```

If you run into problems with a new port, you may have to do some debugging of MySQL! See [Section 26.4.1, “Debugging a MySQL Server”](#).

Note

Before you start debugging `mysqld`, first get the test programs `mysys/thr_alarm` and `mysys/thr_lock` to work. This ensures that your thread installation has even a remote chance to work!

26.4.1. Debugging a MySQL Server

If you are using some functionality that is very new in MySQL, you can try to run `mysqld` with the `--skip-new` (which disables all new, potentially unsafe functionality) or with `--safe-mode` which disables a lot of optimization that may cause problems. See [Section B.1.4.2, “What to Do If MySQL Keeps Crashing”](#).

If `mysqld` doesn't want to start, you should verify that you don't have any `my.cnf` files that interfere with your setup! You can check your `my.cnf` arguments with `mysqld --print-defaults` and avoid using them by starting with `mysqld --no-defaults ...`

If `mysqld` starts to eat up CPU or memory or if it “hangs,” you can use `mysqladmin processlist status` to find out if someone is executing a query that takes a long time. It may be a good idea to run `mysqladmin -i10 processlist status` in some window if you are experiencing performance problems or problems when new clients can't connect.

The command `mysqladmin debug` dumps some information about locks in use, used memory and query usage to the MySQL log file. This may help solve some problems. This command also provides some useful information even if you haven't compiled MySQL for debugging!

If the problem is that some tables are getting slower and slower you should try to optimize the table with `OPTIMIZE TABLE` or `myisamchk`. See [Chapter 5, Database Administration](#). You should also check the slow queries with `EXPLAIN`.

You should also read the OS-specific section in this manual for problems that may be unique to your environment. See [Section 2.4.19, “Operating System-Specific Notes”](#).

26.4.1.1. Compiling MySQL for Debugging

If you have some very specific problem, you can always try to debug MySQL. To do this you must configure MySQL with the `--with-debug` or the `--with-debug=full` option. You can check whether MySQL was compiled with debugging by doing: `mysqld --help`. If the `--debug` flag is listed with the options then you have debugging enabled. `mysqladmin ver` also lists the `mysqld` version as `mysql ... --debug` in this case.

If you are using `gcc`, the recommended `configure` line is:

```
CC=gcc CFLAGS="-O2" CXX=gcc CXXFLAGS="-O2 -felide-constructors \
-fno-exceptions -fno-rtti" ./configure --prefix=/usr/local/mysql \
--with-debug --with-extra-charsets=complex
```

This avoids problems with the `libstdc++` library and with C++ exceptions (many compilers have problems with C++ exceptions in threaded code) and compile a MySQL version with support for all character sets.

If you suspect a memory overrun error, you can configure MySQL with `--with-debug=full`, which installs a memory allocation (`SAFEMALLOC`) checker. However, running with `SAFEMALLOC` is quite slow, so if you get performance problems you should start `mysqld` with the `--skip-safemalloc` option. This disables the memory overrun checks for each call to `malloc()` and `free()`.

If `mysqld` stops crashing when you compile it with `--with-debug`, you probably have found a compiler bug or a timing bug within MySQL. In this case, you can try to add `-g` to the `CFLAGS` and `CXXFLAGS` variables above and not use `--with-debug`. If `mysqld` dies, you can at least attach to it with `gdb` or use `gdb` on the core file to find out what happened.

When you configure MySQL for debugging you automatically enable a lot of extra safety check functions that monitor the health of `mysqld`. If they find something “unexpected,” an entry is written to `stderr`, which `mysqld_safe` directs to the error log! This also means that if you are having some unexpected problems with MySQL and are using a source distribution, the first thing you should do is to configure MySQL for debugging! (The second thing is to send mail to a MySQL mailing list and ask for help. See [Section 1.7.1, “MySQL Mailing Lists”](#). If you believe that you have found a bug, please use the instructions at [Section 1.8, “How to Report Bugs or Problems”](#).)

In the Windows MySQL distribution, `mysqld.exe` is by default compiled with support for trace files. See also [Section 26.4.1.2, “Creating Trace Files”](#).

26.4.1.2. Creating Trace Files

If the `mysqld` server doesn't start or if you can cause it to crash quickly, you can try to create a trace file to find the problem.

To do this, you must have a `mysqld` that has been compiled with debugging support. You can check this by executing `mysqld --`

V. If the version number ends with `-debug`, it's compiled with support for trace files. (On Windows, the debugging server is named `mysqld-debug` rather than `mysqld` as of MySQL 4.1.)

Start the `mysqld` server with a trace log in `/tmp/mysqld.trace` on Unix or `C:\mysqld.trace` on Windows:

```
shell> mysqld --debug
```

On Windows, you should also use the `--standalone` flag to not start `mysqld` as a service. In a console window, use this command:

```
C:\> mysqld-debug --debug --standalone
```

After this, you can use the `mysql.exe` command-line tool in a second console window to reproduce the problem. You can stop the `mysqld` server with `mysqladmin shutdown`.

Note that the trace file become **very big**! If you want to generate a smaller trace file, you can use debugging options something like this:

```
mysqld --debug=d,info,error,query,general,where:0,/tmp/mysqld.trace
```

This only prints information with the most interesting tags to the trace file.

If you make a bug report about this, please only send the lines from the trace file to the appropriate mailing list where something seems to go wrong! If you can't locate the wrong place, you can ftp the trace file, together with a full bug report, to <ftp://ftp.mysql.com/pub/mysql/upload/> so that a MySQL developer can take a look at it.

The trace file is made with the **DEBUG** package by Fred Fish. See [Section 26.4.3, "The DEBUG Package"](#).

26.4.1.3. Using `pdb` to create a Windows crashdump

Starting with MySQL 5.0.24 the Program Database files (extension `pdb`) are included in the Noinstall distribution of MySQL. These files provide information for debugging your MySQL installation in the event of a problem.

The PDB file contains more detailed information about `mysqld` and other tools that enables more detailed trace and dump files to be created. You can use these with Dr Watson, `WinDbg` and Visual Studio to debug `mysqld`.

For more information on PDB files, see [Microsoft Knowledge Base Article 121366](#). For more information on the debugging options available, see [Debugging Tools for Windows](#).

Dr Watson is installed with all Windows distributions, but if you have installed Windows development tools, Dr Watson may have been replaced with `WinDbg`, the debugger included with Visual Studio, or the debugging tools provided with Borland or Delphi.

To generate a crash file using Dr Watson, follow these steps:

1. Start Dr Watson by running `drwtsn32.exe` interactively using the `-i` option:

```
C:\> drwtsn32 -i
```

2. Set the **LOG FILE PATH** to the directory where you want to store trace files.
3. Make sure **DUMP ALL THREAD CONTEXTS** and **APPEND TO EXISTING LOG FILE**.
4. Uncheck **DUMP SUMBOL TABLE**, **VISUAL NOTIFICATION**, **SOUND NOTIFICATION** and **CREATE CRASH DUMP FILE**.
5. Set the **NUMBER OF INSTRUCTIONS** to a suitable value to capture enough calls in the stacktrace. A value of at 25 should be enough.

Note that the file generated can be very large.

26.4.1.4. Debugging `mysqld` under `gdb`

On most systems you can also start `mysqld` from `gdb` to get more information if `mysqld` crashes.

With some older `gdb` versions on Linux you must use `run --one-thread` if you want to be able to debug `mysqld` threads. In this case, you can only have one thread active at a time. We recommend you to upgrade to `gdb 5.1` ASAP as thread debugging works much better with this version!

NPTL threads (the new thread library on Linux) may cause problems while running `mysqld` under `gdb`. Some symptoms are:

- `mysqld` hangs during startup (before it writes `ready for connections`).
- `mysqld` crashes during a `pthread_mutex_lock()` or `pthread_mutex_unlock()` call.

In this case, you should set the following environment variable in the shell before starting `gdb`:

```
LD_ASSUME_KERNEL=2.4.1
export LD_ASSUME_KERNEL
```

When running `mysqld` under `gdb`, you should disable the stack trace with `--skip-stack-trace` to be able to catch segfaults within `gdb`.

In MySQL 4.0.14 and above you should use the `--gdb` option to `mysqld`. This installs an interrupt handler for `SIGINT` (needed to stop `mysqld` with `^C` to set breakpoints) and disable stack tracing and core file handling.

It's very hard to debug MySQL under `gdb` if you do a lot of new connections the whole time as `gdb` doesn't free the memory for old threads. You can avoid this problem by starting `mysqld` with `--thread_cache_size='max_connections+1'`. In most cases just using `--thread_cache_size=5` helps a lot!

If you want to get a core dump on Linux if `mysqld` dies with a `SIGSEGV` signal, you can start `mysqld` with the `--core-file` option. This core file can be used to make a backtrace that may help you find out why `mysqld` died:

```
shell> gdb mysqld core
gdb> backtrace full
gdb> quit
```

See [Section B.1.4.2, "What to Do If MySQL Keeps Crashing"](#).

If you are using `gdb` 4.17.x or above on Linux, you should install a `.gdb` file, with the following information, in your current directory:

```
set print sevenbit off
handle SIGUSR1 nostop noprint
handle SIGUSR2 nostop noprint
handle SIGWAITING nostop noprint
handle SIGLWP nostop noprint
handle SIGPIPE nostop
handle SIGALRM nostop
handle SIGHUP nostop
handle SIGTERM nostop noprint
```

If you have problems debugging threads with `gdb`, you should download `gdb` 5.x and try this instead. The new `gdb` version has very improved thread handling!

Here is an example how to debug `mysqld`:

```
shell> gdb /usr/local/libexec/mysqld
gdb> run
...
backtrace full # Do this when mysqld crashes
```

Include the above output in a bug report, which you can file using the instructions in [Section 1.8, "How to Report Bugs or Problems"](#).

If `mysqld` hangs you can try to use some system tools like `strace` or `/usr/proc/bin/pstack` to examine where `mysqld` has hung.

```
strace /tmp/log libexec/mysqld
```

If you are using the Perl `DBI` interface, you can turn on debugging information by using the `trace` method or by setting the `DBI_TRACE` environment variable.

26.4.1.5. Using a Stack Trace

On some operating systems, the error log contains a stack trace if `mysqld` dies unexpectedly. You can use this to find out where (and maybe why) `mysqld` died. See [Section 5.11.1, "The Error Log"](#). To get a stack trace, you must not compile `mysqld` with the `-fomit-frame-pointer` option to `gcc`. See [Section 26.4.1.1, "Compiling MySQL for Debugging"](#).

If the error file contains something like the following:

```
mysqld got signal 11;
The manual section 'Debugging a MySQL server' tells you how to
```

```

use a stack trace and/or the core file to produce a readable
backtrace that may help in finding out why mysqld died
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...
stack range sanity check, ok, backtrace follows
0x40077552
0x81281a0
0x8128f47
0x8127be0
0x8127995
0x8104947
0x80ff28f
0x810131b
0x80ee4bc
0x80c3c91
0x80c6b43
0x80c1fd9
0x80c1686

```

you can find where `mysqld` died by doing the following:

1. Copy the preceding numbers to a file, for example `mysqld.stack`.
2. Make a symbol file for the `mysqld` server:

```
nm -n libexec/mysqld > /tmp/mysqld.sym
```

Note that most MySQL binary distributions (except for the "debug" packages, where this information is included inside of the binaries themselves) ship with the above file, named `mysqld.sym.gz`. In this case, you can simply unpack it by doing:

```
gunzip < bin/mysqld.sym.gz > /tmp/mysqld.sym
```

3. Execute `resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack`.

This prints out where `mysqld` died. If this doesn't help you find out why `mysqld` died, you should make a bug report and include the output from the above command with the bug report.

Note however that in most cases it does not help us to just have a stack trace to find the reason for the problem. To be able to locate the bug or provide a workaround, we would in most cases need to know the query that killed `mysqld` and preferably a test case so that we can repeat the problem! See [Section 1.8, "How to Report Bugs or Problems"](#).

26.4.1.6. Using Server Logs to Find Causes of Errors in `mysqld`

Note that before starting `mysqld` with `--log` you should check all your tables with `myisamchk`. See [Chapter 5, Database Administration](#).

If `mysqld` dies or hangs, you should start `mysqld` with `--log`. When `mysqld` dies again, you can examine the end of the log file for the query that killed `mysqld`.

If you are using `--log` without a file name, the log is stored in the database directory as `host_name.log`. In most cases it is the last query in the log file that killed `mysqld`, but if possible you should verify this by restarting `mysqld` and executing the found query from the `mysql` command-line tools. If this works, you should also test all complicated queries that didn't complete.

You can also try the command `EXPLAIN` on all `SELECT` statements that takes a long time to ensure that `mysqld` is using indexes properly. See [Section 6.2.1, "Optimizing Queries with EXPLAIN"](#).

You can find the queries that take a long time to execute by starting `mysqld` with `--log-slow-queries`. See [Section 5.11.4, "The Slow Query Log"](#).

If you find the text `mysqld restarted` in the error log file (normally named `hostname.err`) you probably have found a query that causes `mysqld` to fail. If this happens, you should check all your tables with `myisamchk` (see [Chapter 5, Database Administration](#)), and test the queries in the MySQL log files to see whether one fails. If you find such a query, try first upgrading to the newest MySQL version. If this doesn't help and you can't find anything in the `mysql` mail archive, you should report the bug to a MySQL mailing list. The mailing lists are described at <http://lists.mysql.com/>, which also has links to online list archives.

If you have started `mysqld` with `myisam-recover`, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file `'Warning: Checking table ...'` which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further. See [Section 5.2.2, "Command Options"](#).

It is not a good sign if `mysqld` did die unexpectedly, but in this case, you should not investigate the `Checking table...` messages, but instead try to find out why `mysqld` died.

26.4.1.7. Making a Test Case If You Experience Table Corruption

If you get corrupted tables or if `mysqld` always fails after some update commands, you can test whether this bug is reproducible by doing the following:

- Take down the MySQL daemon (with `mysqladmin shutdown`).
- Make a backup of the tables (to guard against the very unlikely case that the repair does something bad).
- Check all tables with `myisamchk -s database/* .MYI`. Repair any wrong tables with `myisamchk -r database/table .MYI`.
- Make a second backup of the tables.
- Remove (or move away) any old log files from the MySQL data directory if you need more space.
- Start `mysqld` with `--log-bin`. See Section 5.11.3, “The Binary Log”. If you want to find a query that crashes `mysqld`, you should use `--log --log-bin`.
- When you have gotten a crashed table, stop the `mysqld` server.
- Restore the backup.
- Restart the `mysqld` server **without** `--log-bin`
- Re-execute the commands with `mysqlbinlog binary-log-file | mysql`. The binary log is saved in the MySQL database directory with the name `hostname-bin.#`.
- If the tables are corrupted again or you can get `mysqld` to die with the above command, you have found reproducible bug that should be easy to fix! FTP the tables and the binary log to <ftp://ftp.mysql.com/pub/mysql/upload/> and report it in our bugs database using the instructions given in Section 1.8, “How to Report Bugs or Problems”. (Please note that the `/pub/mysql/upload/` FTP directory is not listable, so you'll not see what you've uploaded in your FTP client.) If you are a support customer, you can use the MySQL Customer Support Center <https://support.mysql.com/> to alert the MySQL team about the problem and have it fixed as soon as possible.

You can also use the script `mysql_find_rows` to just execute some of the update statements if you want to narrow down the problem.

The preceding discussion applies only to RHEL4. The patch is unnecessary for RHEL5.

26.4.2. Debugging a MySQL Client

To be able to debug a MySQL client with the integrated debug package, you should configure MySQL with `--with-debug` or `--with-debug=full`. See Section 2.4.15.2, “Typical configure Options”.

Before running a client, you should set the `MYSQL_DEBUG` environment variable:

```
shell> MYSQL_DEBUG=d:t:O,/tmp/client.trace
shell> export MYSQL_DEBUG
```

This causes clients to generate a trace file in `/tmp/client.trace`.

If you have problems with your own client code, you should attempt to connect to the server and run your query using a client that is known to work. Do this by running `mysql` in debugging mode (assuming that you have compiled MySQL with debugging on):

```
shell> mysql --debug=d:t:O,/tmp/client.trace
```

This provides useful information in case you mail a bug report. See Section 1.8, “How to Report Bugs or Problems”.

If your client crashes at some 'legal' looking code, you should check that your `mysql.h` include file matches your MySQL library file. A very common mistake is to use an old `mysql.h` file from an old MySQL installation with new MySQL library.

26.4.3. The DEBUG Package

The MySQL server and most MySQL clients are compiled with the DBUG package originally created by Fred Fish. When you have configured MySQL for debugging, this package makes it possible to get a trace file of what the program is debugging. See [Section 26.4.1.2, "Creating Trace Files"](#).

This section summarizes the argument values that you can specify in debug options on the command line for MySQL programs that have been built with debugging support. For more information about programming with the DBUG package, see the DBUG manual in the `debug` directory of MySQL source distributions. It's best to use a recent distribution to get the most updated DBUG manual.

You use the debug package by invoking a program with the `--debug="..."` or the `-#...` option.

Most MySQL programs have a default debug string that is used if you don't specify an option to `--debug`. The default trace file is usually `/tmp/program_name.trace` on Unix and `\program_name.trace` on Windows.

The debug control string is a sequence of colon-separated fields as follows:

```
<field_1>:<field_2>:...:<field_N>
```

Each field consists of a mandatory flag character followed by an optional `,` and comma-separated list of modifiers:

```
flag[,modifier,modifier,...,modifier]
```

The currently recognized flag characters are:

Flag	Description
<code>d</code>	Enable output from <code>DEBUG_<N></code> macros for the current state. May be followed by a list of keywords which selects output only for the DBUG macros with that keyword. An empty list of keywords implies output for all macros.
<code>D</code>	Delay after each debugger output line. The argument is the number of tenths of seconds to delay, subject to machine capabilities. For example, <code>-#D,20</code> specifies a delay of two seconds.
<code>f</code>	Limit debugging, tracing, and profiling to the list of named functions. Note that a null list disables all functions. The appropriate <code>d</code> or <code>t</code> flags must still be given; this flag only limits their actions if they are enabled.
<code>F</code>	Identify the source file name for each line of debug or trace output.
<code>i</code>	Identify the process with the PID or thread ID for each line of debug or trace output.
<code>g</code>	Enable profiling. Create a file called <code>debugmon.out</code> containing information that can be used to profile the program. May be followed by a list of keywords that select profiling only for the functions in that list. A null list implies that all functions are considered.
<code>L</code>	Identify the source file line number for each line of debug or trace output.
<code>n</code>	Print the current function nesting depth for each line of debug or trace output.
<code>N</code>	Number each line of debug output.
<code>o</code>	Redirect the debugger output stream to the specified file. The default output is <code>stderr</code> .
<code>O</code>	Like <code>o</code> , but the file is really flushed between each write. When needed, the file is closed and reopened between each write.
<code>p</code>	Limit debugger actions to specified processes. A process must be identified with the <code>DEBUG_PROCESS</code> macro and match one in the list for debugger actions to occur.
<code>P</code>	Print the current process name for each line of debug or trace output.
<code>r</code>	When pushing a new state, do not inherit the previous state's function nesting level. Useful when the output is to start at the left margin.
<code>S</code>	Do function <code>_sanity(_file_,_line_)</code> at each debugged function until <code>_sanity()</code> returns something that differs from 0. (Mostly used with <code>safemalloc</code> to find memory leaks)
<code>t</code>	Enable function call/exit trace lines. May be followed by a list (containing only one modifier) giving a numeric maximum trace level, beyond which no output occurs for either debugging or tracing macros. The default is a compile time option.

Some examples of debug control strings that might appear on a shell command line (the `-#` is typically used to introduce a control string to an application program) are:

```
-#d:t
-#d:f,main,subr1:F:L:t,20
-#d,input,output,files:n
-#d:t:i:0,\mysqld.trace
```

In MySQL, common tags to print (with the `d` option) are `enter`, `exit`, `error`, `warning`, `info`, and `loop`.

26.4.4. Comments about RTS Threads

I have tried to use the RTS thread packages with MySQL but stumbled on the following problems:

They use old versions of many POSIX calls and it is very tedious to make wrappers for all functions. I am inclined to think that it would be easier to change the thread libraries to the newest POSIX specification.

Some wrappers are currently written. See [mysys/my_pthread.c](#) for more info.

At least the following should be changed:

`pthread_get_specific` should use one argument. `sigwait` should take two arguments. A lot of functions (at least `pthread_cond_wait`, `pthread_cond_timedwait()`) should return the error code on error. Now they return -1 and set `errno`.

Another problem is that user-level threads use the `ALRM` signal and this aborts a lot of functions (`read`, `write`, `open`...). MySQL should do a retry on interrupt on all of these but it is not that easy to verify it.

The biggest unsolved problem is the following:

To get thread-level alarms I changed `mysys/thr_alarm.c` to wait between alarms with `pthread_cond_timedwait()`, but this aborts with error `EINTR`. I tried to debug the thread library as to why this happens, but couldn't find any easy solution.

If someone wants to try MySQL with RTS threads I suggest the following:

- Change functions MySQL uses from the thread library to POSIX. This shouldn't take that long.
- Compile all libraries with the `-DHAVE_rts_threads`.
- Compile `thr_alarm`.
- If there are some small differences in the implementation, they may be fixed by changing `my_pthread.h` and `my_pthread.c`.
- Run `thr_alarm`. If it runs without any “warning,” “error,” or aborted messages, you are on the right track. Here is a successful run on Solaris:

```

Main thread: 1
Thread 0 (5) started
Thread: 5 Waiting
process_alarm
Thread 1 (6) started
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 1 (1) sec
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 2 (2) sec
Thread: 6 Simulation of no alarm needed
Thread: 6 Slept for 0 (3) sec
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 4 (4) sec
Thread: 6 Waiting
process_alarm
thread_alarm
Thread: 5 Slept for 10 (10) sec
Thread: 5 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 5 (5) sec
Thread: 6 Waiting
process_alarm
process_alarm
...
thread_alarm
Thread: 5 Slept for 0 (1) sec
end
    
```

26.4.5. Differences Between Thread Packages

MySQL is very dependent on the thread package used. So when choosing a good platform for MySQL, the thread package is very important.

There are at least three types of thread packages:

- User threads in a single process. Thread switching is managed with alarms and the threads library manages all non-thread-safe functions with locks. Read, write and select operations are usually managed with a thread-specific select that switches to another thread if the running threads have to wait for data. If the user thread packages are integrated in the standard libs (FreeBSD and BSDI threads) the thread package requires less overhead than thread packages that have to map all unsafe calls (MIT-pthreads, FSU Pthreads and RTS threads). In some environments (for example, SCO), all system calls are thread-safe so the mapping can be done very easily (FSU Pthreads on SCO). Downside: All mapped calls take a little time and it's quite tricky to be able to handle all situations. There are usually also some system calls that are not handled by the thread package (like MIT-pthreads and sockets). Thread scheduling isn't always optimal.
- User threads in separate processes. Thread switching is done by the kernel and all data are shared between threads. The thread package manages the standard thread calls to allow sharing data between threads. LinuxThreads is using this method. Downside: Lots of processes. Thread creating is slow. If one thread dies the rest are usually left hanging and you must kill them all before restarting. Thread switching is somewhat expensive.
- Kernel threads. Thread switching is handled by the thread library or the kernel and is very fast. Everything is done in one process, but on some systems, `ps` may show the different threads. If one thread aborts, the whole process aborts. Most system calls are thread-safe and should require very little overhead. Solaris, HP-UX, AIX and OSF/1 have kernel threads.

In some systems kernel threads are managed by integrating user level threads in the system libraries. In such cases, the thread switching can only be done by the thread library and the kernel isn't really "thread aware."

Appendix A. MySQL 5.0 Frequently Asked Questions

A.1. MySQL 5.0 FAQ — General

Questions

- [28.1.1](#): When did MySQL 5.0 become production-ready (GA)?

Questions and Answers

28.1.1: When did MySQL 5.0 become production-ready (GA)?

MySQL 5.0.15 was released for production use on 19 October 2005. We are now working on MySQL 5.1, which is currently in beta.

28.1.2: Can MySQL 5.0 do subqueries?

Yes. See [Section 12.2.8](#), “Subquery Syntax”.

28.1.3: Can MySQL 5.0 perform multiple-table inserts, updates, and deletes?

Yes. For the syntax required to perform multiple-table updates, see [Section 12.2.10](#), “UPDATE Syntax”; for that required to perform multiple-table deletes, see [Section 12.2.1](#), “DELETE Syntax”.

A multiple-table insert can be accomplished using a trigger whose `FOR EACH ROW` clause contains multiple `INSERT` statements within a `BEGIN . . . END` block. See [Section 19.3](#), “Using Triggers”.

28.1.4: Does MySQL 5.0 have a Query Cache? Does it work on Server, Instance or Database?

Yes. The query cache operates on the server level, caching complete result sets matched with the original query string. If an exactly identical query is made (which often happens, particularly in web applications), no parsing or execution is necessary; the result is sent directly from the cache. Various tuning options are available. See [Section 6.5.4](#), “The MySQL Query Cache”.

28.1.5: Does MySQL 5.0 have Sequences?

No. However, MySQL has an `AUTO_INCREMENT` system, which in MySQL 5.0 can also handle inserts in a multi-master replication setup. With the `--auto-increment-increment` and `--auto-increment-offset` startup options, you can set each server to generate auto-increment values that don't conflict with other servers. The `--auto-increment-increment` value should be greater than the number of servers, and each server should have a unique offset.

28.1.6: Does MySQL 5.0 have a `NOW()` function with fractions of seconds?

No. This is on the MySQL roadmap as a “rolling feature”. This means that it is not a flagship feature, but will be implemented, development time permitting. Specific customer demand may change this scheduling.

However, MySQL does parse time strings with a fractional component. See [Section 10.3.2](#), “The `TIME` Type”.

28.1.7: Does MySQL 5.0 work with multi-core processors?

Yes. MySQL is fully multi-threaded, and will make use of multiple CPUs, provided that the operating system supports them.

28.1.8: Is there a hot backup tool for MyISAM like InnoDB Hot Backup?

This is currently under development for a future MySQL release.

28.1.9: Have there been there any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?

The foreign key support in [InnoDB](#) has seen improvements in each major version of MySQL. Foreign key support generic to all storage engines is scheduled for MySQL 5.2; this should resolve any inadequacies in the current storage engine specific implementation.

28.1.10: Can MySQL 5.0 perform ACID transactions?

Yes. All current MySQL versions support transactions. The [InnoDB](#) storage engine offers full ACID transactions with row-level locking, multi-versioning, non-locking repeatable reads, and all four SQL standard isolation levels.

The [NDB](#) storage engine supports the [READ COMMITTED](#) transaction isolation level only.

A.2. MySQL 5.0 FAQ — Storage Engines

Questions

- [28.2.1](#): Where can I obtain complete documentation for MySQL storage engines?
- [28.2.2](#): Are there any new storage engines in MySQL 5.0?
- [28.2.3](#): Have any storage engines been removed in MySQL 5.0?
- [28.2.4](#): What are the unique benefits of the [ARCHIVE](#) storage engine?
- [28.2.5](#): Do the new features in MySQL 5.0 apply to all storage engines?

Questions and Answers

28.2.1: Where can I obtain complete documentation for MySQL storage engines?

See [Chapter 13, *Storage Engines*](#). That chapter contains information about all MySQL storage engines except for the [NDB](#) storage engine used for MySQL Cluster; [NDB](#) is covered in [Chapter 16, *MySQL Cluster*](#).

28.2.2: Are there any new storage engines in MySQL 5.0?

Yes. The [FEDERATED](#) storage engine, new in MySQL 5.0, allows the server to access tables on other (remote) servers. See [Section 13.7, “The \[FEDERATED\]\(#\) Storage Engine”](#).

28.2.3: Have any storage engines been removed in MySQL 5.0?

Yes. MySQL 5.0 no longer supports the [ISAM](#) storage engine. If you have any existing [ISAM](#) tables from previous versions of MySQL, you should convert these to [MyISAM](#) before upgrading to MySQL 5.0.

28.2.4: What are the unique benefits of the [ARCHIVE](#) storage engine?

The [ARCHIVE](#) storage engine is ideally suited for storing large amounts of data without indexes; it has a very small footprint, and performs selects using table scans. See [Section 13.8, “The \[ARCHIVE\]\(#\) Storage Engine”](#), for details.

28.2.5: Do the new features in MySQL 5.0 apply to all storage engines?

The general new features such as views, stored procedures, triggers, [INFORMATION_SCHEMA](#), precision math ([DECIMAL](#) column type), and the [BIT](#) column type, apply to all storage engines. There are also additions and changes for specific storage engines.

A.3. MySQL 5.0 FAQ — Server SQL Mode

Questions

- [28.3.1](#): What are server SQL modes?

- [28.3.2](#): How many server SQL modes are there?
- [28.3.3](#): How do you determine the server SQL mode?
- [28.3.4](#): Is the mode dependent on the database or connection?
- [28.3.5](#): Can the rules for strict mode be extended?
- [28.3.6](#): Does strict mode impact performance?
- [28.3.7](#): What is the default server SQL mode when MySQL 5.0 is installed?

Questions and Answers

28.3.1: What are server SQL modes?

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server apply these modes individually to different clients. For more information, see [Section 5.2.6, “SQL Modes”](#).

28.3.2: How many server SQL modes are there?

Each mode can be independently switched on and off. See [Section 5.2.6, “SQL Modes”](#), for a complete list of available modes.

28.3.3: How do you determine the server SQL mode?

You can set the default SQL mode (for `mysqld` startup) with the `--sql-mode` option. Using the statement `SET [SESSION|GLOBAL] sql_mode='modes'`, you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a `SELECT @@sql_mode` statement.

28.3.4: Is the mode dependent on the database or connection?

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. you can change these settings using `SET [SESSION|GLOBAL] sql_mode='modes'`.

28.3.5: Can the rules for strict mode be extended?

When we refer to *strict mode*, we mean a mode where at least one of the modes `TRADITIONAL`, `STRICT_TRANS_TABLES`, or `STRICT_ALL_TABLES` is enabled. Options can be combined, so you can add additional restrictions to a mode. See [Section 5.2.6, “SQL Modes”](#), for more information.

28.3.6: Does strict mode impact performance?

The intensive validation of input data that some settings requires more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However — if you do require it — strict mode can provide such validation.

28.3.7: What is the default server SQL mode when MySQL 5.0 is installed?

By default, no special modes are enabled. See [Section 5.2.6, “SQL Modes”](#), for information about all available modes and MySQL's default behavior.

A.4. MySQL 5.0 FAQ — Stored Procedures

Questions

- [28.4.1](#): Does MySQL 5.0 support stored procedures?
- [28.4.2](#): Where can I find documentation for MySQL stored procedures and stored functions?
- [28.4.3](#): Is there a discussion forum for MySQL stored procedures?
- [28.4.4](#): Where can I find the ANSI SQL 2003 specification for stored procedures?
- [28.4.5](#): How do you manage stored routines?
- [28.4.6](#): Is there a way to view all stored procedures and stored functions in a given database?

- [28.4.7](#): Where are stored procedures stored?
- [28.4.8](#): Is it possible to group stored procedures or stored functions into packages?
- [28.4.9](#): Can a stored procedure call another stored procedure?
- [28.4.10](#): Can a stored procedure call a trigger?
- [28.4.11](#): Can a stored procedure access tables?
- [28.4.12](#): Do stored procedures have a statement for raising application errors?
- [28.4.13](#): Do stored procedures provide exception handling?
- [28.4.14](#): Can MySQL 5.0 stored routines return result sets?
- [28.4.15](#): Is `WITH RECOMPILE` supported for stored procedures?
- [28.4.16](#): Is there a MySQL equivalent to using `mod_php` as a gateway on Apache to talk directly to a stored procedure in the database?
- [28.4.17](#): Can I pass an array as input to a stored procedure?
- [28.4.18](#): Can I pass a cursor as an `IN` parameter to a stored procedure?
- [28.4.19](#): Can I return a cursor as an `OUT` parameter from a stored procedure?
- [28.4.20](#): Can I print out a variable's value within a stored routine for debugging purposes?
- [28.4.21](#): Can I commit or roll back transactions inside a stored procedure?
- [28.4.22](#): Do MySQL 5.0 stored procedures and functions work with replication?
- [28.4.23](#): Are stored procedures and functions created on a master server replicated to a slave?
- [28.4.24](#): How are actions that take place inside stored procedures and functions replicated?
- [28.4.25](#): Are there special security requirements for using stored procedures and functions together with replication?
- [28.4.26](#): What limitations exist for replicating stored procedure and function actions?
- [28.4.27](#): Do the preceding limitations affect MySQL's ability to do point-in-time recovery?
- [28.4.28](#): What is being done to correct the aforementioned limitations?

Questions and Answers

28.4.1: Does MySQL 5.0 support stored procedures?

Yes. MySQL 5.0 supports two types of stored routines — stored procedures and stored functions.

28.4.2: Where can I find documentation for MySQL stored procedures and stored functions?

See [Chapter 18, *Stored Procedures and Functions*](#).

28.4.3: Is there a discussion forum for MySQL stored procedures?

Yes. See <http://forums.mysql.com/list.php?98>.

28.4.4: Where can I find the ANSI SQL 2003 specification for stored procedures?

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books — such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer — which give a comprehensive overview of the standard, including coverage of stored procedures.

28.4.5: How do you manage stored routines?

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with `CREATE [FUNCTION|PROCEDURE]`, `ALTER [FUNCTION|PROCEDURE]`, `DROP [FUNCTION|PROCEDURE]`, and `SHOW CREATE [FUNCTION|PROCEDURE]`. You can obtain information about existing stored procedures using the `ROUTINES` table in the `INFORMATION_SCHEMA` database (see [Section 21.14, “The `INFORMATION_SCHEMA` `ROUTINES` Table](#)”).

28.4.6: Is there a way to view all stored procedures and stored functions in a given database?

Yes. For a database named *dbname*, use this query on the `INFORMATION_SCHEMA.ROUTINES` table:

```
SELECT ROUTINE_TYPE, ROUTINE_NAME
FROM INFORMATION_SCHEMA.ROUTINES
WHERE ROUTINE_SCHEMA= 'dbname' ;
```

For more information, see [Section 21.14, “The INFORMATION_SCHEMA ROUTINES Table”](#).

The body of a stored routine can be viewed using `SHOW CREATE FUNCTION` (for a stored function) or `SHOW CREATE PROCEDURE` (for a stored procedure). See [Section 12.5.4.5, “SHOW CREATE PROCEDURE and SHOW CREATE FUNCTION Syntax”](#), for more information.

28.4.7: Where are stored procedures stored?

In the `proc` table of the `mysql` system database. However, you should not access the tables in the system database directly. Instead, use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See [Section 12.5.4.5, “SHOW CREATE PROCEDURE and SHOW CREATE FUNCTION Syntax”](#), for more information about these statements.

You can also query the `ROUTINES` table in the `INFORMATION_SCHEMA` database — see [Section 21.14, “The INFORMATION_SCHEMA ROUTINES Table”](#), for information about this table.

28.4.8: Is it possible to group stored procedures or stored functions into packages?

No. This is not supported in MySQL 5.0.

28.4.9: Can a stored procedure call another stored procedure?

Yes.

28.4.10: Can a stored procedure call a trigger?

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to fire.

28.4.11: Can a stored procedure access tables?

Yes. A stored procedure can access one or more tables as required.

28.4.12: Do stored procedures have a statement for raising application errors?

Not in MySQL 5.0. We intend to implement the SQL standard `SIGNAL` and `RESIGNAL` statements in a future MySQL release.

28.4.13: Do stored procedures provide exception handling?

MySQL implements `HANDLER` definitions according to the SQL standard. See [Section 18.2.8.2, “DECLARE Handlers”](#), for details.

28.4.14: Can MySQL 5.0 stored routines return result sets?

Stored procedures can, but stored functions cannot. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or above) client-server protocol for this to work. This means that — for instance — in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

28.4.15: Is `WITH RECOMPILE` supported for stored procedures?

Not in MySQL 5.0.

28.4.16: Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?

There is no equivalent in MySQL 5.0.

28.4.17: Can I pass an array as input to a stored procedure?

Not in MySQL 5.0.

28.4.18: Can I pass a cursor as an `IN` parameter to a stored procedure?

In MySQL 5.0, cursors are available inside stored procedures only.

28.4.19: Can I return a cursor as an `OUT` parameter from a stored procedure?

In MySQL 5.0, cursors are available inside stored procedures only. However, if you do not open a cursor on a `SELECT`, the result will be sent directly to the client. You can also `SELECT INTO` variables. See [Section 12.2.7, “SELECT Syntax”](#).

28.4.20: Can I print out a variable's value within a stored routine for debugging purposes?

Yes, you can do this in a *stored procedure*, but not in a stored function. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You will need to use the MySQL 4.1 (or above) client-server protocol for this to work. This means that — for instance — in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

28.4.21: Can I commit or roll back transactions inside a stored procedure?

Yes. However, you cannot perform transactional operations within a stored function.

28.4.22: Do MySQL 5.0 stored procedures and functions work with replication?

Yes, standard actions carried out in stored procedures and functions are replicated from a master MySQL server to a slave server. There are a few limitations that are described in detail in [Section 18.4, “Binary Logging of Stored Routines and Triggers”](#).

28.4.23: Are stored procedures and functions created on a master server replicated to a slave?

Yes, creation of stored procedures and functions carried out through normal DDL statements on a master server are replicated to a slave, so the objects will exist on both servers. `ALTER` and `DROP` statements for stored procedures and functions are also replicated.

28.4.24: How are actions that take place inside stored procedures and functions replicated?

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a slave server. The actual calls made to execute stored procedures are not replicated.

Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

28.4.25: Are there special security requirements for using stored procedures and functions together with replication?

Yes. Because a slave server has authority to execute any statement read from a master's binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active, then MySQL DBAs have two security options open to them:

1. Any user wishing to create stored functions must be granted the `SUPER` privilege.
2. Alternatively, a DBA can set the `log_bin_trust_function_creators` system variable to 1, which enables anyone with the standard `CREATE ROUTINE` privilege to create stored functions.

28.4.26: What limitations exist for replicating stored procedure and function actions?

Non-deterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced, and therefore, random actions replicated to a slave will not mirror those performed on a master. Note that declaring stored functions to be `DETERMINISTIC` or setting the `log_bin_trust_function_creators` system variable to 0 will not allow random-valued operations to be invoked.

In addition, time-based actions cannot be reproduced on a slave because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, non-transactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a master may be partially updated from DML activity, but no updates are done to the slave because of the errors that occurred. A workaround is for a function's DML actions to be carried out with the `IGNORE` keyword so that updates on the master that cause errors are ignored and updates that do not cause errors are replicated to the slave.

28.4.27: Do the preceding limitations affect MySQL's ability to do point-in-time recovery?

The same limitations that affect replication do affect point-in-time recovery.

28.4.28: What is being done to correct the aforementioned limitations?

MySQL 5.1 implements *row-based replication*, which resolves the limitations mentioned earlier.

We do not plan to backport row-based replication to MySQL 5.0. For additional information, see [Row-Based Replication, in the MySQL 5.1 Manual](#).

A.5. MySQL 5.0 FAQ — Triggers

Questions

- [28.5.1](#): Where can I find the documentation for MySQL 5.0 triggers?
- [28.5.2](#): Is there a discussion forum for MySQL Triggers?
- [28.5.3](#): Does MySQL 5.0 have statement-level or row-level triggers?
- [28.5.4](#): Are there any default triggers?
- [28.5.5](#): How are triggers managed in MySQL?
- [28.5.6](#): Is there a way to view all triggers in a given database?
- [28.5.7](#): Where are triggers stored?
- [28.5.8](#): Can a trigger call a stored procedure?
- [28.5.9](#): Can triggers access tables?
- [28.5.10](#): Can triggers call an external application through a UDF?
- [28.5.11](#): Is possible for a trigger to update tables on a remote server?
- [28.5.12](#): Do triggers work with replication?
- [28.5.13](#): How are actions carried out through triggers on a master replicated to a slave?

Questions and Answers

28.5.1: Where can I find the documentation for MySQL 5.0 triggers?

See [Chapter 19, Triggers](#).

28.5.2: Is there a discussion forum for MySQL Triggers?

Yes. It is available at <http://forums.mysql.com/list.php?99>.

28.5.3: Does MySQL 5.0 have statement-level or row-level triggers?

In MySQL 5.0, all triggers are `FOR EACH ROW` — that is, the trigger is activated for each row that is inserted, updated, or deleted. MySQL 5.0 does not support triggers using `FOR EACH STATEMENT`.

28.5.4: Are there any default triggers?

Not explicitly. MySQL does have specific special behavior for some `TIMESTAMP` columns, as well as for columns which are defined using `AUTO_INCREMENT`.

28.5.5: How are triggers managed in MySQL?

In MySQL 5.0, triggers can be created using the `CREATE TRIGGER` statement, and dropped using `DROP TRIGGER`. See [Section 19.1, “CREATE TRIGGER Syntax”](#), and [Section 19.2, “DROP TRIGGER Syntax”](#), for more about these statements.

Information about triggers can be obtained by querying the `INFORMATION_SCHEMA.TRIGGERS` table. See [Section 21.16, “The INFORMATION_SCHEMA TRIGGERS Table”](#).

28.5.6: Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database `dbname` using a query on the `INFORMATION_SCHEMA.TRIGGERS` table such as the one shown here:

```
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
FROM INFORMATION_SCHEMA.TRIGGERS
WHERE TRIGGER_SCHEMA='dbname';
```

For more information about this table, see [Section 21.16, “The INFORMATION_SCHEMA TRIGGERS Table”](#).

You can also use the `SHOW TRIGGERS` statement, which is specific to MySQL. See [Section 12.5.4.26, “SHOW TRIGGERS Syntax”](#).

28.5.7: Where are triggers stored?

Triggers are currently stored in `.TRG` files, with one such file one per table. In other words, a trigger belongs to a table.

In the future, we plan to change this so that trigger information will be included in the `.FRM` file that defines the structure of the table. We also plan to make triggers database-level objects — rather than table-level objects as they are now — to bring them into compliance with the SQL standard.

28.5.8: Can a trigger call a stored procedure?

Yes.

28.5.9: Can triggers access tables?

A trigger can access both old and new data in its own table. Through a stored procedure, or a multiple-table update or delete statement, a trigger can also affect other tables.

28.5.10: Can triggers call an external application through a UDF?

No, not at present.

28.5.11: Is possible for a trigger to update tables on a remote server?

Yes. A table on a remote server could be updated using the `FEDERATED` storage engine. (See [Section 13.7, “The FEDERATED Storage Engine”](#)).

28.5.12: Do triggers work with replication?

Triggers and replication in MySQL 5.0 work in the same way as in most other database engines: Actions carried out through triggers on a master are not replicated to a slave server. Instead, triggers that exist on tables that reside on a MySQL master server need to be created on the corresponding tables on any MySQL slave servers so that the triggers activate on the slaves as well as the master.

28.5.13: How are actions carried out through triggers on a master replicated to a slave?

First, the triggers that exist on a master must be re-created on the slave server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table `EMP` that has an `AFTER` insert trigger, which exists on a master MySQL server. The same `EMP` table and `AFTER` insert trigger exist on the slave server as well. The replication flow would be:

1. An `INSERT` statement is made to `EMP`.
2. The `AFTER` trigger on `EMP` activates.
3. The `INSERT` statement is written to the binary log.
4. The replication slave picks up the `INSERT` statement to `EMP` and executes it.
5. The `AFTER` trigger on `EMP` that exists on the slave activates.

A.6. MySQL 5.0 FAQ — Views

Questions

- [28.6.1](#): Where can I find documentation covering MySQL Views?
- [28.6.2](#): Is there a discussion forum for MySQL Views?
- [28.6.3](#): What happens to a view if an underlying table is dropped or renamed?
- [28.6.4](#): Does MySQL 5.0 have table snapshots?
- [28.6.5](#): Does MySQL 5.0 have materialized views?
- [28.6.6](#): Can you insert into views that are based on joins?

Questions and Answers

28.6.1: Where can I find documentation covering MySQL Views?

See [Chapter 20, Views](#).

28.6.2: Is there a discussion forum for MySQL Views?

Yes. See <http://forums.mysql.com/list.php?100>

28.6.3: What happens to a view if an underlying table is dropped or renamed?

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the `CHECK TABLE` statement. (See [Section 12.5.2.3, “CHECK TABLE Syntax”](#).)

28.6.4: Does MySQL 5.0 have table snapshots?

No.

28.6.5: Does MySQL 5.0 have materialized views?

No.

28.6.6: Can you insert into views that are based on joins?

It is possible, provided that your `INSERT` statement has a column list that makes it clear there's only one table involved.

You *cannot* insert into multiple tables with a single insert on a view.

A.7. MySQL 5.0 FAQ — [INFORMATION_SCHEMA](#)

Questions

- [28.7.1](#): Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?
- [28.7.2](#): Is there a discussion forum for `INFORMATION_SCHEMA`?
- [28.7.3](#): Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?
- [28.7.4](#): What is the difference between the Oracle Data Dictionary and MySQL's `INFORMATION_SCHEMA`?
- [28.7.5](#): Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

Questions and Answers

28.7.1: Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?

See [Chapter 21, The `INFORMATION_SCHEMA` Database](#)

28.7.2: Is there a discussion forum for `INFORMATION_SCHEMA`?

See <http://forums.mysql.com/list.php?101>.

28.7.3: Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available — such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer — which give a comprehensive overview of the standard, including `INFORMATION_SCHEMA`.

28.7.4: What is the difference between the Oracle Data Dictionary and MySQL's `INFORMATION_SCHEMA`?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. MySQL's implementation is more similar to those found in DB2 and SQL Server, which also support `INFORMATION_SCHEMA` as defined in the SQL standard.

28.7.5: Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, *MySQL AB cannot support bugs or other issues which result from modifying `INFORMATION_SCHEMA` tables or data.*

A.8. MySQL 5.0 FAQ — Migration

Questions

- [28.8.1](#): Where can I find information on how to migrate from MySQL 4.1 to MySQL 5.0?
- [28.8.2](#): How has storage engine (table type) support changed in MySQL 5.0 from previous versions?

Questions and Answers

28.8.1: Where can I find information on how to migrate from MySQL 4.1 to MySQL 5.0?

For detailed upgrade information, see [Section 2.4.17, “Upgrading MySQL”](#). We recommend that you do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major version to the next in each step. This may seem more complicated, but it will you save time and trouble — if you encounter problems during the upgrade, their origin will be easier to identify, either by you or — if you have a MySQL Enterprise subscription — by MySQL support.

28.8.2: How has storage engine (table type) support changed in MySQL 5.0 from previous versions?

Storage engine support has changed as follows:

- Support for [ISAM](#) tables was removed in MySQL 5.0 and you should now use the [MyISAM](#) storage engine in place of [ISAM](#). To convert a table `tblname` from [ISAM](#) to [MyISAM](#), simply issue a statement such as this one:

```
ALTER TABLE tblname ENGINE=MYISAM;
```

- Internal [RAID](#) for [MyISAM](#) tables was also removed in MySQL 5.0. This was formerly used to allow large tables in file systems that did not support file sizes greater than 2GB. All modern file systems allow for larger tables; in addition, there are now other solutions such as [MERGE](#) tables and views.
- The [VARCHAR](#) column type now retains trailing spaces in all storage engines.
- [MEMORY](#) tables (formerly known as [HEAP](#) tables) can also contain [VARCHAR](#) columns.

A.9. MySQL 5.0 FAQ — Security

Questions

- [28.9.1](#): Where can I find documentation that addresses security issues for MySQL?
- [28.9.2](#): Does MySQL 5.0 have native support for SSL?
- [28.9.3](#): Is SSL support be built into MySQL binaries, or must I recompile the binary myself to enable it?
- [28.9.4](#): Does MySQL 5.0 have built-in authentication against LDAP directories?
- [28.9.5](#): Does MySQL 5.0 include support for Roles Based Access Control (RBAC)?

Questions and Answers

28.9.1: Where can I find documentation that addresses security issues for MySQL?

The best place to start is [Section 5.6, “General Security Issues”](#).

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- [Section 5.6.1, “General Security Guidelines”](#).
- [Section 5.6.2, “Making MySQL Secure Against Attackers”](#).
- [Section B.1.4.1, “How to Reset the Root Password”](#).
- [Section 5.6.5, “How to Run MySQL as a Normal User”](#).

- [Section 26.2.4.6, “User-Defined Function Security Precautions”](#).
- [Section 5.6.3, “Security-Related `mysqld` Options”](#).
- [Section 5.6.4, “Security Issues with `LOAD DATA LOCAL`”](#).
- [Section 2.4.16, “Post-Installation Setup and Testing”](#).
- [Section 2.4.19.1.11, “SELinux Notes”](#).
- [Section 5.8.7.1, “Basic SSL Concepts”](#).

MySQL Enterprise

The MySQL Enterprise Monitor enforces best practices for maximizing the security of your servers. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

28.9.2: Does MySQL 5.0 have native support for SSL?

Most 5.0 binaries have support for SSL connections between the client and server. We can't currently build with the new YaSSL library everywhere, as it's still quite new and does not compile on all platforms yet. See [Section 5.8.7, “Using Secure Connections”](#).

You can also tunnel a connection via SSH, if (for instance) if the client application doesn't support SSL connections. For an example, see [Section 5.8.7.5, “Connecting to MySQL Remotely from Windows with SSH”](#).

28.9.3: Is SSL support be built into MySQL binaries, or must I recompile the binary myself to enable it?

Most 5.0 binaries have SSL enabled for client-server connections that are secured, authenticated, or both. However, the YaSSL library currently does not compile on all platforms. See [Section 5.8.7, “Using Secure Connections”](#), for a complete listing of supported and unsupported platforms.

28.9.4: Does MySQL 5.0 have built-in authentication against LDAP directories?

No. Support for external authentication methods is on the MySQL roadmap as a “rolling feature”, which means that we plan to implement it in the future, but we have not yet determined when this will be done.

28.9.5: Does MySQL 5.0 include support for Roles Based Access Control (RBAC)?

No. Support for roles is on the MySQL roadmap as a “rolling feature”, which means that we plan to implement it in the future, but we have not yet determined when this will be done.

A.10. MySQL 5.0 FAQ — MySQL Cluster

In the following section, we provide answers to questions that are most frequently asked about MySQL Cluster and the [NDB](#) storage engine.

Questions

- [28.10.1](#): What does “NDB” mean?
- [28.10.2](#): What's the difference in using Cluster vs using replication?
- [28.10.3](#): Do I need to do any special networking to run Cluster? How do computers in a cluster communicate?
- [28.10.4](#): How many computers do I need to run a cluster, and why?
- [28.10.5](#): What do the different computers do in a MySQL Cluster?

Questions and Answers

28.10.1: What does “NDB” mean?

This stands for “Network Database”. `NDB` (also known as `NDB Cluster` or `NDBCLUSTER`) is the storage engine that enables clustering in MySQL.

28.10.2: What's the difference in using Cluster vs using replication?

In a replication setup, a master MySQL server updates one or more slaves. Transactions are committed sequentially, and a slow transaction can cause the slave to lag behind the master. This means that if the master fails, it is possible that the slave might not have recorded the last few transactions. If a transaction-safe engine such as `InnoDB` is being used, a transaction will either be complete on the slave or not applied at all, but replication does not guarantee that all data on the master and the slave will be consistent at all times. In MySQL Cluster, all data nodes are kept in synchrony, and a transaction committed by any one data node is committed for all data nodes. In the event of a data node failure, all remaining data nodes remain in a consistent state.

In short, whereas standard MySQL replication is asynchronous, MySQL Cluster is synchronous.

We have implemented (asynchronous) replication for Cluster in MySQL 5.1. This includes the capability to replicate both between two clusters, and from a MySQL cluster to a non-Cluster MySQL server. However, we do not plan to backport this functionality to

MySQL 5.0.

28.10.3: Do I need to do any special networking to run Cluster? How do computers in a cluster communicate?

MySQL Cluster is intended to be used in a high-bandwidth environment, with computers connecting via TCP/IP. Its performance depends directly upon the connection speed between the cluster's computers. The minimum connectivity requirements for Cluster include a typical 100-megabit Ethernet network or the equivalent. We recommend you use gigabit Ethernet whenever available.

The faster SCI protocol is also supported, but requires special hardware. See [Section 16.9, "Using High-Speed Interconnects with MySQL Cluster"](#), for more information about SCI.

28.10.4: How many computers do I need to run a cluster, and why?

A minimum of three computers is required to run a viable cluster. However, the minimum **recommended** number of computers in a MySQL Cluster is four: one each to run the management and SQL nodes, and two computers to serve as data nodes. The purpose of the two data nodes is to provide redundancy; the management node must run on a separate machine to guarantee continued arbitration services in the event that one of the data nodes fails.

To provide increased throughput and high availability, you should use multiple SQL nodes (MySQL Servers connected to the cluster). It is also possible (although not strictly necessary) to run multiple management servers.

28.10.5: What do the different computers do in a MySQL Cluster?

A MySQL Cluster has both a physical and logical organization, with computers being the physical elements. The logical or functional elements of a cluster are referred to as *nodes*, and a computer housing a cluster node is sometimes referred to as a *cluster host*. There are three types of nodes, each corresponding to a specific role within the cluster. These are:

- **Management node (MGM node):** Provides management services for the cluster as a whole, including startup, shutdown, backups, and configuration data for the other nodes. The management node server is implemented as the application `ndb_mgmd`; the management client used to control MySQL Cluster via the MGM node is `ndb_mgm`.
- **Data node:** Stores and replicates data. Data node functionality is handled by an instance of the NDB data node process `ndbd`.
- **SQL node:** This is simply an instance of MySQL Server (`mysqld`) that is built with support for the `NDB Cluster` storage engine and started with the `--ndb-cluster` option to enable the engine.

28.10.6: With which operating systems can I use Cluster?

MySQL Cluster is supported on most Unix-like operating systems, including Linux, Mac OS X, Solaris, BSD, HP-UX, AIX, and IRIX, among others, as well as Novell Netware. Cluster is not supported for Windows at this time. However, we are working to add Cluster support for other platforms, including Windows, and our goal is to offer MySQL Cluster on all platforms for which MySQL itself is supported.

For more detailed information concerning the level of support which is offered for MySQL Cluster on various operating system versions, OS distributions, and hardware platforms, please refer to <http://www.mysql.com/support/supportedplatforms/cluster.html>.

28.10.7: What are the hardware requirements for running MySQL Cluster?

Cluster should run on any platform for which NDB-enabled binaries are available. Naturally, faster CPUs and more memory will improve performance, and 64-bit CPUs will likely be more effective than 32-bit processors. There must be sufficient memory on machines used for data nodes to hold each node's share of the database (see *How much RAM do I Need?* for more information). Nodes can communicate via a standard TCP/IP network and hardware. For SCI support, special networking hardware is required.

28.10.8: How much RAM do I need? Is it possible to use disk memory at all?

In MySQL-5.0, Cluster is in-memory only. This means that all table data (including indexes) is stored in RAM. Therefore, if your data takes up 1GB of space and you want to replicate it once in the cluster, you need 2GB of memory to do so (1 GB per replica). This is in addition to the memory required by the operating system and any applications running on the cluster computers.

If a data node's memory usage exceeds what is available in RAM, then the system will attempt to use swap space up to the limit set for `DataMemory`. However, this will at best result in severely degraded performance, and may cause the node to be dropped due to slow response time (missed heartbeats). We do not recommend on relying on disk swapping in a production environment for this reason. In any case, once the `DataMemory` limit is reached, any operations requiring additional memory (such as inserts) will fail.

(We have implemented disk data storage for MySQL Cluster in MySQL 5.1, but we have no plans to add this capability in MySQL 5.0.)

You can use the following formula for obtaining a rough estimate of how much RAM is needed for each data node in the cluster:

```
(SizeofDatabase × NumberOfReplicas × 1.1 ) / NumberOfDataNodes
```

To calculate the memory requirements more exactly requires determining, for each table in the cluster database, the storage space required per row (see [Section 10.5, “Data Type Storage Requirements”](#), for details), and multiplying this by the number of rows. You must also remember to account for any column indexes as follows:

- Each primary key or hash index created for an `NDBCluster` table requires 21–25 bytes per record. These indexes use `IndexMemory`.
- Each ordered index requires 10 bytes storage per record, using `DataMemory`.
- Creating a primary key or unique index also creates an ordered index, unless this index is created with `USING HASH`. In other words:
 - A primary key or unique index on a Cluster table normally takes up 31 to 35 bytes per record.
 - However, if the primary key or unique index is created with `USING HASH`, then it requires only 21 to 25 bytes per record.

Note that creating MySQL Cluster tables with `USING HASH` for all primary keys and unique indexes will generally cause table updates to run more quickly — in some cases by a much as 20 to 30 percent faster than updates on tables where `USING HASH` was not used in creating primary and unique keys. This is due to the fact that less memory is required (because no ordered indexes are created), and that less CPU must be utilized (because fewer indexes must be read and possibly updated). However, it also means that queries that could otherwise use range scans must be satisfied by other means, which can result in slower selects.

When calculating Cluster memory requirements, you may find useful the `ndb_size.pl` utility which is available in recent MySQL 5.0 releases. This Perl script connects to a current (non-Cluster) MySQL database and creates a report on how much space that database would require if it used the `NDBCluster` storage engine. For more information, see [Section 16.8.14, “ndb_size.pl — NDBCluster Size Requirement Estimator”](#).

It is especially important to keep in mind that *every MySQL Cluster table must have a primary key*. The `NDB` storage engine creates a primary key automatically if none is defined, and this primary key is created without `USING HASH`.

There is no easy way to determine exactly how much memory is being used for storage of Cluster indexes at any given time; however, warnings are written to the Cluster log when 80% of available `DataMemory` or `IndexMemory` is in use, and again when use reaches 85%, 90%, and so on.

28.10.9: What filesystems can I use with MySQL Cluster? What about network filesystems or network shares?

Generally, any filesystem that is native to the host operating system should work well with MySQL Cluster. If you find that a given filesystem works particularly well (or not so especially well) with MySQL Cluster, we invite you to discuss your findings in the [MySQL Cluster Forums](#).

We do not test MySQL Cluster with `FAT` or `VFAT` filesystems on Linux. Because of this, and due to the fact that these are not very useful for any purpose other than sharing disk partitions between Linux and Windows operating systems on multi-boot computers, we do not recommend their use with MySQL Cluster.

MySQL Cluster is implemented as a shared-nothing solution; the idea behind this is that the failure of a single piece of hardware should not cause the failure of multiple cluster nodes, or possibly even the failure of the cluster as a whole. For this reason, the use of network shares or network filesystems is not supported for MySQL Cluster. This also applies to shared storage devices such as SANs.

28.10.10: Can I run MySQL Cluster nodes inside virtual machines (such as those created by VMWare, Parallels, or Xen)?

This is possible but not recommended for a production environment.

We have found that running MySQL Cluster processes inside a virtual machine can give rise to issues with timing and disk subsystems that have a strong negative impact on the operation of the cluster. The behavior of the cluster is often unpredictable in these cases.

If the issue can be reproduced outside the virtual environment, then we may be able to provide assistance. Otherwise, we cannot support it at this time.

28.10.11: I'm trying to populate a Cluster database. The loading process terminates prematurely and I get an error message like this one:

```
ERROR 1114: THE TABLE 'MY_CLUSTER_TABLE' IS FULL
```

Why is this happening?

The cause is very likely to be that your setup does not provide sufficient RAM for all table data and all indexes, *including the*

primary key required by the [NDB](#) storage engine and automatically created in the event that the table definition does not include the definition of a primary key.

It is also worth noting that all data nodes should have the same amount of RAM, since no data node in a cluster can use more memory than the least amount available to any individual data node. In other words, if there are four computers hosting Cluster data nodes, and three of these have 3GB of RAM available to store Cluster data while the remaining data node has only 1GB RAM, then each data node can devote only 1GB to clustering.

28.10.12: MySQL Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or more nodes in remote locations?

It is *very* unlikely that a cluster would perform reliably under such conditions, as MySQL Cluster was designed and implemented with the assumption that it would be run under conditions guaranteeing dedicated high-speed connectivity such as that found in a LAN setting using 100 Mbps or gigabit Ethernet — preferably the latter. We neither test nor warrant its performance using anything slower than this.

Also, it is extremely important to keep in mind that communications between the nodes in a MySQL Cluster are not secure; they are neither encrypted nor safeguarded by any other protective mechanism. The most secure configuration for a cluster is in a private network behind a firewall, with no direct access to any Cluster data or management nodes from outside. (For SQL nodes, you should take the same precautions as you would with any other instance of the MySQL server.)

28.10.13: Do I have to learn a new programming or query language to use MySQL Cluster?

No. Although some specialized commands are used to manage and configure the cluster itself, only standard (My)SQL queries and commands are required for the following operations:

- Creating, altering, and dropping tables
- Inserting, updating, and deleting table data
- Creating, changing, and dropping primary and unique indexes

Some specialized configuration parameters and files are required to set up a MySQL Cluster — see [Section 16.3.4, “Configuration File”](#), for information about these.

A few simple commands are used in the MySQL Cluster management client for tasks such as starting and stopping cluster nodes. See [Section 16.6.2, “Commands in the MySQL Cluster Management Client”](#).

28.10.14: How do I find out what an error or warning message means when using MySQL Cluster?

There are two ways in which this can be done:

- From within the `mysql` client, use `SHOW ERRORS` or `SHOW WARNINGS` immediately upon being notified of the error or warning condition. Errors and warnings also be displayed in MySQL Query Browser.
- From a system shell prompt, use `pererror --ndb error_code`.

28.10.15: Is MySQL Cluster transaction-safe? What isolation levels are supported?

Yes: For tables created with the [NDB](#) storage engine, transactions are supported. In MySQL 5.0, Cluster supports only the [READ COMMITTED](#) transaction isolation level.

28.10.16: What storage engines are supported by MySQL Cluster?

Clustering in MySQL is supported only by the [NDB](#) storage engine. That is, in order for a table to be shared between nodes in a cluster, it must be created using `ENGINE=NDB` (or `ENGINE=NDBCLUSTER`, which is equivalent).

It is possible to create tables using other storage engines (such as [MyISAM](#) or [InnoDB](#)) on a MySQL server being used for clustering, but these non-[NDB](#) tables will **not** participate in the cluster; they are local to the individual MySQL server instance on which they are created.

28.10.17: Which versions of the MySQL software support Cluster? Do I have to compile from source?

Cluster is supported in all server binaries in the 5.0 release series for operating systems on which MySQL Cluster is available. See [Section 5.2, “mysqld — The MySQL Server”](#). You can determine whether your server has NDB support using either the `SHOW VARIABLES LIKE 'have_%%'` or `SHOW ENGINES` statement.

Linux users, please note that **NDB** is *not* included in the standard MySQL server RPMs. Beginning with MySQL 5.0.4, there are separate RPM packages for the NDB storage engine and accompanying management and other tools; see the NDB RPM Downloads section of the MySQL 5.0 Downloads page for these. (Prior to 5.0.4, you had to use the `-max` binaries supplied as `.tar.gz` archives. This is still possible, but is not required, so you can use your Linux distribution's RPM manager if you prefer.)

You can also obtain NDB support by compiling MySQL from source, but it is not necessary to do so simply to use MySQL Cluster. To download the latest binary, RPM, or source distribution in the MySQL 5.0 series, visit <http://dev.mysql.com/downloads/mysql/5.0.html>.

28.10.18: In the event of a catastrophic failure — say, for instance, the whole city loses power and my UPS fails — would I lose all my data?

All committed transactions are logged. Therefore, although it is possible that some data could be lost in the event of a catastrophe, this should be quite limited. Data loss can be further reduced by minimizing the number of operations per transaction. (It is not a good idea to perform large numbers of operations per transaction in any case.)

28.10.19: Is it possible to use **FULLTEXT indexes with Cluster?**

FULLTEXT indexing is not supported by the **NDB** storage engine in MySQL 5.0, or by any storage engine other than **MyISAM**. We are working to add this capability in a future release.

28.10.20: Can I run multiple nodes on a single computer?

It is possible but not advisable. One of the chief reasons to run a cluster is to provide redundancy. To enjoy the full benefits of this redundancy, each node should reside on a separate machine. If you place multiple nodes on a single machine and that machine fails, you lose all of those nodes. Given that MySQL Cluster can be run on commodity hardware loaded with a low-cost (or even no-cost) operating system, the expense of an extra machine or two is well worth it to safeguard mission-critical data. It also worth noting that the requirements for a cluster host running a management node are minimal. This task can be accomplished with a 200 MHz Pentium CPU and sufficient RAM for the operating system plus a small amount of overhead for the `ndb_mgmd` and `ndb_mgm` processes.

It is acceptable to run multiple cluster data nodes on a single host for learning about MySQL Cluster, or for testing purposes; however, this is *not* supported for production use.

28.10.21: Can I add nodes to a cluster without restarting it?

Not at present. A simple restart is all that is required for adding new MGM or SQL nodes to a Cluster. When adding data nodes the process is more complex, and requires the following steps:

1. Make a complete backup of all Cluster data.
2. Completely shut down the cluster and all cluster node processes.
3. Restart the cluster, using the `--initial` startup option.

Warning

Never use the `--initial` when starting `ndbd` except when necessary to clear the data node filesystem. See [Section 16.5.5.2, “Command Options for `ndbd`”](#), for information about when this is required.

4. Restore all cluster data from the backup.

In a future MySQL Cluster release series, we hope to implement a “hot” reconfiguration capability for MySQL Cluster to minimize (if not eliminate) the requirement for restarting the cluster when adding new nodes. However, this is not planned for MySQL 5.0.

28.10.22: Are there any limitations that I should be aware of when using MySQL Cluster?

Limitations on **NDB** tables in MySQL 5.0 include:

- Temporary tables are not supported; a `CREATE TEMPORARY TABLE` statement using `ENGINE=NDB` or `ENGINE=NDBCLUSTER` fails with an error.
- **FULLTEXT** indexes and index prefixes are not supported. Only complete columns may be indexed.
- Spatial data types are not supported. See [Chapter 17, *Spatial Extensions*](#).
- Only complete rollbacks for transactions are supported. Partial rollbacks and rollbacks to save points are not supported.

- The maximum number of attributes allowed per table is 128, and attribute names cannot be any longer than 31 characters. For each table, the maximum combined length of the table and database names is 122 characters.
- The maximum size for a table row is 8 kilobytes, not counting `BLOB` values. There is no set limit for the number of rows per table. Table size limits depend on a number of factors, in particular on the amount of RAM available to each data node.
- The `NDB` engine does not support foreign key constraints. As with `MyISAM` tables, these are ignored.

For a complete listing of limitations in MySQL Cluster, see [Section 16.10, “Known Limitations of MySQL Cluster”](#).

28.10.23: How do I import an existing MySQL database into a cluster?

You can import databases into MySQL Cluster much as you would with any other version of MySQL. Other than the limitations mentioned elsewhere in this FAQ and in [Section 16.10, “Known Limitations of MySQL Cluster”](#), the only other special requirement is that any tables to be included in the cluster must use the `NDB` storage engine. This means that the tables must be created with `ENGINE=NDB` or `ENGINE=NDBCLUSTER`.

It is also possible to convert existing tables using other storage engines to `NDB Cluster` using one or more `ALTER TABLE` statement, but this requires an additional workaround. See [Section 16.10, “Known Limitations of MySQL Cluster”](#), for details.

28.10.24: How do cluster nodes communicate with one another?

Cluster nodes can communicate via any of three different protocols: TCP/IP, SHM (shared memory), and SCI (Scalable Coherent Interface). Where available, SHM is used by default between nodes residing on the same cluster host; however, this is considered experimental in MySQL 5.0. SCI is a high-speed (1 gigabit per second and higher), high-availability protocol used in building scalable multi-processor systems; it requires special hardware and drivers. See [Section 16.9, “Using High-Speed Interconnects with MySQL Cluster”](#), for more about using SCI as a transport mechanism in MySQL Cluster.

28.10.25: What is an arbitrator?

If one or more nodes in a cluster fail, it is possible that not all cluster nodes will be able to “see” one another. In fact, it is possible that two sets of nodes might become isolated from one another in a network partitioning, also known as a “split brain” scenario. This type of situation is undesirable because each set of nodes tries to behave as though it is the entire cluster.

When cluster nodes go down, there are two possibilities. If more than 50% of the remaining nodes can communicate with each other, we have what is sometimes called a “majority rules” situation, and this set of nodes is considered to be the cluster. The arbitrator comes into play when there is an even number of nodes: in such cases, the set of nodes to which the arbitrator belongs is considered to be the cluster, and nodes not belonging to this set are shut down.

The preceding information is somewhat simplified. A more complete explanation taking into account node groups follows:

When all nodes in at least one node group are alive, network partitioning is not an issue, because no one portion of the cluster can form a functional cluster. The real problem arises when no single node group has all its nodes alive, in which case network partitioning (the “split-brain” scenario) becomes possible. Then an arbitrator is required. All cluster nodes recognize the same node as the arbitrator, which is normally the management server; however, it is possible to configure any of the MySQL Servers in the cluster to act as the arbitrator instead. The arbitrator accepts the first set of cluster nodes to contact it, and tells the remaining set to shut down. Arbitrator selection is controlled by the `ArbitrationRank` configuration parameter for MySQL Server and management server nodes. (See [Section 16.3.4.4, “Defining the Management Server”](#), for details.) It should also be noted that the role of arbitrator does not in and of itself impose any heavy demands upon the host so designated, and thus the arbitrator host does not need to be particularly fast or to have extra memory especially for this purpose.

28.10.26: What data types are supported by MySQL Cluster?

MySQL Cluster supports all of the usual MySQL data types, with the exception of those associated with MySQL's spatial extensions. (See [Chapter 17, *Spatial Extensions*](#).) In addition, there are some differences with regard to indexes when used with `NDB` tables.

Note

MySQL Cluster tables (that is, tables created with `ENGINE=NDBCLUSTER`) have only fixed-width rows. This means that (for example) each record containing a `VARCHAR(255)` column will require space for 255 characters (as required for the character set and collation being used for the table), regardless of the actual number of characters stored therein. This issue is expected to be fixed in a future MySQL release series.

See [Section 16.10, “Known Limitations of MySQL Cluster”](#), for more information about these issues.

28.10.27: How do I start and stop MySQL Cluster?

It is necessary to start each node in the cluster separately, in the following order:

1. Start the management node with the `ndb_mgmd` command.
2. Start each data node with the `ndbd` command.
3. Start each MySQL server (SQL node) using `mysqld_safe --user=mysql &`.

Each of these commands must be run from a system shell on the machine housing the affected node. (You do not have to be physically present at the machine — a remote login shell can be used for this purpose.) You can verify that the cluster is running by starting the MGM management client `ndb_mgm` on the machine housing the MGM node and issuing the `SHOW` or `ALL STATUS` command.

To shut down a running cluster, issue the command `SHUTDOWN` in the MGM client. Alternatively, you may enter the following command in a system shell on the machine hosting the MGM node:

```
shell> ndb_mgm -e "SHUTDOWN"
```

(Note that the quotation marks are optional here; the `SHUTDOWN` command itself is not case-sensitive.)

Either of these commands causes the `ndb_mgm`, `ndb_mgm`, and any `ndbd` processes to terminate gracefully. MySQL servers running as Cluster SQL nodes can be stopped using `mysqladmin shutdown`.

For more information, see [Section 16.6.2, “Commands in the MySQL Cluster Management Client”](#), and [Section 16.2.6, “Safe Shutdown and Restart”](#).

28.10.28: What happens to cluster data when the cluster is shut down?

The data that was held in memory by the cluster's data nodes is written to disk, and is reloaded into memory the next time that the cluster is started.

28.10.29: Is it helpful to have more than one management node for a cluster?

It can be helpful as a fail-safe. Only one MGM node controls the cluster at any given time, but it is possible to configure one MGM as primary, and one or more additional management nodes to take over in the event that the primary MGM node fails.

See [Section 16.3.4, “Configuration File”](#), for information on how to configure MySQL Cluster management nodes.

28.10.30: Can I mix different kinds of hardware and operating systems in one MySQL Cluster?

Yes, so long as all machines and operating systems have the same “endianness” (all big-endian or all little-endian). It is also possible to use different MySQL Cluster releases on different nodes. However, we recommend this be done only as part of a rolling upgrade procedure (see [Section 16.4.1, “Performing a Rolling Restart of the Cluster”](#)).

28.10.31: Can I run two data nodes on a single host? Two SQL nodes?

Yes, it is possible to do this. In the case of multiple data nodes, it is advisable (but not required) for each node to use a different data directory. If you want to run multiple SQL nodes on one machine, each instance of `mysqld` must use a different TCP/IP port. However, *running more than one cluster node of a given type per machine is not supported for production use*.

28.10.32: Can I use hostnames with MySQL Cluster?

Yes, it is possible to use DNS and DHCP for cluster hosts. However, if your application requires “five nines” availability, we recommend using fixed IP addresses. Making communication between Cluster hosts dependent on services such as DNS and DHCP introduces additional points of failure, and the fewer of these, the better.

28.10.33: How do I handle MySQL users in a Cluster having multiple MySQL servers?

MySQL user accounts and privileges are not automatically propagated between different MySQL servers accessing the same MySQL Cluster. Therefore, you must make sure that these are copied between the SQL nodes yourself.

A.11. MySQL 5.0 FAQ — MySQL Chinese, Japanese, and Korean Character Sets

This set of Frequently Asked Questions derives from the experience of MySQL's Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

Questions

- [28.11.1](#): I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?

Questions and Answers

28.11.1: I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?

This problem is usually due to a setting in MySQL that doesn't match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:

- *Be certain of what MySQL version you are using.*

Use the statement `SELECT VERSION()` to determine this.

- *Make sure that the database is actually using the desired character set.*

People often think that the client character set is always the same as either the server character set or the character set used for display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or — better — yet by using this statement:

```
SELECT character_set_name, collation_name
FROM information_schema.columns
WHERE table_schema = your_database_name
AND table_name = your_table_name
AND column_name = your_column_name;
```

- *Determine the hexadecimal value of the character or characters that are not being displayed correctly.*

You can obtain this information for a column `column_name` in the table `table_name` using the following query:

```
SELECT HEX(column_name)
```

```
FROM table_name;
```

`3F` is the encoding for the `?` character; this means that `?` is the character actually stored in the column. This most often happens because of a problem converting a particular character from your client character set to the target character set.

- *Make sure that a round trip possible — that is, when you select `literal` (or `__introducer hexadecimal-value`), you obtain `literal` as a result.*

For example, the Japanese *Katakana* character *Pe* (`#`) exists in all CJK character sets, and has the code point value (hexadecimal coding) `0x30da`. To test a round trip for this character, use this query:

```
SELECT '#' AS `#`; /* or SELECT _ucs2 0x30da; */
```

If the result is not also `#`, then the round trip has failed.

For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX('#');`. Then we can determine whether the client encoding is correct.

- *Make sure that the problem is not with the browser or other application, rather than with MySQL.*

Use the `mysql` client program (on Windows: `mysql.exe`) to accomplish this task. If `mysql` displays correctly but your application doesn't, then your problem is probably due to system settings.

To find out what your settings are, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | utf8 |
| character_set_connection | utf8 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | utf8 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysql/charsets/ |
+-----+-----+
8 rows in set (0.03 sec)
```

These are typical character-set settings for an international-oriented client (notice the use of `utf8` Unicode) connected to a server in the West (`latin1` is a West Europe character set and a default for MySQL).

Although Unicode (usually the `utf8` variant on Unix, and the `ucs2` variant on Windows) is preferable to Latin, it's often not what your operating system utilities support best. Many Windows users find that a Microsoft character set, such as `cp932` for Japanese Windows, is what's suitable.

If you cannot control the server settings, and you have no idea what your underlying computer is, then try changing to a common character set for the country that you're in (`euckr` = Korea; `gb2312` or `gbk` = People's Republic of China; `big5` = Taiwan; `sjis`, `ujis`, `cp932`, or `eucjpms` = Japan; `ucs2` or `utf8` = anywhere). Usually it is necessary to change only the client and connection and results settings. There is a simple statement which changes all three at once: `SET NAMES`. For example:

```
SET NAMES 'big5';
```

Once the setting is correct, you can make it permanent by editing `my.cnf` or `my.ini`. For example you might add lines looking like these:

```
[mysqld]
character-set-server=big5
[client]
default-character-set=big5
```

It is also possible that there are issues with the API configuration setting being used in your application; see *Why does my GUI front end or browser not display CJK characters correctly...?* for more information.

28.11.2: What GB (Chinese) character sets does MySQL support?

MySQL supports the two common variants of the *GB* (*Guojia Biaozhun*, or *National Standard*) character sets which are official in the People's Republic of China: `gb2312` and `gbk`. Sometimes people try to insert `gbk` characters into `gb2312`, and it works most of the time because `gbk` is a superset of `gb2312` — but eventually they try to insert a rarer Chinese character and it doesn't work. (See [Bug#16072](#) for an example).

Here, we try to clarify exactly what characters are legitimate in `gb2312` or `gbk`, with reference to the official documents. Please

check these references before reporting [gb2312](#) or [gbk](#) bugs.

- For a complete listing of the [gb2312](#) characters, ordered according to the [gb2312_chinese_ci](#) collation: http://d.udm.net/bar/~bar/charts/gb2312_chinese_ci.html.
- MySQL's [gbk](#) is in reality “Microsoft code page 936”. This differs from the official [gbk](#) for characters [A1A4](#) (middle dot), [A1AA](#) (em dash), [A6E0–A6F5](#), and [A8BB–A8C0](#). For a listing of the differences, see <http://recode.progiciels-bpi.ca/showfile.html?name=dist/libiconv/gbk.h>.
- For a listing of [gbk](#)/Unicode mappings, see <http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT>.
- For MySQL's listing of [gbk](#) characters, see http://d.udm.net/bar/~bar/charts/gbk_chinese_ci.html.

28.11.3: What problems should I be aware of when working with the Big5 Chinese character set?

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). MySQL's [big5](#) is in reality Microsoft code page 950, which is very similar to the original [big5](#) character set. We changed to this character set starting with MySQL version 4.1.16 / 5.0.16 (as a result of [Bug#12476](#)). For example, the following statements work in current versions of MySQL, but not in old versions:

```
mysql> CREATE TABLE big5 (BIG5 CHAR(1) CHARACTER SET BIG5);
Query OK, 0 rows affected (0.13 sec)

mysql> INSERT INTO big5 VALUES (0xf9dc);
Query OK, 1 row affected (0.00 sec)

mysql> SELECT * FROM big5;
+-----+
| big5 |
+-----+
| #    |
+-----+
1 row in set (0.02 sec)
```

A feature request for adding [HKSCS](#) extensions has been filed. People who need this extension may find the suggested patch for [Bug#13577](#) to be of interest.

28.11.4: Why do Japanese character set conversions fail?

MySQL supports the [sjis](#), [ujis](#), [cp932](#), and [eucjpms](#) character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with [sjis](#) or [ujis](#)) and a Windows client (typically with [cp932](#)).

In the following conversion table, the [ucs2](#) column represents the source, and the [sjis](#), [cp932](#), [ujis](#), and [eucjpms](#) columns represent the destinations — that is, the last 4 columns provide the hexadecimal result when we use [CONVERT\(ucs2\)](#) or we assign a [ucs2](#) column containing the value to an [sjis](#), [cp932](#), [ujis](#), or [eucjpms](#) column.

Character Name	ucs2	sjis	cp932	ujis	eucjpms
BROKEN BAR	00A6	3F	3F	8FA2C3	3F
FULLWIDTH BROKEN BAR	FFE4	3F	FA55	3F	8FA2
YEN SIGN	00A5	3F	3F	20	3F
FULLWIDTH YEN SIGN	FFE5	818F	818F	A1EF	3F
TILDE	007E	7E	7E	7E	7E
OVERLINE	203E	3F	3F	20	3F
HORIZONTAL BAR	2015	815C	815C	A1BD	A1BD
EM DASH	2014	3F	3F	3F	3F
REVERSE SOLIDUS	005C	815F	5C	5C	5C
FULLWIDTH ""	FF3C	3F	815F	3F	A1C0
WAVE DASH	301C	8160	3F	A1C1	3F
FULLWIDTH TILDE	FF5E	3F	8160	3F	A1C1
DOUBLE VERTICAL LINE	2016	8161	3F	A1C2	3F
PARALLEL TO	2225	3F	8161	3F	A1C2
MINUS SIGN	2212	817C	3F	A1DD	3F
FULLWIDTH HYPHEN-MINUS	FF0D	3F	817C	3F	A1DD
CENT SIGN	00A2	8191	3F	A1F1	3F

Character Name	ucs2	sjis	cp932	ujis	eucjms
FULLWIDTH CENT SIGN	FFE0	3F	8191	3F	A1F1
POUND SIGN	00A3	8192	3F	A1F2	3F
FULLWIDTH POUND SIGN	FFE1	3F	8192	3F	A1F2
NOT SIGN	00AC	81CA	3F	A2CC	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA	3F	A2CC

Now consider this portion of the table:

	ucs2	sjis	cp932
NOT SIGN	00AC	81CA	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA

This means that MySQL converts the `NOT SIGN` (Unicode `U+00AC`) to `sjis` code point `0x81CA` and to `cp932` code point `3F`. (`3F` is the question mark (“?”) — this is what is always used when the conversion cannot be performed.

28.11.5: What should I do if I want to convert SJIS 81CA to cp932?

Our answer is: “?”. There are serious complaints about this: many people would prefer a “loose” conversion, so that `81CA` (`NOT SIGN`) in `sjis` becomes `81CA` (`FULLWIDTH NOT SIGN`) in `cp932`. We are considering a change to this behavior.

28.11.6: How does MySQL represent the Yen (¥) sign?

A problem arises because some versions of Japanese character sets (both `sjis` and `euc`) treat `5C` as a *reverse solidus* (`\` — also known as a backslash), and others treat it as a yen sign (¥).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, `5C` is always the *reverse solidus* (`\`).

28.11.7: Do MySQL plan to make a separate character set where 5C is the Yen sign, as at least one other major DBMS does?

This is one possible solution to the Yen sign issue; however, this will not happen in MySQL 5.1 or 5.2.

28.11.8: Of what issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the `euckr` (*Extended Unix Code Korea*) character set, only one problem has been noted.

We use the “ASCII” variant of EUC-KR, in which the code point `0x5c` is REVERSE SOLIDUS, that is `\`, instead of the “KS-Roman” variant of EUC-KR, in which the code point `0x5c` is `WON SIGN(#)`. This means that you cannot convert Unicode `U+20A9` to `euckr`:

```
mysql> SELECT
->   CONVERT('#' USING euckr) AS euckr,
->   HEX(CONVERT('#' USING euckr)) AS hexeuckr;
+-----+-----+
| euckr | hexeuckr |
+-----+-----+
| ?    | 3F      |
+-----+-----+
1 row in set (0.00 sec)
```

MySQL's graphic Korean chart is here: http://d.udm.net/bar/~bar/charts/euckr_korean_ci.html.

28.11.9: Why do I get DATA TRUNCATED error messages?

For illustration, we'll create a table with one Unicode (`ucs2`) column and one Chinese (`gb2312`) column.

```
mysql> CREATE TABLE ch
->   (ucs2 CHAR(3) CHARACTER SET ucs2,
->   gb2312 CHAR(3) CHARACTER SET gb2312);
Query OK, 0 rows affected (0.05 sec)
```

We'll try to place the rare character `#` in both columns.

```
mysql> INSERT INTO ch VALUES ('A#B','A#B');
Query OK, 1 row affected, 1 warning (0.00 sec)
```

Ah, there's a warning. Let's see what it is.

```
mysql> SHOW WARNINGS;
```

```

+-----+-----+-----+
| Level | Code | Message |
+-----+-----+-----+
| Warning | 1265 | Data truncated for column 'gb2312' at row 1 |
+-----+-----+-----+
1 row in set (0.00 sec)

```

So it's a warning about the `gb2312` column only.

```

mysql> SELECT ucs2,HEX(ucs2),gb2312,HEX(gb2312) FROM ch;
+-----+-----+-----+-----+
| ucs2 | HEX(ucs2) | gb2312 | HEX(gb2312) |
+-----+-----+-----+-----+
| A#B | 00416C4C0042 | A?B | 413F42 |
+-----+-----+-----+-----+
1 row in set (0.00 sec)

```

There are several things that need explanation here.

1. The fact that it's a “warning” rather than an “error” is characteristic of MySQL. We like to try to do what we can, to get the best fit, rather than give up.
2. The `#` character isn't in the `gb2312` character set. We described that problem earlier.
3. Admittedly the message is misleading. We didn't “truncate” in this case, we replaced with a question mark. We've had a complaint about this message (See [Bug#9337](#)). But until we come up with something better, just accept that error/warning code 2165 can mean a variety of things.
4. With `SQL_MODE=TRADITIONAL`, there would be an error message, but instead of error 2165 you would see: `ERROR 1406 (22001): Data too long for column 'gb2312' at row 1.`

28.11.10: Why does my GUI front end or browser not display CJK characters correctly in my application using Access, PHP, or another API?

Obtain a direct connection to the server using the `mysql` client (Windows: `mysql.exe`), and try the same query there. If `mysql` responds correctly, then the trouble may be that your application interface requires initialization. Use `mysql` to tell you what character set or sets it uses with the statement `SHOW VARIABLES LIKE 'char%'`; . If you are using Access, then you are most likely connecting with MyODBC. In this case, you should check [Section 24.1.3, “Connector/ODBC Configuration”](#). If, for instance, you use `big5`, you would enter `SET NAMES 'big5'`. (Note that no `;` is required in this case). If you are using ASP, you might need to add `SET NAMES` in the code. Here is an example that has worked in the past:

```

<%
Session.CodePage=0
Dim strConnection
Dim Conn
strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username; " \
& "pwd=password;database=database;stmt=SET NAMES 'big5';"
Set Conn = Server.CreateObject("ADODB.Connection")
Conn.Open strConnection
%>

```

In much the same way, if you are using any character set other than `latin1` with Connector/NET, then you must specify the character set in the connection string. See [Section 24.2.5.1, “Connecting to MySQL Using Connector/NET”](#), for more information.

If you are using PHP, try this:

```

<?php
$link = mysql_connect($host, $usr, $pwd);

mysql_select_db($db);

if( mysql_error() ) { print "Database ERROR: " . mysql_error(); }
mysql_query("SET NAMES 'utf8'", $link);
?>

```

In this case, we used `SET NAMES` to change `character_set_client` and `character_set_connection` and `character_set_results`.

We encourage the use of the newer `mysqli` extension, rather than `mysql`. Using `mysqli`, the previous example could be rewritten as shown here:

```

<?php
$link = new mysqli($host, $usr, $pwd, $db);

if( mysqli_connect_errno() )
{
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$link->query("SET NAMES 'utf8'");

```

```
?>
```

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a `<meta>` tag suffices to correct the problem: for example, to insure that the user agent interprets page content as UTF-8, you should include `<meta http-equiv="Content-Type" content="text/html; charset=utf-8">` in the `<head>` of the HTML page.

If you are using Connector/J, see [Section 24.4.4.4, “Using Character Sets and Unicode”](#).

28.11.11: I've upgraded to MySQL 5.0. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single “global” character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a “handshake”, as described in [Section 9.4, “Connection Character Sets and Collations”](#):

When a client connects, it sends to the server the name of the character set that it wants to use. The server uses the name to set the `character_set_client`, `character_set_results`, and `character_set_connection` system variables. In effect, the server performs a `SET NAMES` operation using the character set name.

The effect of this is that you cannot control the client character set by starting `mysqld` with `--character-set-server=utf8`. However, some of our Asian customers have said that prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a `mysqld` switch, `--character-set-client-handshake`, which can be turned off with `--skip-character-set-client-handshake`. If you start `mysqld` with `--skip-character-set-client-handshake`, then, when a client connects, it sends to the server the name of the character set that it wants to use — however, *the server ignores this request from the client*.

By way of example, suppose that your favorite server character set is `latin1` (unlikely in a CJK area, but this is the default value). Suppose further that the client uses `utf8` because this is what the client's operating system supports. Now, start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The current settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | utf8 |
| character_set_connection | utf8 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | utf8 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysql/charsets/ |
+-----+-----+
8 rows in set (0.01 sec)
```

Now stop the client, and then stop the server using `mysqladmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```

Start the client with `utf8` once again as the default character set, then display the current settings:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | latin1 |
| character_set_connection | latin1 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | latin1 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysql/charsets/ |
+-----+-----+
8 rows in set (0.01 sec)
```

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client's initial settings if the `--skip-character-set-client-handshake` is used.

28.11.12: Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?

There is a very simple problem with `LIKE` searches on `BINARY` and `BLOB` columns: we need to know the end of a character. With multi-byte character sets, different characters might have different octet lengths. For example, in `utf8`, `A` requires one byte but `#` requires three bytes, as shown here:

```
+-----+-----+
| OCTET_LENGTH(_utf8 'A') | OCTET_LENGTH(_utf8 '#') |
+-----+-----+
| 1 | 3 |
+-----+-----+
1 row in set (0.00 sec)
```

If we don't know where the first character ends, then we don't know where the second character begins, in which case even very simple searches such as `LIKE '_A%'` fail. The solution is to use a regular CJK character set in the first place, or to convert to a CJK character set before comparing.

This is one reason why MySQL cannot allow encodings of nonexistent characters. If it is not strict about rejecting bad input, then it has no way of knowing where characters end.

For `FULLTEXT` searches, we need to know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary — the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a comprehensive word list, which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

28.11.13: What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the `ucjps` character set was not supported prior to MySQL 5.0.3 (see [Section E.1.27, “Changes in MySQL 5.0.3 \(23 March 2005: Beta\)”](#)). However, since the name of the applicable language appears in the `DESCRIPTION` column for every entry in the `INFORMATION_SCHEMA.CHARACTER_SETS` table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
-> FROM INFORMATION_SCHEMA.CHARACTER_SETS
-> WHERE DESCRIPTION LIKE '%Chinese%'
-> OR DESCRIPTION LIKE '%Japanese%'
-> OR DESCRIPTION LIKE '%Korean%'
-> ORDER BY CHARACTER_SET_NAME;
```

CHARACTER_SET_NAME	DESCRIPTION
big5	Big5 Traditional Chinese
cp932	SJIS for Windows Japanese
ucjps	UJIS for Windows Japanese
euckr	EUC-KR Korean
gb2312	GB2312 Simplified Chinese
gbk	GBK Simplified Chinese
sjis	Shift-JIS Japanese
ujis	EUC-JP Japanese

```
8 rows in set (0.01 sec)
```

(See [Section 21.9, “The INFORMATION_SCHEMA.CHARACTER_SETS Table”](#), for more information.)

28.11.14: How do I know whether character *x* is available in all character sets?

The majority of simplified Chinese and basic non-halfwidth Japanese *Kana* characters appear in all CJK character sets. This stored procedure accepts a `UCS-2` Unicode character, converts it to all other character sets, and displays the results in hexadecimal.

```
DELIMITER //

CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN

CREATE TABLE tj
(ucs2 CHAR(1) character set ucs2,
utf8 CHAR(1) character set utf8,
big5 CHAR(1) character set big5,
cp932 CHAR(1) character set cp932,
ucjps CHAR(1) character set ucjps,
euckr CHAR(1) character set euckr,
gb2312 CHAR(1) character set gb2312,
gbk CHAR(1) character set gbk,
sjis CHAR(1) character set sjis,
ujis CHAR(1) character set ujis);

INSERT INTO tj (ucs2) VALUES (ucs2_char);

UPDATE tj SET utf8=ucs2,
big5=ucs2,
cp932=ucs2,
ucjps=ucs2,
euckr=ucs2,
gb2312=ucs2,
```

```

        gbk=ucs2,
        sjis=ucs2,
        ujis=ucs2;

/* If there's a conversion problem, UPDATE will produce a warning. */

SELECT hex(ucs2) AS ucs2,
       hex(utf8) AS utf8,
       hex(big5) AS big5,
       hex(cp932) AS cp932,
       hex(eucjpms) AS eucjpms,
       hex(euckr) AS euckr,
       hex(gb2312) AS gb2312,
       hex(gbk) AS gbk,
       hex(sjis) AS sjis,
       hex(ujis) AS ujis
FROM tj;

DROP TABLE tj;

END//

```

The input can be any single `ucs2` character, or it can be the code point value (hexadecimal representation) of that character. For example, from Unicode's list of `ucs2` encodings and names (<http://www.unicode.org/Public/UNIDATA/UnicodeData.txt>), we know that the *Katakana* character *Pe* appears in all CJK character sets, and that its code point value is `0x30da`. If we use this value as the argument to `p_convert()`, the result is as shown here:

```

mysql> CALL p_convert(0x30da)//
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| ucs2 | utf8 | big5 | cp932 | eucjpms | euckr | gb2312 | gbk | sjis | ujis |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 30DA | E3839A | C772 | 8379 | A5DA | ABDA | A5DA | A5DA | 8379 | A5DA |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
1 row in set (0.04 sec)

```

Since none of the column values is `3F` — that is, the question mark character (?) — we know that every conversion worked.

28.11.15: Why don't CJK strings sort correctly in Unicode? (I)

Sometimes people observe that the result of a `utf8_unicode_ci` or `ucs2_unicode_ci` search, or of an `ORDER BY` sort is not what they think a native would expect. Although we never rule out the possibility that there is a bug, we have found in the past that many people do not read correctly the standard table of weights for the Unicode Collation Algorithm. MySQL uses the table found at <http://www.unicode.org/Public/UCA/4.0.0/allkeys-4.0.0.txt>. This is not the first table you will find by navigating from the [unicode.org](http://www.unicode.org) home page, because MySQL uses the older 4.0.0 “allkeys” table, rather than the more recent 4.1.0 table. This is because we are very wary about changing ordering which affects indexes, lest we bring about situations such as that reported in [Bug#16526](#), illustrated as follows:

```

mysql< CREATE TABLE tj (s1 CHAR(1) CHARACTER SET utf8 COLLATE utf8_unicode_ci);
Query OK, 0 rows affected (0.05 sec)

mysql> INSERT INTO tj VALUES ('#'),('#');
Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM tj WHERE s1 = '#';
+-----+
| s1 |
+-----+
| # |
| # |
+-----+
2 rows in set (0.00 sec)

```

The character in the first result row is not the one that we searched for. Why did MySQL retrieve it? First we look for the Unicode code point value, which is possible by reading the hexadecimal number for the `ucs2` version of the characters:

```

mysql> SELECT s1, HEX(CONVERT(s1 USING ucs2)) FROM tj;
+-----+-----+
| s1 | HEX(CONVERT(s1 USING ucs2)) |
+-----+-----+
| # | 304C |
| # | 304B |
+-----+-----+
2 rows in set (0.03 sec)

```

Now we search for `304B` and `304C` in the 4.0.0 `allkeys` table, and find these lines:

```

304B ; [.1E57.0020.000E.304B] # HIRAGANA LETTER KA
304C ; [.1E57.0020.000E.304B][.0000.0140.0002.3099] # HIRAGANA LETTER GA; QOCM

```

The official Unicode names (following the “#” mark) tell us the Japanese syllabary (Hiragana), the informal classification (letter, digit, or punctuation mark), and the Western identifier (`KA` or `GA`, which happen to be voiced and unvoiced components of the same letter pair). More importantly, the *primary weight* (the first hexadecimal number inside the square brackets) is `1E57` on both lines. For comparisons in both searching and sorting, MySQL pays attention to the primary weight only, ignoring all the other numbers. This means that we are sorting `#` and `#` correctly according to the Unicode specification. If we wanted to distinguish them, we'd have to use a non-UCA (Unicode Collation Algorithm) collation (`utf8_unicode_bin` or `utf8_general_ci`), or to compare

the `HEX()` values, or use `ORDER BY CONVERT(s1 USING sjis)`. Being correct “according to Unicode” isn't enough, of course: the person who submitted the bug was equally correct. We plan to add another collation for Japanese according to the JIS X 4061 standard, in which voiced/unvoiced letter pairs like *KA/GA* are distinguishable for ordering purposes.

28.11.16: Why don't CJK strings sort correctly in Unicode? (II)

If you are using Unicode (`ucs2` or `utf8`), and you know what the Unicode sort order is (see [Section A.11, “MySQL 5.0 FAQ — MySQL Chinese, Japanese, and Korean Character Sets”](#)), but MySQL still seems to sort your table incorrectly, then you should first verify the table character set:

```
mysql> SHOW CREATE TABLE t\G
***** 1. row *****
Table: t
Create Table: CREATE TABLE `t` (
  `s1` char(1) CHARACTER SET ucs2 DEFAULT NULL
) ENGINE=MyISAM DEFAULT CHARSET=latin1
1 row in set (0.00 sec)
```

Since the character set appears to be correct, let's see what information the `INFORMATION_SCHEMA.COLUMNS` table can provide about this column:

```
mysql> SELECT COLUMN_NAME, CHARACTER_SET_NAME, COLLATION_NAME
-> FROM INFORMATION_SCHEMA.COLUMNS
-> WHERE COLUMN_NAME = 's1'
-> AND TABLE_NAME = 't';
+-----+-----+-----+
| COLUMN_NAME | CHARACTER_SET_NAME | COLLATION_NAME |
+-----+-----+-----+
| s1          | ucs2               | ucs2_general_ci |
+-----+-----+-----+
1 row in set (0.01 sec)
```

(See [Section 21.3, “The INFORMATION_SCHEMA COLUMNS Table”](#), for more information.)

You can see that the collation is `ucs2_general_ci` instead of `ucs2_unicode_ci`. The reason why this is so can be found using `SHOW CHARSET`, as shown here:

```
mysql> SHOW CHARSET LIKE 'ucs2%';
+-----+-----+-----+-----+
| Charset | Description | Default collation | Maxlen |
+-----+-----+-----+-----+
| ucs2    | UCS-2 Unicode | ucs2_general_ci   | 2      |
+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

For `ucs2` and `utf8`, the default collation is “general”. To specify a Unicode collation, use `COLLATE ucs2_unicode_ci`.

28.11.17: Why are my supplementary characters rejected by MySQL?

MySQL does not support supplementary characters — that is, characters which need more than 3 bytes — for `UTF-8`. We support only what Unicode calls the *Basic Multilingual Plane / Plane 0*. Only a few very rare Han characters are supplementary; support for them is uncommon. This has led to reports such as that found in [Bug#12600](#), which we rejected as “not a bug”. With `utf8`, we must truncate an input string when we encounter bytes that we don't understand. Otherwise, we wouldn't know how long the bad multi-byte character is.

One possible workaround is to use `ucs2` instead of `utf8`, in which case the “bad” characters are changed to question marks; however, no truncation takes place. You can also change the data type to `BLOB` or `BINARY`, which perform no validity checking.

We intend at some point in the future to add support for `UTF-16`, which would solve such issues by allowing 4-byte characters. However, we have as yet set no definite timetable for doing so.

28.11.18: Shouldn't it be “CJKV”?

No. The term “CJKV” (*Chinese Japanese Korean Vietnamese*) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL has no plan to support the old Vietnamese script using Han characters. MySQL does of course support the modern Vietnamese script with Western characters.

[Bug#4745](#) is a request for a specialized Vietnamese collation, which we might add in the future if there is sufficient demand for it.

28.11.19: Does MySQL allow CJK characters to be used in database and table names?

This issue is fixed in MySQL 5.1, by automatically rewriting the names of the corresponding directories and files.

For example, if you create a database named `#` on a server whose operating system does not support CJK in directory names, MySQL creates a directory named `@0w@00a5@00ae`. which is just a fancy way of encoding `E6A5AE` — that is, the Unicode hexadecimal representation for the `#` character. However, if you run a `SHOW DATABASES` statement, you can see that the database is listed as `#`.

28.11.20: Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?

A Simplified Chinese version of the Manual, current for MySQL 5.1.12, can be found at <http://dev.mysql.com/doc/#chinese-5.1>. The Japanese translation of the MySQL 4.1 manual can be downloaded from <http://dev.mysql.com/doc/#japanese-4.1>.

28.11.21: Where can I get help with CJK and related issues in MySQL?

The following resources are available:

- A listing of MySQL user groups can be found at <http://dev.mysql.com/user-groups/>.
- You can contact a sales engineer at the MySQL KK Japan office using any of the following:

```
Tel: +81(0)3-5326-3133
Fax: +81(0)3-5326-3001
Email: dsaito@mysql.com
```

- View feature requests relating to character set issues at <http://tinyurl.com/y6xcuf>.
- Visit the MySQL [Character Sets, Collation, Unicode Forum](http://forums.mysql.com/). We are also in the process of adding foreign-language forums at <http://forums.mysql.com/>.

A.12. MySQL 5.0 FAQ — Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- [Section 23.2.14, “Common Questions and Problems When Using the C API”](#)
- [Section 23.3.1, “Common Problems with MySQL and PHP”](#)
- [Section 24.1.6, “Connector/ODBC Notes and Tips”](#)
- [Section 24.2.5, “Connector/NET Notes and Tips”](#)
- [Section 24.4.5, “Connector/J Notes and Tips”](#)
- [Section 24.5.5, “Connector/MXJ Notes and Tips”](#)

A.13. MySQL 5.0 FAQ — Replication

For answers to common queries and question regarding Replication within MySQL, see [Section 15.3.4, “Replication FAQ”](#).

A.14. MySQL 5.0 FAQ — MySQL, DRBD, and Heartbeat

A.14.1. Distributed Replicated Block Device

In the following section, we provide answers to questions that are most frequently asked about Distributed Replicated Block Device (DRBD).

Questions

- [28.14.1.1: What is DRBD?](#)
- [28.14.1.2: What are “Block Devices”?](#)
- [28.14.1.3: How is DRBD licensed?](#)
- [28.14.1.4: Where can I download DRBD?](#)
- [28.14.1.5: If I find a bug in DRBD, to whom do I submit the issue?](#)
- [28.14.1.6: Where can I get more technical and business information concerning MySQL and DRBD?](#)

Questions and Answers

28.14.1.1: What is DRBD?

DRBD is an acronym for Distributed Replicated Block Device. DRBD is an open source Linux kernel block device which leverages synchronous replication to achieve a consistent view of data between two systems, typically an Active and Passive system. DRBD currently supports all the major flavors of Linux and comes bundled in several major Linux distributions. The DRBD project is maintained by [LINBIT](#).

28.14.1.2: What are “Block Devices”?

Block devices are the type of device used to represent storage in the Linux Kernel. All physical disk devices present a “block device” interface. Additionally, virtual disk systems like LVM or DRBD present a “block device” interface. In this way, the file system or other software that might want to access a disk device can be used with any number of real or virtual devices without having to know anything about their underlying implementation details.

28.14.1.3: How is DRBD licensed?

DRBD is licensed under the GPL.

28.14.1.4: Where can I download DRBD?

Please see <http://www.drbd.org/download.html>

28.14.1.5: If I find a bug in DRBD, to whom do I submit the issue?

Bug reports should be submitted to the DRBD mailing list. Please see: <http://lists.linbit.com/>.

28.14.1.6: Where can I get more technical and business information concerning MySQL and DRBD?

Please visit: <http://mysql.com/drbd/>

A.14.2. Linux Heartbeat

In the following section, we provide answers to questions that are most frequently asked about Linux Heartbeat.

Questions

- [28.14.2.1](#): What is Linux Heartbeat?
- [28.14.2.2](#): How is Linux Heartbeat licensed?
- [28.14.2.3](#): Where can I download Linux Heartbeat?
- [28.14.2.4](#): If I find a bug with Linux Heartbeat, to whom do I submit the issue?

Questions and Answers

28.14.2.1: What is Linux Heartbeat?

The Linux-HA project (<http://www.linux-ha.org/>) offers a high availability solution commonly referred to as Linux Heartbeat. Linux Heartbeat ships as part of several Linux distributions, as well as within several embedded high availability systems. This solution can also be used for other applications besides databases servers, such as mail servers, web servers, file servers, and DNS servers.

Linux Heartbeat implements a heartbeat-protocol. A heartbeat-protocol means that messages are sent at regular intervals between two or more nodes. If a message is not received from a node within a given interval, then it is assumed the node has failed and some type of failover or recovery action is required. Linux Heartbeat is typically configured to send these heartbeat messages over standard Ethernet interfaces, but it does also support other methods, such as serial-line links.

28.14.2.2: How is Linux Heartbeat licensed?

Linux Heartbeat is licensed under the GPL.

28.14.2.3: Where can I download Linux Heartbeat?

Please see <http://linux-ha.org/download/index.html>.

28.14.2.4: If I find a bug with Linux Heartbeat, to whom do I submit the issue?

Bug reports should be submitted to <http://www.linux-ha.org/ClusterResourceManager/BugReports>.

A.14.3. DRBD Architecture

In the following section, we provide answers to questions that are most frequently asked about DRBD Architecture.

Questions

- [28.14.3.1](#): Is an Active/Active option available for MySQL with DRBD?
- [28.14.3.2](#): What MySQL storage engines are supported with DRBD?
- [28.14.3.3](#): How long does a failover take?
- [28.14.3.4](#): How long does it take to resynchronize data after a failure?

Questions and Answers

28.14.3.1: Is an Active/Active option available for MySQL with DRBD?

Currently, MySQL does not support Active/Active configurations using DRBD “out of the box”.

28.14.3.2: What MySQL storage engines are supported with DRBD?

All of the MySQL transactional storage engines are supported by DRBD, including InnoDB and Falcon. For archived or read-only data, MyISAM or Archive can also be used.

28.14.3.3: How long does a failover take?

Failover time is dependent on many things, some of which are configurable. After activating the passive host, MySQL will have to start and run a normal recovery process. If the InnoDB log files have been configured to a large size and there was heavy write traffic, this may take a reasonably long period of time. However, under normal circumstances, failover tends to take less than a minute.

28.14.3.4: How long does it take to resynchronize data after a failure?

Resynchronization time depends on how long the two machines are out of communication and how much data was written during that period of time. Resynchronization time is a function of data to be synced, network speed and disk speed. DRBD maintains a bitmap of changed blocks on the primary machine, so only those blocks that have changed will need to be transferred.

A.14.4. DRBD and MySQL Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication Scale-out.

Questions

- [28.14.4.1](#): What is the difference between MySQL Cluster and DRBD?
- [28.14.4.2](#): What is the difference between MySQL Replication and DRBD?
- [28.14.4.3](#): How can I combine MySQL Replication scale-out with DRBD?

Questions and Answers

28.14.4.1: What is the difference between MySQL Cluster and DRBD?

Both MySQL Cluster and DRBD replicate data synchronously. MySQL Cluster leverages a shared-nothing storage architecture in which the cluster can be architected beyond an Active/Passive configuration. DRBD operates at a much lower level within the “stack”, at the disk I/O level. For a comparison of various high availability features between these two options, please refer to [Chapter 14, High Availability, Scalability, and DRBD](#).

28.14.4.2: What is the difference between MySQL Replication and DRBD?

MySQL Replication replicates data asynchronously while DRBD replicates data synchronously. For a comparison of various high availability features between these two options, please refer to the high availability comparison grid, [Chapter 14, High Availability, Scalability, and DRBD](#).

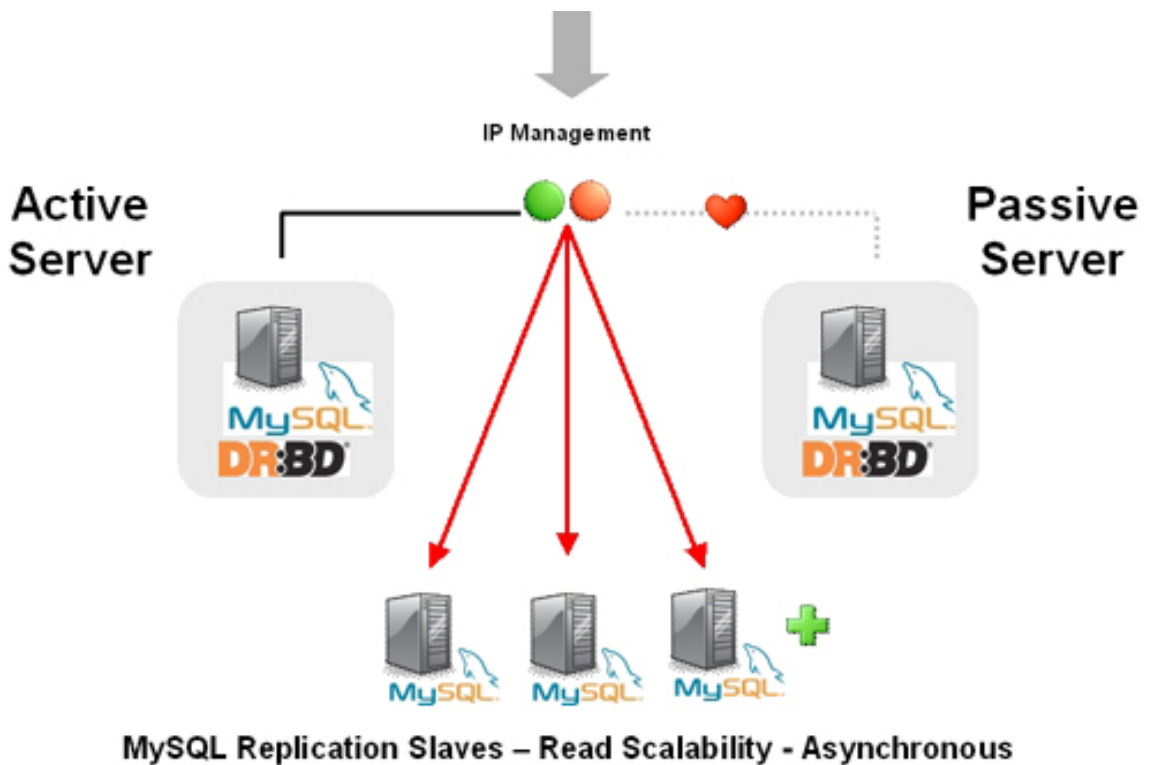

28.14.4.3: How can I combine MySQL Replication scale-out with DRBD?

MySQL Replication is typically deployed in a Master to many Slaves configuration. In this configuration, having many Slaves

provides read scalability. DRBD is used to provide high-availability for the Master MySQL Server in an Active/Passive configuration. This provides for automatic failover, safeguards against data loss, and automatically synchronizes the failed MySQL Master after a failover.

The most likely scenario in which MySQL Replication scale-out can be leveraged with DRBD is in the form of attaching replicated MySQL “read-slaves” off of the Active-Master MySQL Server, shown in [Figure A.1, “Active-Master MySQL server”](#). Since DRBD replicates an entire block device, master information such as the binary logs are also replicated. In this way, all of the slaves can attach to the Virtual IP Address managed by Linux Heartbeat. In the event of a failure, the asynchronous nature of MySQL Replication allows the slaves to continue with the new Active machine as their master with no intervention needed.

Figure A.1. Active-Master MySQL server

A.14.5. DRBD and File Systems

In the following section, we provide answers to questions that are most frequently asked about DRBD and file systems.

Questions

- [28.14.5.1: Can XFS be used with DRBD?](#)

Questions and Answers

28.14.5.1: Can XFS be used with DRBD?

Yes. XFS uses dynamic block size, thus DRBD 0.7 or later is needed.

A.14.6. DRBD and LVM

In the following section, we provide answers to questions that are most frequently asked about DRBD and LVM.

Questions

- [28.14.6.1: Can I use DRBD on top of LVM?](#)
- [28.14.6.2: Can I use LVM on top of DRBD?](#)

- [28.14.6.3](#): Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?

Questions and Answers

28.14.6.1: Can I use DRBD on top of LVM?

Yes, DRBD supports on-line resizing. If you enlarge your logical volume that acts as a backing device for DRBD, you can enlarge DRBD itself too, and of course your file system if it supports resizing.

28.14.6.2: Can I use LVM on top of DRBD?

Yes, you can use DRBD as a Physical Volume (PV) for LVM. Depending on the default LVM configuration shipped with your distribution, you may need to add the `/dev/drbd*` device files to the `filter` option in your `lvm.conf` so LVM scans your DRBDs for PV signatures.

28.14.6.3: Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?

This requires careful tuning of your LVM configuration to avoid duplicate PV scans, but yes, it is possible.

A.14.7. DRBD and Virtualization

In the following section, we provide answers to questions that are most frequently asked about DRBD and virtualization.

Questions

- [28.14.7.1](#): Can I use DRBD with OpenVZ?
- [28.14.7.2](#): Can I use DRBD with Xen and/or KVM?

Questions and Answers

28.14.7.1: Can I use DRBD with OpenVZ?

See http://wiki.openvz.org/HA_cluster_with_DRBD_and_Heartbeat.

28.14.7.2: Can I use DRBD with Xen and/or KVM?

Yes. If you are looking for professional consultancy or expert commercial support for Xen- or KVM-based virtualization clusters with DRBD, contact LINBIT (<http://www.linbit.com>).

A.14.8. DRBD and Security

In the following section, we provide answers to questions that are most frequently asked about DRBD and security.

Questions

- [28.14.8.1](#): Can I encrypt/compress the exchanged data?
- [28.14.8.2](#): Does DRBD do mutual node authentication?

Questions and Answers

28.14.8.1: Can I encrypt/compress the exchanged data?

Yes. But there is no option within DRBD to allow for this. You'll need to leverage a VPN and the network layer should do the rest.

28.14.8.2: Does DRBD do mutual node authentication?

Yes, starting with DRBD 8 shared-secret mutual node authentication is supported.

A.14.9. DRBD and System Requirements

In the following section, we provide answers to questions that are most frequently asked about DRBD and System Requirements.

Questions

- [28.14.9.1](#): What other packages besides DRBD are required?
- [28.14.9.2](#): How many machines are required to set up DRBD?
- [28.14.9.3](#): Does DRBD only run on Linux?

Questions and Answers

28.14.9.1: What other packages besides DRBD are required?

When using pre-built binary packages, none except a matching kernel, plus packages for [glibc](#) and your favorite shell. When compiling DRBD from source additional prerequisite packages may be required. They include but are not limited to:

- glib-devel
- openssl
- devel
- libgcrypt-devel
- glib2-devel
- pkgconfig
- ncurses-devel
- rpm-build
- rpm-devel
- redhat-rpm-config
- gcc
- gcc-c++
- bison
- flex
- gnutls-devel
- lm_sensors-devel
- net-snmp-devel
- python-devel
- bzip2-devel
- libselinux-devel
- perl-DBI
- libnet

Pre-built x86 and x86_64 packages for specific kernel versions are available with a support subscription from LINBIT. Please note that if the kernel is upgraded, DRBD must be as well.

28.14.9.2: How many machines are required to set up DRBD?

Two machines are required to achieve the minimum degree of high availability. Although at any one given point in time one will be primary and one will be secondary, it is better to consider the machines as part of a mirrored pair without a “natural” primary machine.

28.14.9.3: Does DRBD only run on Linux?

DRBD is a Linux Kernel Module, and can work with many popular Linux distributions. DRBD is currently not available for non-Linux operating systems.

A.14.10. DRBD and Support and Consulting

In the following section, we provide answers to questions that are most frequently asked about DRBD and resources.

Questions

- [28.14.10.1](#): Does MySQL offer professional consulting to help with designing a DRBD system?
- [28.14.10.2](#): Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?
- [28.14.10.3](#): Are pre-built binaries or RPMs available?
- [28.14.10.4](#): Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?
- [28.14.10.5](#): Is there a dedicated discussion forum for MySQL High-Availability?
- [28.14.10.6](#): Where can I get more information about MySQL for DRBD?

Questions and Answers

28.14.10.1: Does MySQL offer professional consulting to help with designing a DRBD system?

Yes. MySQL offers consulting for the design, installation, configuration, and monitoring of high availability DRBD. For more information concerning a High Availability Jumpstart, please see: <http://www.mysql.com/consulting/packaged/scaleout.html>.

28.14.10.2: Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?

Yes. Support for DRBD is available with an add-on subscription to MySQL Enterprise called “DRBD for MySQL”. For more information about support options for DRBD see: <http://mysql.com/products/enterprise/features.html>.

For the list of supported Linux distributions, please see: <http://www.mysql.com/support/supportedplatforms/enterprise.html>.

Note

DRBD is only available on Linux. DRBD is not available on Windows, MacOS, Solaris, HP-UX, AIX, FreeBSD, or other non-Linux platforms.

28.14.10.3: Are pre-built binaries or RPMs available?

Yes. “DRBD for MySQL” is an add-on subscription to MySQL Enterprise, which provides pre-built binaries for DRBD. For more information see: <http://mysql.com/products/enterprise/features.html>.

28.14.10.4: Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?

Coming soon.

28.14.10.5: Is there a dedicated discussion forum for MySQL High-Availability?

Yes, <http://forums.mysql.com/list.php?144>.

28.14.10.6: Where can I get more information about MySQL for DRBD?

For more information about MySQL for DRBD, including a technical white paper please see: [DRBD for MySQL High Availability](#).

Appendix B. Errors, Error Codes, and Common Problems

This appendix lists common problems and errors that may occur and potential resolutions, in addition to listing the errors that may appear when you call MySQL from any host language. The first section covers problems and resolutions. Detailed information on errors is provided; The first list displays server error messages. The second list displays client program messages.

MySQL Enterprise

The MySQL Enterprise Monitor provides a “Virtual DBA” to assist with problem solving. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

B.1. Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

B.1.1. How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:
 - The keyboard doesn't work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light doesn't change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
 - The mouse pointer doesn't move.
 - The machine doesn't answer to a remote machine's pings.
 - Other programs that are not related to MySQL don't behave correctly.
 - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as `glibc`) are up to date.

It's always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See [Section 5.11, “MySQL Server Logs”](#).
- If you don't think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it doesn't want to die, there is probably a bug in the operating system.

If after you have examined all other possibilities and you have concluded that the MySQL server or a MySQL client is causing the problem, it's time to create a bug report for our mailing list or our support team. In the bug report, try to give a very detailed description of how the system is behaving and what you think is happening. You should also state why you think that MySQL is causing the problem. Take into consideration all the situations in this chapter. State any problems exactly how they appear when you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system doesn't work.” This doesn't provide us with any information about what could be the problem.

If a program fails, it's always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in [Section 1.8, “How to Report Bugs or Problems”](#).

B.1.2. Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

B.1.2.1. Access denied

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server allows client programs to use when connecting. See [Section 5.7.8, “Causes of Access denied Errors”](#), and [Section 5.7.2, “How the Privilege System Works”](#).

B.1.2.2. Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the filesystem (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you don't specify a hostname or if you specify the special hostname `localhost`.

If the MySQL server is running on Windows, you can connect via TCP/IP. If the server is started with the `-enable-named-pipe` option, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you don't give a hostname when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that doesn't work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the hostname.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket filename or TCP/IP port number when trying to connect to the server.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, the network port you specified is the one configured on the server, and that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See [Section 2.4.16.2.3, “Starting and Troubleshooting the MySQL Server”](#).

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket filename might be different in your setup. `host_ip` represents the IP number of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=socket --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotes with the `hostname` command; these cause the output of `hostname` (that is, the current hostname) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the hostname of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running. Check your operating system's process list to ensure the `mysqld` process is present.

- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: [Section B.1.2.2.1, "Connection to MySQL Server Failing on Windows"](#).
- You are running on a system that uses MIT-pthreads. If you are running on a system that doesn't have native threads, `mysqld` uses the MIT-pthreads package. See [Section 2.4.2, "Operating Systems Supported by MySQL Community Server"](#). However, not all MIT-pthreads versions support Unix socket files. On a system without socket file support, you must always specify the hostname explicitly when connecting to the server. Try using this command to check the connection to the server:

```
shell> mysqladmin -h `hostname` version
```

- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See [Section B.1.4.5, "How to Protect or Change the MySQL Unix Socket File"](#).
- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket pathname for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

```
shell> netstat -ln | grep mysql
```

See [Section B.1.4.5, "How to Protect or Change the MySQL Unix Socket File"](#).

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill` or with the `mysql_zap` script) before you can restart the MySQL server. See [Section B.1.4.2, "What to Do If MySQL Keeps Crashing"](#).
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket filename in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.
- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)
- Make sure that your `mysqld` server was not started with the `--skip-networking` option. If it was, you cannot connect to it using TCP/IP.
- Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default).

Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked.

Under Windows, applications such as ZoneAlarm and the Windows XP personal firewall may need to be configured to allow external access to a MySQL server.

- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, make sure you have disabled SELinux protection for the `mysqld` process.

B.1.2.2.1. Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows doesn't allow for enough ephemeral (short-lived) ports to serve those connections.

By default, Windows allows 5000 ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a `TIME_WAIT` status for 120 seconds. This status allows the connection to be reused at a much lower cost than reinitializing a brand new connection. However, the port will not be available again until this time expires.

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

IMPORTANT: The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore the registry if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: <http://support.microsoft.com/kb/256986/EN-US/>.

1. Start Registry Editor (`Regedt32.exe`).
2. Locate the following key in the registry:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
```

3. On the `Edit` menu, click `Add Value`, and then add the following registry value:

```
Value Name: MaxUserPort
Data Type: REG_DWORD
Value: 65534
```

This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the `Edit` menu, click `Add Value`, and then add the following registry value:

```
Value Name: TcpTimedWaitDelay
Data Type: REG_DWORD
Value: 30
```

This sets the number of seconds to hold a TCP port connection in `TIME_WAIT` state before closing. The valid range is between 0 (zero) and 300 (decimal). The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

B.1.2.3. Lost connection to MySQL server

An error of the form `Lost connection to MySQL server at 'XXX', system error: errno` can indicate that the server's `connect_timeout` value is set too low.

B.1.2.4. Client does not support authentication protocol

MySQL 5.0 uses an authentication protocol based on a password hashing algorithm that is incompatible with that used by older (pre-4.1) clients. If you upgrade the server from 4.0, attempts to connect to it with an older client may fail with the following message:

```
shell> mysql
Client does not support authentication protocol requested
by server; consider upgrading MySQL client
```

To solve this problem, you should use one of the following approaches:

- Upgrade all client programs to use a 4.1.1 or newer client library.

- When connecting to the server with a pre-4.1 client program, use an account that still has a pre-4.1-style password.
- Reset the password to pre-4.1 style for each user that needs to use a pre-4.1 client program. This can be done using the `SET PASSWORD` statement and the `OLD_PASSWORD()` function:

```
mysql> SET PASSWORD FOR
-> 'some_user'@'some_host' = OLD_PASSWORD('newpwd');
```

Alternatively, use `UPDATE` and `FLUSH PRIVILEGES`:

```
mysql> UPDATE mysql.user SET Password = OLD_PASSWORD('newpwd')
-> WHERE Host = 'some_host' AND User = 'some_user';
mysql> FLUSH PRIVILEGES;
```

Substitute the password you want to use for “`newpwd`” in the preceding examples. MySQL cannot tell you what the original password was, so you’ll need to pick a new one.

- Tell the server to use the older password hashing algorithm:
 1. Start `mysqld` with the `--old-passwords` option.
 2. Assign an old-format password to each account that has had its password updated to the longer 4.1 format. You can identify these accounts with the following query:

```
mysql> SELECT Host, User, Password FROM mysql.user
-> WHERE LENGTH>Password) > 16;
```

For each account record displayed by the query, use the `Host` and `User` values and assign a password using the `OLD_PASSWORD()` function and either `SET PASSWORD` or `UPDATE`, as described earlier.

Note

In older versions of PHP, the `mysql` extension does not support the authentication protocol in MySQL 4.1.1 and higher. This is true regardless of the PHP version being used. If you wish to use the `mysql` extension with MySQL 4.1 or newer, you may need to follow one of the options discussed above for configuring MySQL to work with old clients. The `mysqli` extension (stands for “MySQL, Improved”; added in PHP 5) is compatible with the improved password hashing employed in MySQL 4.1 and higher, and no special configuration of MySQL need be done to use this MySQL client library. For more information about the `mysqli` extension, see <http://php.net/mysqli>.

It may also be possible to compile the older `mysql` extension against the new MySQL client library. This is beyond the scope of this Manual; consult the PHP documentation for more information. You also be able to obtain assistance with these issues in our [MySQL with PHP forum](#).

For additional background on password hashing and authentication, see [Section 5.7.9, “Password Hashing as of MySQL 4.1”](#).

B.1.2.5. Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

B.1.2.6. Host '`host_name`' is blocked

If you get the following error, it means that `mysqld` has received many connect requests from the host '`host_name`' that have been interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqladmin flush-hosts'
```

The number of interrupted connect requests allowed is determined by the value of the `max_connect_errors` system variable. After `max_connect_errors` failed requests, `mysqld` assumes that something is wrong (for example, that someone is trying to

break in), and blocks the host from further connections until you execute a `mysqladmin flush-hosts` command or issue a `FLUSH HOSTS` statement. See [Section 5.2.3, “System Variables”](#).

By default, `mysqld` blocks a host after 10 connection errors. You can adjust the value by starting the server like this:

```
shell> mysqld_safe --max_connect_errors=10000 &
```

If you get this error message for a given host, you should first verify that there isn't anything wrong with TCP/IP connections from that host. If you are having network problems, it does you no good to increase the value of the `max_connect_errors` variable.

B.1.2.7. Too many connections

If you get a `Too many connections` error when you try to connect to the `mysqld` server, this means that all available connections are in use by other clients.

The number of connections allowed is controlled by the `max_connections` system variable. Its default value is 100. If you need to support more connections, you should restart `mysqld` with a larger value for this variable.

MySQL Enterprise

Subscribers to the MySQL Enterprise Monitor receive advice on dynamically configuring the `max_connections` variable — avoiding failed connection attempts. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

`mysqld` actually allows `max_connections+1` clients to connect. The extra connection is reserved for use by accounts that have the `SUPER` privilege. By granting the `SUPER` privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See [Section 12.5.4.21, “SHOW PROCESSLIST Syntax”](#).

The maximum number of connections MySQL can support depends on the quality of the thread library on a given platform. Linux or Solaris should be able to support 500-1000 simultaneous connections, depending on how much RAM you have and what your clients are doing. Static Linux binaries provided by MySQL AB can support up to 4000 connections.

B.1.2.8. Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

B.1.2.9. MySQL server has gone away

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent):

Error Code	Description
<code>CR_SERVER_GONE_ERROR</code>	The client couldn't send a question to the server.
<code>CR_SERVER_LOST</code>	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See [Section 5.2.3, “System Variables”](#).

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.

- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

The problem on Windows is that in some cases MySQL doesn't get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

Prior to MySQL 5.0.19, even if the `reconnect` flag in the `MYSQL` structure is equal to 1, MySQL does not automatically reconnect and re-issue the query as it doesn't know if the server did get the original query or not.

The solution to this is to either do a `mysql_ping` on the connection if there has been a long time since the last query (this is what `MyODBC` does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 1MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in [Section B.1.2.10, "Packet too large"](#).

An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.

- You also get a lost connection if you are sending a packet 16MB or larger if your client is older than 4.0.8 and your server is 4.0.8 and above, or the other way around.
- It is also possible to see this error if hostname lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working — from MySQL's point of view the problem is indistinguishable from any other network timeout.

You may also see the `MySQL server has gone away` error if MySQL is started with the `--skip-networking` option.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See [Section B.1.4.2, "What to Do If MySQL Keeps Crashing"](#).

You can get more information about the lost connections by starting `mysqld` with the `--log-warnings=2` option. This logs some of the disconnected errors in the `hostname.err` file. See [Section 5.11.1, "The Error Log"](#).

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See [Section B.1.4.2, "What to Do If MySQL Keeps Crashing"](#).
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See [MySQL Internals: Porting](#).

- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the `--log` option to determine whether the problem query appears in the log?

See also [Section B.1.2.11, “Communication Errors and Aborted Connections”](#), and [Section 1.8, “How to Report Bugs or Problems”](#).

B.1.2.10. Packet too large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

The largest possible packet that can be transmitted to or from a MySQL 5.0 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues a `Packet too large` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 1MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 16MB, start the server like this:

```
shell> mysqld --max_allowed_packet=16M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 16MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=16M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

B.1.2.11. Communication Errors and Aborted Connections

The server error log can be a useful source of information about connection problems. See [Section 5.11.1, “The Error Log”](#). If you start the server with the `--log-warnings` option, you might find messages like this in your error log:

```
010301 14:38:23 Aborted connection 854 to db: 'users' user: 'josh'
```

If `Aborted connections` messages appear in the error log, the cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See [Section 5.2.3, “System Variables”](#).
- The client program ended abruptly in the middle of a data transfer.

When any of these things happen, the server increments the `Aborted_clients` status variable.

The server increments the `Aborted_connects` status variable when the following things happen:

- A client doesn't have privileges to connect to a database.
- A client uses an incorrect password.
- A connection packet doesn't contain the right information.
- It takes more than `connect_timeout` seconds to get a connect packet. See [Section 5.2.3, “System Variables”](#).

If these kinds of things happen, it might indicate that someone is trying to break into your server!

MySQL Enterprise

For reasons of security and performance the advisors provided by the MySQL Enterprise Monitor pay special attention to the `Aborted_connections` status variable. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

Other reasons for problems with aborted clients or aborted connections:

- Use of Ethernet protocol with Linux, both half and full duplex. Many Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file via FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. The only solution is switching the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and testing the results to determine the best setting.
- Some problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.
- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See [Section B.1.2.10, “Packet too large”](#).

See also [Section B.1.2.9, “MySQL server has gone away”](#).

B.1.2.12. The table is full

The maximum effective table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. The following table lists some examples of operating system file-size limits. This is only a rough guide and is not intended to be definitive. For the most up-to-date information, be sure to check the documentation specific to your operating system.

Operating System	File-size Limit
Win32 w/ FAT/FAT32	2GB/4GB
Win32 w/ NTFS	2TB (possibly larger)
Linux 2.2-Intel 32-bit	2GB (LFS: 4GB)
Linux 2.4+	(using ext3 filesystem) 4TB
Solaris 9/10	16TB
MacOS X w/ HFS+	2TB
NetWare w/NSS filesystem	8TB

Windows users, please note that FAT and VFAT (FAT32) are *not* considered suitable for production use with MySQL. Use NTFS instead.

On Linux 2.2, you can get [MyISAM](#) tables larger than 2GB in size by using the Large File Support (LFS) patch for the ext2 filesystem. Most current Linux distributions are based on kernel 2.4 or higher and include all the required LFS patches. On Linux 2.4, patches also exist for ReiserFS to get support for big files (up to 2TB). With JFS and XFS, petabyte and larger files are possible on Linux.

For a detailed overview about LFS in Linux, have a look at Andreas Jaeger's *Large File Support in Linux* page at http://www.suse.de/~aj/linux_lfs.html.

If you do encounter a full-table error, there are several reasons why it might have occurred:

- The **InnoDB** storage engine maintains **InnoDB** tables within a tablespace that can be created from several files. This allows a table to exceed the maximum individual file size. The tablespace can include raw disk partitions, which allows extremely large tables. The maximum tablespace size is 64TB.

If you are using **InnoDB** tables and run out of room in the **InnoDB** tablespace. In this case, the solution is to extend the **InnoDB** tablespace. See [Section 13.2.7, “Adding and Removing InnoDB Data and Log Files”](#).

- You are using **MyISAM** tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.
- You are using a **MyISAM** table and the space required for the table exceeds what is allowed by the internal pointer size. **MyISAM** creates tables to allow up to 4GB by default (256TB as of MySQL 5.0.6), but this limit can be changed up to the maximum allowable size of 65,536TB ($256^7 - 1$ bytes).

If you need a **MyISAM** table that is larger than the default limit and your operating system supports large files, the **CREATE TABLE** statement supports **AVG_ROW_LENGTH** and **MAX_ROWS** options. See [Section 12.1.5, “CREATE TABLE Syntax”](#). The server uses these options to determine how large a table to allow.

If the pointer size is too small for an existing table, you can change the options with **ALTER TABLE** to increase a table's maximum allowable size. See [Section 12.1.2, “ALTER TABLE Syntax”](#).

```
ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
```

You have to specify **AVG_ROW_LENGTH** only for tables with **BLOB** or **TEXT** columns; in this case, MySQL can't optimize the space required based only on the number of rows.

To change the default size limit for **MyISAM** tables, set the **myisam_data_pointer_size**, which sets the number of bytes used for internal row pointers. The value is used to set the pointer size for new tables if you do not specify the **MAX_ROWS** option. The value of **myisam_data_pointer_size** can be from 2 to 7. A value of 4 allows tables up to 4GB; a value of 6 allows tables up to 256TB.

You can check the maximum data and index sizes by using this statement:

```
SHOW TABLE STATUS FROM db_name LIKE 'tbl_name';
```

You also can use **myisamchk -dv /path/to/table-index-file**. See [Section 12.5.4, “SHOW Syntax”](#), or [Section 7.5, “myisamchk — MyISAM Table-Maintenance Utility”](#).

Other ways to work around file-size limits for **MyISAM** tables are as follows:

- If your large table is read-only, you can use **myisampack** to compress it. **myisampack** usually compresses a table by at least 50%, so you can have, in effect, much bigger tables. **myisampack** also can merge multiple tables into a single table. See [Section 7.7, “myisampack — Generate Compressed, Read-Only MyISAM Tables”](#).
- MySQL includes a **MERGE** library that allows you to handle a collection of **MyISAM** tables that have identical structure as a single **MERGE** table. See [Section 13.3, “The MERGE Storage Engine”](#).
- You are using the **NDB** storage engine, in which case you need to increase the values for the **DataMemory** and **IndexMemory** configuration parameters in your **config.ini** file. See [Section 16.3.5.1, “Data Node Configuration Parameters”](#).
- You are using the **MEMORY (HEAP)** storage engine; in this case you need to increase the value of the **max_heap_table_size** system variable. See [Section 5.2.3, “System Variables”](#).

B.1.2.13. Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '\\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start **mysqld** with the **--tmpdir** option or to add the option to the **[mysqld]** section of your option file. For example, to specify a directory of **C:\temp**, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See [Section 4.3.2, “Using Option Files”](#).

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `pererror`. One reason the server cannot write to a table is that the filesystem is full:

```
shell> pererror 28
OS error code 28: No space left on device
```

If you get an error of the following type during startup, it indicates that the filesystem and/or directory used for storing data files is write protected. Providing the write error is to a test file, This error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

B.1.2.14. Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

B.1.2.15. Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system.

The following list indicates possible causes of and fixes for this problem:

- You may be running a new version of `mysqld` with an old `user` table. You can check this by executing `mysqlshow mysql user` to see whether the `Password` column is shorter than 16 characters. If so, you can correct this condition by running the `scripts/add_long_password` script.
- The account has an old password (eight characters long) and you didn't start `mysqld` with the `--old-protocol` option. Update the account in the `user` table to have a new password or restart `mysqld` with the `--old-protocol` option.
- You have specified a password in the `user` table without using the `PASSWORD()` function. Use `mysql` to update the account in the `user` table with a new password, making sure to use the `PASSWORD()` function:

```
mysql> UPDATE user SET Password=PASSWORD('newpwd')
-> WHERE User='some_user' AND Host='some_host';
```

B.1.2.16. Table '`tbl_name`' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a filesystem that has case-sensitive filenames.
- Even for filesystems that are not case sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See [Section 12.5.4, “SHOW Syntax”](#).

B.1.2.17. Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multi-byte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `configure` with the `--with-charset=charset_name` or `--with-extra-charsets=charset_name` option. See [Section 2.4.15.2, “Typical configure Options”](#).

All standard MySQL binaries are compiled with `--with-extra-character-sets=complex`, which enables support for all multi-byte character sets. See [Section 5.10.1, “The Character Set Used for Data and Sorting”](#).

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

- Recompile the client with support for the character set. See [Section 2.4.15.2, “Typical configure Options”](#).
- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
- Copy the character definition files to the path where the client expects them to be.

B.1.2.18. 'FILE' NOT FOUND and Similar Errors

If you get `ERROR '...' not found (errno: 23), Can't open file: ... (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you haven't allocated enough file descriptors for the MySQL server. You can use the `pererror` utility to get a description of what the error number means:

```
shell> pererror 23
OS error code 23: File table overflow
shell> pererror 24
OS error code 24: Too many open files
shell> pererror 11
OS error code 11: Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_cache` system variable (the default value is 64). Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or (as of MySQL 3.23.30) set the `open_files_limit` system variable. See [Section 5.2.3, “System Variables”](#). The easiest way to set these values is to add an option to your option file. See [Section 4.3.2, “Using Option Files”](#). If you have an old version of `mysqld` that doesn't support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the “#” character to uncomment this line, and change the number 256 to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

Note

If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

B.1.3. Installation-Related Issues

B.1.3.1. Problems Linking to the MySQL Client Library

When you are linking an application program to use the MySQL client library, you might get undefined reference errors for symbols that start with `mysql_`, such as those shown here:

```
/tmp/ccFKsdPa.o: In function `main':
/tmp/ccFKsdPa.o(.text+0xb): undefined reference to `mysql_init'
/tmp/ccFKsdPa.o(.text+0x31): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x57): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x69): undefined reference to `mysql_error'
/tmp/ccFKsdPa.o(.text+0x9a): undefined reference to `mysql_close'
```

You should be able to solve this problem by adding `-Ldir_path -lmysqlclient` at the end of your link command, where `dir_path` represents the pathname of the directory where the client library is located. To determine the correct directory, try this command:

```
shell> mysql_config --libs
```

The output from `mysql_config` might indicate other libraries that should be specified on the link command as well.

If you get `undefined reference` errors for the `uncompress` or `compress` function, add `-lz` to the end of your link command and try again.

If you get `undefined reference` errors for a function that should exist on your system, such as `connect`, check the manual page for the function in question to determine which libraries you should add to the link command.

You might get `undefined reference` errors such as the following for functions that don't exist on your system:

```
mf_format.o(.text+0x201): undefined reference to `__lxstat'
```

This usually means that your MySQL client library was compiled on a system that is not 100% compatible with yours. In this case, you should download the latest MySQL source distribution and compile MySQL yourself. See [Section 2.4.15, "MySQL Installation Using a Source Distribution"](#).

You might get undefined reference errors at runtime when you try to execute a MySQL program. If these errors specify symbols that start with `mysql_` or indicate that the `mysqlclient` library can't be found, it means that your system can't find the shared `libmysqlclient.so` library. The fix for this is to tell your system to search for shared libraries where the library is located. Use whichever of the following methods is appropriate for your system:

- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY_PATH` environment variable.
- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY` environment variable.
- Copy `libmysqlclient.so` to some directory that is searched by your system, such as `/lib`, and update the shared library information by executing `ldconfig`.

Another way to solve this problem is by linking your program statically with the `-static` option, or by removing the dynamic MySQL libraries before linking your code. Before trying the second method, you should be sure that no other programs are using the dynamic libraries.

B.1.3.2. Problems with File Permissions

If you have problems with file permissions, the `UMASK` environment variable might be set incorrectly when `mysqld` starts. For example, MySQL might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/filename.frm' (Errcode: 13)
```

The default `UMASK` value is `0660`. You can change this behavior by starting `mysqld_safe` as follows:

```
shell> UMASK=384 # = 600 in octal
shell> export UMASK
shell> mysqld_safe &
```

By default, MySQL creates database and `RAID` directories with an access permission value of `0700`. You can modify this behavior by setting the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, if you want to give group access to all new directories, you can do this:

```
shell> UMASK_DIR=504 # = 770 in octal
shell> export UMASK_DIR
```

```
shell> mysqld_safe &
```

In MySQL 3.23.25 and above, MySQL assumes that the value for `UMASK` and `UMASK_DIR` is in octal if it starts with a zero.

See [Section 2.4.20, “Environment Variables”](#).

B.1.4. Administration-Related Issues

B.1.4.1. How to Reset the Root Password

If you have never set a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, it is recommended to set a password for each account. See [Section 5.6.1, “General Security Guidelines”](#).

If you set a `root` password previously, but have forgotten what it was, you can set a new password. The following procedure is for Windows systems. The procedure for Unix systems is given later in this section.

The procedure under Windows:

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager:

```
Start Menu -> Control Panel -> Administrative Tools -> Services
```

Then find the MySQL service in the list, and stop it.

If your server is not running as a service, you may need to use the Task Manager to force it to stop.

3. Create a text file and place the following command within it on a single line:

```
SET PASSWORD FOR 'root'@'localhost' = PASSWORD('MyNewPassword');
```

Save the file with any name. For this example the file will be `C:\mysql-init.txt`.

4. Open a console window to get to the DOS command prompt:

```
Start Menu -> Run -> cmd
```

5. We are assuming that you installed MySQL to `C:\mysql`. If you installed MySQL to another location, adjust the following commands accordingly.

At the DOS command prompt, execute this command:

```
C:\> C:\mysql\bin\mysqld-nt --init-file=C:\mysql-init.txt
```

The contents of the file named by the `--init-file` option are executed at server startup, changing the `root` password. After the server has started successfully, you should delete `C:\mysql-init.txt`.

If you install MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.0\bin\mysqld-nt.exe"
--defaults-file="C:\Program Files\MySQL\MySQL Server 5.0\my.ini"
--init-file=C:\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager:

```
Start Menu -> Control Panel -> Administrative Tools -> Services
```

Find the MySQL service in the list, right-click on it, and choose the `Properties` option. The `Path to executable` field contains the `--defaults-file` setting.

6. Stop the MySQL server, then restart it in normal mode again. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.
7. You should be able to connect using the new password.

In a Unix environment, the procedure for resetting the `root` password is as follows:

MySQL Enterprise

For expert advice on security-related issues, subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

1. Log on to your system as either the Unix `root` user or as the same user that the `mysqld` server runs as.
2. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, hostname, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the filename has the extension of `.pid` and begins with either `mysqld` or your system's hostname.

You can stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process, using the pathname of the `.pid` file in the following command:

```
shell> kill `cat /mysql-data-directory/host_name.pid`
```

Note the use of backticks rather than forward quotes with the `cat` command; these cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file and place the following command within it on a single line:

```
SET PASSWORD FOR 'root'@'localhost' = PASSWORD('MyNewPassword');
```

Save the file with any name. For this example the file will be `~/mysql-init`.

4. Restart the MySQL server with the special `--init-file=~/mysql-init` option:

```
shell> mysqld_safe --init-file=~/mysql-init &
```

The contents of the init-file are executed at server startup, changing the root password. After the server has started successfully you should delete `~/mysql-init`.

5. You should be able to connect using the new password.

Alternatively, on any platform, you can set the new password using the `mysql` client (but this approach is less secure):

1. Stop `mysqld` and restart it with the `--skip-grant-tables --user=root` options (Windows users omit the `--user=root` portion).
2. Connect to the `mysqld` server with this command:

```
shell> mysql -u root
```

3. Issue the following statements in the `mysql` client:

```
mysql> UPDATE mysql.user SET Password=PASSWORD('newpwd')
-> WHERE User='root';
mysql> FLUSH PRIVILEGES;
```

Replace `"newpwd"` with the actual `root` password that you want to use.

4. You should be able to connect using the new password.

B.1.4.2. What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This doesn't mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See [Section 5.11.1, "The Error Log"](#).

On some systems, you can find in the error log a stack trace of where `mysqld` died that you can resolve with the `resolve_stack_dump` program. See [MySQL Internals: Porting](#). Note that the variable values written in the error log may not al-

ways be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with `-delay-key-write`, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that doesn't support good filesystem locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it's at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Please try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all MyISAM tables, and restart `mysqld`. This ensures that you are running from a clean state. See [Chapter 5, Database Administration](#).
- Start `mysqld` with the `--log` option and try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See [Section 5.11.2, "The General Query Log"](#). If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have been able to locate the bug and should submit a bug report for it. See [Section 1.8, "How to Report Bugs or Problems"](#).
- Try to make a test case that we can use to repeat the problem. See [MySQL Internals: Porting](#).
- Try running the tests in the `mysql-test` directory and the MySQL benchmarks. See [Section 26.1.2, "MySQL Test Suite"](#). They should test MySQL rather well. You can also add code to the benchmarks that simulates your application. The benchmarks can be found in the `sql-bench` directory in a source distribution or, for a binary distribution, in the `sql-bench` directory under your MySQL installation directory.
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- If you configure MySQL for debugging, it is much easier to gather information about possible errors if something goes wrong. Configuring MySQL for debugging causes a safe memory allocator to be included that can find some errors. It also provides a lot of output about what is happening. Reconfigure MySQL with the `--with-debug` or `--with-debug=full` option to [configure](#) and then recompile. See [MySQL Internals: Porting](#).
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- Have you tried `mysqladmin -u root processlist` when `mysqld` appears to be running but not responding? Sometimes `mysqld` is not comatose even though you might think so. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while you run your other queries.
- Try the following:
 1. Start `mysqld` from `gdb` (or another debugger). See [MySQL Internals: Porting](#).

2. Run your test scripts.
3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

```
backtrace
info local
up
info local
up
info local
```

With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where `N` is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to crash or misbehave.
- Send a normal bug report. See [Section 1.8, “How to Report Bugs or Problems”](#). Be even more detailed than usual. Because MySQL works for many people, it may be that the crash results from something that exists only on your computer (for example, an error that is related to your particular system libraries).
- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

The current dynamic row code has been in use at MySQL AB for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Do not rule out your server hardware when diagnosing problems. Defective hardware can be the cause of data corruption. Particular attention should be paid to both RAMS and hard-drives when troubleshooting hardware.

B.1.4.3. How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, you can take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- To abort the thread, you must use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition allows the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA INFILE` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

MySQL Enterprise

For early notification of possible problems with your MySQL configuration subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

B.1.4.4. Where MySQL Stores Temporary Files

MySQL uses the value of the `TMPDIR` environment variable as the pathname of the directory in which to store temporary files. If you don't have `TMPDIR` set, MySQL uses the system default, which is normally `/tmp`, `/var/tmp`, or `/usr/tmp`. If the filesystem containing your temporary file directory is too small, you can use the `--tmpdir` option to `mysqld` to specify a directory in a filesystem where you have enough space.

In MySQL 5.0, the `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (":") on Unix and semicolon characters (";") on Windows, NetWare, and OS/2.

Note

To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you should not set `--tmpdir` to point to a directory on a memory-based filesystem or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or `LOAD DATA INFILE` operations. If files in the temporary file directory are lost when the server restarts, replication fails.

MySQL creates all temporary files as hidden files. This ensures that the temporary files are removed if `mysqld` is terminated. The disadvantage of using hidden files is that you do not see a big temporary file that fills up the filesystem in which the temporary file directory is located.

MySQL Enterprise

Advisors provided by the MySQL Enterprise Monitor automatically detect excessive temporary table storage to disk. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some `SELECT` queries, MySQL also creates temporary SQL tables. These are not hidden and have names of the form `SQL_*`.

`ALTER TABLE` creates a temporary table in the same directory as the original table.

B.1.4.5. How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

```
[mysqld]
socket=/path/to/socket

[client]
socket=/path/to/socket
```

See [Section 4.3.2, "Using Option Files"](#).

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.
- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.

- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `--with-unix-socket-path` option when you run `configure`. See [Section 2.4.15.2](#), “Typical configure Options”.

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

B.1.4.6. Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs; for example, in `mysqld_safe` or `mysql.server`. See [Section 2.4.20](#), “Environment Variables”.

You can set the time zone for the server with the `--timezone=timezone_name` option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The allowable values for `--timezone` or `TZ` are system-dependent. Consult your operating system documentation to see what values are acceptable.

B.1.5. Query-Related Issues

B.1.5.1. Case Sensitivity in Searches

By default, MySQL searches are not case sensitive. This means that if you search with `col_name LIKE 'a%'`, you get all column values that start with `A` or `a`. If you want to make this search case sensitive, make sure that one of the operands has a case sensitive or binary collation. For example, if you are comparing a column and a string that both have the `latin1` character set, you can use the `COLLATE` operator to cause either operand to have the `latin1_general_cs` or `latin1_bin` collation. For example:

```
col_name COLLATE latin1_general_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_general_cs
col_name COLLATE latin1_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case sensitive or binary collation. See [Section 12.1.5](#), “CREATE TABLE Syntax”.

Simple comparison operations (`>=`, `>`, `=`, `<`, `<=`, sorting, and grouping) are based on each character's “sort value.” Characters with the same sort value (such as “`E`”, “`e`”, and “`é`”) are treated as the same character.

B.1.5.2. Problems Using DATE Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is allowed. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
mysql> SELECT * FROM tbl_name WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context (and vice versa). It is also smart enough to allow a “relaxed” string form when updating and in a `WHERE` clause that compares a date to a `TIMESTAMP`, `DATE`, or `DATETIME` column. (“Relaxed form” means that any punctuation character may be used as the separator between parts. For example, `'2004-08-15'` and `'2004#08#15'` are equivalent.) MySQL can also convert a string containing no separators (such as `'20040815'`), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any other comparison method than those just listed, such as `IN` or `STRCMP()`.

For these exceptional cases, the comparison is done by converting the objects to strings and performing a string comparison.

To keep things safe, assume that strings are compared as strings and use the appropriate string functions if you want to compare a

temporal value to a string.

The special date '0000-00-00' can be stored and retrieved as '0000-00-00'. When using a '0000-00-00' date through MyODBC, it is automatically converted to `NULL` in MyODBC 2.50.12 and above, because ODBC can't handle this kind of date.

Because MySQL performs the conversions described above, the following statements work:

```
mysql> INSERT INTO tbl_name (idate) VALUES (19970505);
mysql> INSERT INTO tbl_name (idate) VALUES ('19970505');
mysql> INSERT INTO tbl_name (idate) VALUES ('97-05-05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997.05.05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997 05 05');
mysql> INSERT INTO tbl_name (idate) VALUES ('0000-00-00');

mysql> SELECT idate FROM tbl_name WHERE idate >= '1997-05-05';
mysql> SELECT idate FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT MOD(idate,100) FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT idate FROM tbl_name WHERE idate >= '19970505';
```

However, the following does not work:

```
mysql> SELECT idate FROM tbl_name WHERE STRCMP(idate,'20030505')=0;
```

`STRCMP()` is a string function, so it converts `idate` to a string in 'YYYY-MM-DD' format and performs a string comparison. It does not convert '20030505' to the date '2003-05-05' and perform a date comparison.

If you are using the `ALLOW_INVALID_DATES` SQL mode, MySQL allows you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12.

This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

If you are not using the `NO_ZERO_IN_DATE` SQL mode, the day or month part can be zero. This is convenient if you want to store a birthdate in a `DATE` column and you know only part of the date.

If you are not using the `NO_ZERO_DATE` SQL mode, MySQL also allows you to store '0000-00-00' as a “dummy date.” This is in some cases more convenient than using `NULL` values.

If the date cannot be converted to any reasonable value, a 0 is stored in the `DATE` column, which is retrieved as '0000-00-00'. This is both a speed and a convenience issue. We believe that the database server's responsibility is to retrieve the same date you stored (even if the data was not logically correct in all cases). We think it is up to the application and not the server to check the dates.

If you want MySQL to check all dates and accept only legal dates (unless overridden by `IGNORE`), you should set `sql_mode` to "NO_ZERO_IN_DATE,NO_ZERO_DATE".

Date handling in MySQL 5.0.1 and earlier works like MySQL 5.0.2 with the `ALLOW_INVALID_DATES` SQL mode enabled.

B.1.5.3. Problems with `NULL` Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string ''. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with `NULL` handling, you can use the `IS NULL` and `IS NOT NULL` operators and the `IFNULL()` function.

In SQL, the `NULL` value is never true in comparison to any other value, even `NULL`. An expression that contains `NULL` always produces a `NULL` value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return `NULL`:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

If you want to search for column values that are `NULL`, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for `NULL` values, you must use the `IS NULL` test. The following statements show how to find the `NULL` phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See [Section 3.3.4.6, “Working with NULL Values”](#), for additional information and examples.

You can add an index on a column that can have `NULL` values if you are using the `MyISAM`, `InnoDB`, or `BDB`, or `MEMORY` storage engine. Otherwise, you must declare an indexed column `NOT NULL`, and you cannot insert `NULL` into the column.

When reading data with `LOAD DATA INFILE`, empty or missing columns are updated with `' '`. If you want a `NULL` value in a column, you should use `\N` in the data file. The literal word “`NULL`” may also be used under some circumstances. See [Section 12.2.5, “LOAD DATA INFILE Syntax”](#).

When using `DISTINCT`, `GROUP BY`, or `ORDER BY`, all `NULL` values are regarded as equal.

When using `ORDER BY`, `NULL` values are presented first, or last if you specify `DESC` to sort in descending order.

Aggregate (summary) functions such as `COUNT()`, `MIN()`, and `SUM()` ignore `NULL` values. The exception to this is `COUNT(*)`, which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-`NULL` values in the `age` column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles `NULL` values specially. If you insert `NULL` into a `TIMESTAMP` column, the current date and time is inserted. If you insert `NULL` into an integer column that has the `AUTO_INCREMENT` attribute, the next number in the sequence is inserted.

B.1.5.4. Problems with Column Aliases

You can use an alias to refer to a column in `GROUP BY`, `ORDER BY`, or `HAVING` clauses. Aliases can also be used to give columns better names:

```
SELECT SQRT(a*b) AS root FROM tbl_name GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL doesn't allow you to refer to a column alias in a `WHERE` clause. This restriction is imposed because when the `WHERE` code is executed, the column value may not yet be determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name WHERE cnt > 0 GROUP BY id;
```

The `WHERE` statement is executed to determine which rows should be included in the `GROUP BY` part, whereas `HAVING` is used to decide which rows from the result set should be used.

B.1.5.5. Rollback Failure for Non-Transactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These non-transactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and non-transactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` doesn't support a storage engine, it instead creates the table as a `MyISAM` table, which is non-transactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See [Section 12.5.4.24, “SHOW TABLE STATUS Syntax”](#), and [Section 12.5.4.6, “SHOW CREATE TABLE Syntax”](#).

You can check which storage engines your `mysqld` server supports by using this statement:

```
SHOW ENGINES;
```

You can also use the following statement, and check the value of the variable that is associated with the storage engine in which you are interested:

```
SHOW VARIABLES LIKE 'have_%';
```

For example, to determine whether the `InnoDB` storage engine is available, check the value of the `have_innodb` variable.

See [Section 12.5.4.10, “SHOW ENGINES Syntax”](#), and [Section 12.5.4.27, “SHOW VARIABLES Syntax”](#).

MySQL Enterprise

Ensure that your data is adequately protected by subscribing to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

B.1.5.6. Deleting Rows from Related Tables

If the total length of the `DELETE` statement for `related_table` is more than 1MB (the default value of the `max_allowed_packet` system variable), you should split it into smaller parts and execute multiple `DELETE` statements. You probably get the fastest `DELETE` by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` isn't indexed, the speed is independent of the number of arguments in the `IN` clause.

B.1.5.7. Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that doesn't return any rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See [Section 6.2.1, “Optimizing Queries with EXPLAIN”](#).
2. Select only those columns that are used in the `WHERE` clause.
3. Remove one table at a time from the query until it returns some rows. If the tables are large, it's a good idea to use `LIMIT 10` with the query.
4. Issue a `SELECT` for the column that should have matched a row against the table that was last removed from the query.
5. If you are comparing `FLOAT` or `DOUBLE` columns with numbers that have decimals, you can't use equality (`=`) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the `FLOAT` to a `DOUBLE` fixes this. See [Section B.1.5.8, “Problems with Floating-Point Comparisons”](#).

Similar problems may be encountered when comparing `DECIMAL` values prior to MySQL 5.0.3.

6. If you still can't figure out what's wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

Verify that the test file demonstrates the problem by executing these commands:

```
shell> mysqladmin create test2
shell> mysql test2 < query.sql
```

Attach the test file to a bug report, which you can file using the instructions in [Section 1.8, “How to Report Bugs or Problems”](#).

B.1.5.8. Problems with Floating-Point Comparisons

Floating-point numbers sometimes cause confusion because they are approximate. That is, they are not stored as exact values inside computer architecture. What you can see on the screen usually is not the exact value of the number. The `FLOAT` and `DOUBLE` data types are such, and `DECIMAL` operations before MySQL 5.0.3 are approximate as well.

Prior to MySQL 5.0.3, `DECIMAL` columns store values with exact precision because they are represented as strings, but calculations on `DECIMAL` values are done using floating-point operations. As of 5.0.6, MySQL performs `DECIMAL` operations with a precision of 65 decimal digits (64 digits from 5.0.3 to 5.0.5), which should solve most common inaccuracy problems when it comes to

DECIMAL columns. (If your server is from MySQL 5.0.3 or higher, but you have **DECIMAL** columns in tables that were created before 5.0.3, the old behavior still applies to those columns. To convert the tables to the newer **DECIMAL** format, dump them with `mysqldump` and reload them.)

The following example (for versions of MySQL older than 5.0.3) demonstrates the problem. It shows that even for older **DECIMAL** columns, calculations that are done using floating-point operations are subject to floating-point error. (Were you to replace the **DECIMAL** columns with **FLOAT**, similar problems would occur for all versions of MySQL.)

```
mysql> CREATE TABLE t1 (i INT, d1 DECIMAL(9,2), d2 DECIMAL(9,2));
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
-> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
-> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
-> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
-> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
-> (6, 0.00, 0.00), (6, -51.40, 0.00);

mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
```

i	a	b
1	21.40	21.40
2	76.80	76.80
3	7.40	7.40
4	15.40	15.40
5	7.20	7.20
6	-51.40	0.00

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of **a** and **b** do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

As of MySQL 5.0.3, you will get only the last row in the above result.

The problem cannot be solved by using `ROUND()` or similar functions, because the result is still a floating-point number:

```
mysql> SELECT i, ROUND(SUM(d1), 2) AS a, ROUND(SUM(d2), 2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
```

i	a	b
1	21.40	21.40
2	76.80	76.80
3	7.40	7.40
4	15.40	15.40
5	7.20	7.20
6	-51.40	0.00

This is what the numbers in column **a** look like when displayed with more decimal places:

```
mysql> SELECT i, ROUND(SUM(d1), 2)*1.0000000000000000 AS a,
-> ROUND(SUM(d2), 2) AS b FROM t1 GROUP BY i HAVING a <> b;
```

i	a	b
1	21.3999999999999986	21.40
2	76.7999999999999972	76.80
3	7.4000000000000004	7.40
4	15.4000000000000004	15.40
5	7.2000000000000002	7.20
6	-51.399999999999986	0.00

Depending on your computer architecture, you may or may not see similar results. For example, on some machines you may get the “correct” results by multiplying both arguments by 1, as the following example shows.

Warning

Never use this method in your applications. It is not an example of a trustworthy method!

```
mysql> SELECT i, ROUND(SUM(d1), 2)*1 AS a, ROUND(SUM(d2), 2)*1 AS b
-> FROM t1 GROUP BY i HAVING a <> b;
```

i	a	b
6	-51.40	0.00

The reason that the preceding example seems to work is that on the particular machine where the test was done, CPU floating-point

arithmetic happens to round the numbers to the same value. However, there is no rule that any CPU should do so, so this method cannot be trusted.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) > 0.0001;
+-----+-----+-----+
| i | a | b |
+-----+-----+-----+
| 6 | -51.40 | 0.00 |
+-----+-----+-----+
1 row in set (0.00 sec)
```

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) <= 0.0001;
+-----+-----+-----+
| i | a | b |
+-----+-----+-----+
| 1 | 21.40 | 21.40 |
| 2 | 76.80 | 76.80 |
| 3 | 7.40 | 7.40 |
| 4 | 15.40 | 15.40 |
| 5 | 7.20 | 7.20 |
+-----+-----+-----+
```

B.1.6. Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL doesn't have enough information about the data at hand and has to make "educated" guesses about the data.

For the cases when MySQL does not do the "right" thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

```
mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
```

`EXPLAIN` is discussed in more detail in [Section 6.2.1, "Optimizing Queries with EXPLAIN"](#).

- Use `ANALYZE TABLE tbl_name` to update the key distributions for the scanned table. See [Section 12.5.2.1, "ANALYZE TABLE Syntax"](#).
- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

```
SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
WHERE t1.col_name=t2.col_name;
```

`USE INDEX` and `IGNORE INDEX` may also be useful. See [Section 12.2.7.2, "Index Hint Syntax"](#).

- Global and table-level `STRAIGHT_JOIN`. See [Section 12.2.7, "SELECT Syntax"](#).
- You can tune global or thread-specific system variables. For example, Start `mysqld` with the `-max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See [Section 5.2.3, "System Variables"](#).

MySQL Enterprise

For expert advice on configuring MySQL servers for optimal performance, subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

B.1.7. Table Definition-Related Issues

B.1.7.1. Problems with `ALTER TABLE`

`ALTER TABLE` changes a table to the current character set. If you get a duplicate-key error during `ALTER TABLE`, the cause is either that the new character sets maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table.

If `ALTER TABLE` dies with the following error, the problem may be that MySQL crashed during an earlier `ALTER TABLE` operation and there is an old table named `A-xxx` or `B-xxx` lying around:

```
Error on rename of './database/name.frm'
to './database/B-xxx.frm' (Errcode: 17)
```

In this case, go to the MySQL data directory and delete all files that have names starting with `A-` or `B-`. (You may want to move them elsewhere instead of deleting them.)

`ALTER TABLE` works in the following way:

- Create a new table named `A-xxx` with the requested structural changes.
- Copy all rows from the original table to `A-xxx`.
- Rename the original table to `B-xxx`.
- Rename `A-xxx` to your original table name.
- Delete `B-xxx`.

If something goes wrong with the renaming operation, MySQL tries to undo the changes. If something goes seriously wrong (although this shouldn't happen), MySQL may leave the old table as `B-xxx`. A simple rename of the table files at the system level should get your data back.

If you use `ALTER TABLE` on a transactional table or if you are using Windows or OS/2, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

B.1.7.2. How to Change the Order of Columns in a Table

First, consider whether you really need to change the column order in a table. The whole point of SQL is to abstract the application from the data storage format. You should always specify the order in which you wish to retrieve your data. The first of the following statements returns columns in the order `col_name1, col_name2, col_name3`, whereas the second returns them in the order `col_name1, col_name3, col_name2`:

```
mysql> SELECT col_name1, col_name2, col_name3 FROM tbl_name;
mysql> SELECT col_name1, col_name3, col_name2 FROM tbl_name;
```

If you decide to change the order of table columns anyway, you can do so as follows:

1. Create a new table with the columns in the new order.
2. Execute this statement:

```
mysql> INSERT INTO new_table
-> SELECT columns-in-new-order FROM old_table;
```

3. Drop or rename `old_table`.
4. Rename the new table to the original name:

```
mysql> ALTER TABLE new_table RENAME old_table;
```

`SELECT *` is quite suitable for testing queries. However, in an application, you should *never* rely on using `SELECT *` and retrieving the columns based on their position. The order and position in which columns are returned does not remain the same if you add, move, or delete columns. A simple change to your table structure could cause your application to fail.

B.1.7.3. TEMPORARY TABLE Problems

The following list indicates limitations on the use of `TEMPORARY` tables:

- A `TEMPORARY` table can only be of type `MEMORY`, `MyISAM`, `MERGE`, or `InnoDB`.

Temporary tables are not supported for MySQL Cluster.

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- You cannot use `RENAME` to rename a `TEMPORARY` table. However, you can use `ALTER TABLE` instead:

```
mysql> ALTER TABLE orig_name RENAME new_name;
```

- There are known issues in using temporary tables with replication. See [Section 15.3.1, “Replication Features and Issues”](#), for more information.

B.1.8. Known Issues in MySQL

This section is a list of the known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in [Section 2.4.19, “Operating System-Specific Notes”](#), and [MySQL Internals: Porting](#).

B.1.8.1. Open Issues in MySQL

The following problems are known and fixing them is a high priority:

- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).
- Dropping a `FOREIGN KEY` constraint doesn't work in replication because the constraint may have another name on the slave.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` doesn't work inside `GROUP_CONCAT()` if you don't use all and only those columns that are in the `DISTINCT` list.
- If one user has a long-running transaction and another user drops a table that is updated in the transaction, there is small chance that the binary log may contain the `DROP TABLE` command before the table is used in the transaction itself. We plan to fix this by having the `DROP TABLE` command wait until the table is not being used in any transaction.
- When inserting a big integer value (between 2^{63} and $2^{64}-1$) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.
- `FLUSH TABLES WITH READ LOCK` does not block `COMMIT` if the server is running without binary logging, which may cause a problem (of consistency between tables) when doing a full backup.
- `ANALYZE TABLE` on a `BDB` table may in some cases make the table unusable until you restart `mysqld`. If this happens, look for errors of the following form in the MySQL error file:

```
001207 22:07:56 bdb: log_flush: LSN past current end-of-log
```

- Don't execute `ALTER TABLE` on a `BDB` table on which you are running multiple-statement transactions until all those transactions complete. (The transaction might be ignored.)
- `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` may cause problems on tables for which you are using `INSERT DELAYED`.
- Performing `LOCK TABLE ...` and `FLUSH TABLES ...` doesn't guarantee that there isn't a half-finished transaction in progress on the table.
- `BDB` tables are relatively slow to open. If you have many `BDB` tables in a database, it takes a long time to use the `mysql` client

on the database if you are not using the `-A` option or if you are using `rehash`. This is especially noticeable when you have a large table cache.

- Replication uses query-level logging: The master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases.

It is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is non-deterministic (generally not a recommended practice, even outside of replication).

For example:

- `CREATE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
- `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
- `REPLACE ... SELECT, INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.

For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the master and slave.

A query is optimized differently on the master and slave only if:

- The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use `InnoDB` on the master, but `MyISAM` on the slave if the slave has less available disk space.)
- MySQL buffer sizes (`key_buffer_size`, and so on) are different on the master and slave.
- The master and slave run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using `mysqlbinlog|mysql`.

The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned non-deterministic queries to ensure that the rows are always stored or modified in the same order.

In future MySQL versions, we will automatically add an `ORDER BY` clause when needed.

The following issues are known and will be fixed in due time:

- Log filenames are based on the server hostname (if you don't specify a filename with the startup option). You have to use options such as `--log-bin=old_host_name-bin` if you change your hostname to something else. Another option is to rename the old files to reflect your hostname change (if these are binary logs, you need to edit the binary log index file and fix the binlog names there as well). See [Section 5.2.2, "Command Options"](#).
- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA INFILE` command. See [Section 7.11, "mysqlbinlog — Utility for Processing Binary Log Files"](#).
- `RENAME` doesn't work with `TEMPORARY` tables or tables used in a `MERGE` table.
- Due to the way table format (`.frm`) files are stored, you cannot use character 255 (`CHAR(255)`) in table names, column names, or enumerations. This is scheduled to be fixed in version 5.1 when we implement new table definition format files.
- When using `SET CHARACTER SET`, you can't use translated characters in database, table, and column names.
- You can't use “_” or “%” with `ESCAPE` in `LIKE ... ESCAPE`.
- You cannot build the server in another directory when using MIT-pthreads. Because this requires changes to MIT-pthreads, we are not likely to fix this. See [Section 2.4.15.5, "MIT-pthreads Notes"](#).
- `BLOB` and `TEXT` values can't reliably be used in `GROUP BY`, `ORDER BY` or `DISTINCT`. Only the first `max_sort_length` bytes are used when comparing `BLOB` values in these cases. The default value of `max_sort_length` is 1024 and can be changed at server startup time or at runtime.
- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF` and `ELT()` with `BIGINT` or

`DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.

- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- `mysqld_safe` redirects all messages from `mysqld` to the `mysqld` log. One problem with this is that if you execute `mysqladmin refresh` to close and reopen the log, `stdout` and `stderr` are still redirected to the old log. If you use `-log` extensively, you should edit `mysqld_safe` to log to `host_name.err` instead of `host_name.log` so that you can easily reclaim the space for the old log by deleting it and executing `mysqladmin refresh`.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by 2, **not 1**:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following doesn't work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns don't participate in the `DISTINCT` comparison. We will probably change this in the future to never compare the hidden columns when executing `DISTINCT`.

An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads
WHERE userid = 9 ORDER BY id DESC;
```

and

```
SELECT DISTINCT band_downloads.mp3id
FROM band_downloads,band_mp3
WHERE band_downloads.userid = 9
AND band_mp3.id = band_downloads.mp3id
ORDER BY band_downloads.id DESC;
```

In the second case, using MySQL Server 3.23.x, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

Note that this happens only for queries where that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` doesn't check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

B.2. Server Error Codes and Messages

MySQL programs have access to several types of error information when the server returns an error. For example, the `mysql` client program displays errors using the following format:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

The message displayed contains three types of information:

- A numeric error value (1146). This number is MySQL-specific and is not portable to other database systems.

- A five-character SQLSTATE value ('42S02'). The values are specified by ANSI SQL and ODBC and are more standardized. Not all MySQL error numbers are mapped to SQLSTATE error codes. The value 'HY000' (general error) is used for unmapped errors.
- A string that provides a textual description of the error.

Server error information comes from the following source files. For details about the way that error information is defined, see the MySQL Internals manual, available at <http://dev.mysql.com/doc/>.

- Error message information is listed in the `share/errmsg.txt` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the Message values when they are displayed.
- The Error values listed in `share/errmsg.txt` are used to generate the definitions in the `include/mysqld_error.h` and `include/mysqld_ename.h` MySQL source files.
- The SQLSTATE values listed in `share/errmsg.txt` are used to generate the definitions in the `include/sql_state.h` MySQL source file.

MySQL Enterprise

MySQL Enterprise subscribers will find numerous articles about server error messages at, [Error Messages](#). For information about subscribing to MySQL Enterprise see <http://www.mysql.com/products/enterprise/advisors.html>.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: 1000 SQLSTATE: HY000 (ER_HASHCHK)
Message: hashchk
- Error: 1001 SQLSTATE: HY000 (ER_NISAMCHK)
Message: isamchk
- Error: 1002 SQLSTATE: HY000 (ER_NO)
Message: NO
- Error: 1003 SQLSTATE: HY000 (ER_YES)
Message: YES
- Error: 1004 SQLSTATE: HY000 (ER_CANT_CREATE_FILE)
Message: Can't create file '%s' (errno: %d)
- Error: 1005 SQLSTATE: HY000 (ER_CANT_CREATE_TABLE)
Message: Can't create table '%s' (errno: %d)
- Error: 1006 SQLSTATE: HY000 (ER_CANT_CREATE_DB)
Message: Can't create database '%s' (errno: %d)
- Error: 1007 SQLSTATE: HY000 (ER_DB_CREATE_EXISTS)
Message: Can't create database '%s'; database exists
- Error: 1008 SQLSTATE: HY000 (ER_DB_DROP_EXISTS)
Message: Can't drop database '%s'; database doesn't exist
- Error: 1009 SQLSTATE: HY000 (ER_DB_DROP_DELETE)
Message: Error dropping database (can't delete '%s', errno: %d)
- Error: 1010 SQLSTATE: HY000 (ER_DB_DROP_RMDIR)
Message: Error dropping database (can't rmdir '%s', errno: %d)

- Error: 1011 SQLSTATE: HY000 ([ER_CANT_DELETE_FILE](#))
Message: Error on delete of '%s' (errno: %d)
- Error: 1012 SQLSTATE: HY000 ([ER_CANT_FIND_SYSTEM_REC](#))
Message: Can't read record in system table
- Error: 1013 SQLSTATE: HY000 ([ER_CANT_GET_STAT](#))
Message: Can't get status of '%s' (errno: %d)
- Error: 1014 SQLSTATE: HY000 ([ER_CANT_GET_WD](#))
Message: Can't get working directory (errno: %d)
- Error: 1015 SQLSTATE: HY000 ([ER_CANT_LOCK](#))
Message: Can't lock file (errno: %d)
- Error: 1016 SQLSTATE: HY000 ([ER_CANT_OPEN_FILE](#))
Message: Can't open file: '%s' (errno: %d)
- Error: 1017 SQLSTATE: HY000 ([ER_FILE_NOT_FOUND](#))
Message: Can't find file: '%s' (errno: %d)
- Error: 1018 SQLSTATE: HY000 ([ER_CANT_READ_DIR](#))
Message: Can't read dir of '%s' (errno: %d)
- Error: 1019 SQLSTATE: HY000 ([ER_CANT_SET_WD](#))
Message: Can't change dir to '%s' (errno: %d)
- Error: 1020 SQLSTATE: HY000 ([ER_CHECKREAD](#))
Message: Record has changed since last read in table '%s'
- Error: 1021 SQLSTATE: HY000 ([ER_DISK_FULL](#))
Message: Disk full (%s); waiting for someone to free some space...
- Error: 1022 SQLSTATE: 23000 ([ER_DUP_KEY](#))
Message: Can't write; duplicate key in table '%s'
- Error: 1023 SQLSTATE: HY000 ([ER_ERROR_ON_CLOSE](#))
Message: Error on close of '%s' (errno: %d)
- Error: 1024 SQLSTATE: HY000 ([ER_ERROR_ON_READ](#))
Message: Error reading file '%s' (errno: %d)
- Error: 1025 SQLSTATE: HY000 ([ER_ERROR_ON_RENAME](#))
Message: Error on rename of '%s' to '%s' (errno: %d)
- Error: 1026 SQLSTATE: HY000 ([ER_ERROR_ON_WRITE](#))
Message: Error writing file '%s' (errno: %d)
- Error: 1027 SQLSTATE: HY000 ([ER_FILE_USED](#))
Message: '%s' is locked against change
- Error: 1028 SQLSTATE: HY000 ([ER_FILSORT_ABORT](#))
Message: Sort aborted

- Error: 1029 SQLSTATE: HY000 ([ER_FORM_NOT_FOUND](#))
Message: View '%s' doesn't exist for '%s'
- Error: 1030 SQLSTATE: HY000 ([ER_GET_ERRNO](#))
Message: Got error %d from storage engine
- Error: 1031 SQLSTATE: HY000 ([ER_ILLEGAL_HA](#))
Message: Table storage engine for '%s' doesn't have this option
- Error: 1032 SQLSTATE: HY000 ([ER_KEY_NOT_FOUND](#))
Message: Can't find record in '%s'
- Error: 1033 SQLSTATE: HY000 ([ER_NOT_FORM_FILE](#))
Message: Incorrect information in file: '%s'
- Error: 1034 SQLSTATE: HY000 ([ER_NOT_KEYFILE](#))
Message: Incorrect key file for table '%s'; try to repair it
- Error: 1035 SQLSTATE: HY000 ([ER_OLD_KEYFILE](#))
Message: Old key file for table '%s'; repair it!
- Error: 1036 SQLSTATE: HY000 ([ER_OPEN_AS_READONLY](#))
Message: Table '%s' is read only
- Error: 1037 SQLSTATE: HY001 ([ER_OUTOFMEMORY](#))
Message: Out of memory; restart server and try again (needed %d bytes)
- Error: 1038 SQLSTATE: HY001 ([ER_OUT_OF_SORTMEMORY](#))
Message: Out of sort memory; increase server sort buffer size
- Error: 1039 SQLSTATE: HY000 ([ER_UNEXPECTED_EOF](#))
Message: Unexpected EOF found when reading file '%s' (errno: %d)
- Error: 1040 SQLSTATE: 08004 ([ER_CON_COUNT_ERROR](#))
Message: Too many connections
- Error: 1041 SQLSTATE: HY000 ([ER_OUT_OF_RESOURCES](#))
Message: Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use 'ulimit' to allow mysqld to use more memory or you can add more swap space
- Error: 1042 SQLSTATE: 08S01 ([ER_BAD_HOST_ERROR](#))
Message: Can't get hostname for your address
- Error: 1043 SQLSTATE: 08S01 ([ER_HANDSHAKE_ERROR](#))
Message: Bad handshake
- Error: 1044 SQLSTATE: 42000 ([ER_DBACCESS_DENIED_ERROR](#))
Message: Access denied for user '%s'@'%s' to database '%s'

Message: Name '%s' has become "

B.3. Client Error Codes and Messages

Client error information comes from the following source files:

- The Error values and the symbols in parentheses correspond to definitions in the `include/errmsg.h` MySQL source file.
- The Message values correspond to the error messages that are listed in the `libmysql/errmsg.c` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: 2000 (`CR_UNKNOWN_ERROR`)
Message: Unknown MySQL error
- Error: 2001 (`CR_SOCKET_CREATE_ERROR`)
Message: Can't create UNIX socket (%d)
- Error: 2002 (`CR_CONNECTION_ERROR`)
Message: Can't connect to local MySQL server through socket '%s' (%d)
- Error: 2003 (`CR_CONN_HOST_ERROR`)
Message: Can't connect to MySQL server on '%s' (%d)
- Error: 2004 (`CR_IPSOCK_ERROR`)
Message: Can't create TCP/IP socket (%d)
- Error: 2005 (`CR_UNKNOWN_HOST`)
Message: Unknown MySQL server host '%s' (%d)
- Error: 2006 (`CR_SERVER_GONE_ERROR`)
Message: MySQL server has gone away
- Error: 2007 (`CR_VERSION_ERROR`)
Message: Protocol mismatch; server version = %d, client version = %d
- Error: 2008 (`CR_OUT_OF_MEMORY`)
Message: MySQL client ran out of memory
- Error: 2009 (`CR_WRONG_HOST_INFO`)
Message: Wrong host info
- Error: 2010 (`CR_LOCALHOST_CONNECTION`)
Message: Localhost via UNIX socket
- Error: 2011 (`CR_TCP_CONNECTION`)
Message: %s via TCP/IP
- Error: 2012 (`CR_SERVER_HANDSHAKE_ERR`)
Message: Error in server handshake
- Error: 2013 (`CR_SERVER_LOST`)

Message: Lost connection to MySQL server during query

- Error: 2014 (CR_COMMANDS_OUT_OF_SYNC)

Message: Commands out of sync; you can't run this command now

- Error: 2015 (CR_NAMEDPIPE_CONNECTION)

Message: Named pipe: %s

- Error: 2016 (CR_NAMEDPIPEWAIT_ERROR)

Message: Can't wait for named pipe to host: %s pipe: %s (%lu)

- Error: 2017 (CR_NAMEDPIPEOPEN_ERROR)

Message: Can't open named pipe to host: %s pipe: %s (%lu)

- Error: 2018 (CR_NAMEDPIPESETSTATE_ERROR)

Message: Can't set state of named pipe to host: %s pipe: %s (%lu)

- Error: 2019 (CR_CANT_READ_CHARSET)

Message: Can't initialize character set %s (path: %s)

- Error: 2020 (CR_NET_PACKET_TOO_LARGE)

Message: Got packet bigger than 'max_allowed_packet' bytes

- Error: 2021 (CR_EMBEDDED_CONNECTION)

Message: Embedded server

- Error: 2022 (CR_PROBE_SLAVE_STATUS)

Message: Error on SHOW SLAVE STATUS:

- Error: 2023 (CR_PROBE_SLAVE_HOSTS)

Message: Error on SHOW SLAVE HOSTS:

- Error: 2024 (CR_PROBE_SLAVE_CONNECT)

Message: Error connecting to slave:

- Error: 2025 (CR_PROBE_MASTER_CONNECT)

Message: Error connecting to master:

- Error: 2026 (CR_SSL_CONNECTION_ERROR)

Message: SSL connection error

- Error: 2027 (CR_MALFORMED_PACKET)

Message: Malformed packet

- Error: 2028 (CR_WRONG_LICENSE)

Message: This client library is licensed only for use with MySQL servers having '%s' license

- Error: 2029 (CR_NULL_POINTER)

Message: Invalid use of null pointer

- Error: 2030 (CR_NO_PREPARE_STMT)

Message: Statement not prepared

- Error: 2031 (CR_PARAMS_NOT_BOUND)

Message: No data supplied for parameters in prepared statement

- Error: 2032 (CR_DATA_TRUNCATED)

Message: Data truncated

- Error: 2033 (CR_NO_PARAMETERS_EXISTS)

Message: No parameters exist in the statement

- Error: 2034 (CR_INVALID_PARAMETER_NO)

Message: Invalid parameter number

- Error: 2035 (CR_INVALID_BUFFER_USE)

Message: Can't send long data for non-string/non-binary data types (parameter: %d)

- Error: 2036 (CR_UNSUPPORTED_PARAM_TYPE)

Message: Using unsupported buffer type: %d (parameter: %d)

- Error: 2037 (CR_SHARED_MEMORY_CONNECTION)

Message: Shared memory: %s

- Error: 2038 (CR_SHARED_MEMORY_CONNECT_REQUEST_ERROR)

Message: Can't open shared memory; client could not create request event (%lu)

- Error: 2039 (CR_SHARED_MEMORY_CONNECT_ANSWER_ERROR)

Message: Can't open shared memory; no answer event received from server (%lu)

- Error: 2040 (CR_SHARED_MEMORY_CONNECT_FILE_MAP_ERROR)

Message: Can't open shared memory; server could not allocate file mapping (%lu)

- Error: 2041 (CR_SHARED_MEMORY_CONNECT_MAP_ERROR)

Message: Can't open shared memory; server could not get pointer to file mapping (%lu)

- Error: 2042 (CR_SHARED_MEMORY_FILE_MAP_ERROR)

Message: Can't open shared memory; client could not allocate file mapping (%lu)

- Error: 2043 (CR_SHARED_MEMORY_MAP_ERROR)

Message: Can't open shared memory; client could not get pointer to file mapping (%lu)

- Error: 2044 (CR_SHARED_MEMORY_EVENT_ERROR)

Message: Can't open shared memory; client could not create %s event (%lu)

- Error: 2045 (CR_SHARED_MEMORY_CONNECT_ABANDONED_ERROR)

Message: Can't open shared memory; no answer from server (%lu)

- Error: 2046 (CR_SHARED_MEMORY_CONNECT_SET_ERROR)

Message: Can't open shared memory; cannot send request event to server (%lu)

- Error: 2047 (CR_CONN_UNKNOW_PROTOCOL)

Message: Wrong or unknown protocol

- Error: 2048 (CR_INVALID_CONN_HANDLE)

Message: Invalid connection handle

- Error: 2049 (CR_SECURE_AUTH)

Message: Connection using old (pre-4.1.1) authentication protocol refused (client option 'secure_auth' enabled)

- Error: 2050 (CR_FETCH_CANCELED)

Message: Row retrieval was canceled by mysql_stmt_close() call

- Error: 2051 (CR_NO_DATA)

Message: Attempt to read column without prior row fetch

- Error: 2052 (CR_NO_STMT_METADATA)

Message: Prepared statement contains no metadata

- Error: 2053 (CR_NO_RESULT_SET)

Message: Attempt to read a row while there is no result set associated with the statement

- Error: 2054 (CR_NOT_IMPLEMENTED)

Message: This feature is not implemented yet

- Error: 2055 (CR_SERVER_LOST_EXTENDED)

Message: Lost connection to MySQL server at '%s', system error: %d

Appendix C. MySQL Enterprise Release Notes

This appendix lists the changes from version to version in MySQL Enterprise, including MySQL Enterprise Server. Releases in MySQL Enterprise Server are divided into the following release packs:

- *Rapid Update Service Packs* are issued once a month and incorporate all the bug fixes and security updates introduced since the previous MySQL Enterprise Server release. A single Service Pack can be used to update MySQL Enterprise Server; it is not necessary to install intervening service packs to bring your system up to date.
- *Quarterly Service Packs* are issued each quarter and incorporate all the bug fixes and security updates introduced since the previous MySQL Enterprise Server release. A single Service Pack can be used to update MySQL Enterprise Server; it is not necessary to install intervening service packs to bring your system up to date.
- *Hot-fix releases* incorporate fixes for bugs that caused significant issues that are not released as part of a Service Pack.

The Release Notes are updated as bugs are fixed and features are incorporated, so that everybody can follow the development process.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (<http://dev.mysql.com/downloads/>), it means that the version has not yet been released (and will normally be marked so in the appropriate Release Note section).

The date mentioned with a release version is the date of the last change done internally at MySQL AB (the BitKeeper ChangeSet) on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

For information on how to determine your current version and release type, see [Section 2.2, “Determining your current MySQL version”](#).

C.1. MySQL Enterprise 5.0 Release Notes

This section documents all changes and bug fixes, beginning with the first MySQL Enterprise Server release (5.0.28), that are made available through hot-fixes, and through service packs.

For a full list of changes, please refer to the changelog sections for each individual 5.0.x release.

C.1.1. Release Notes for MySQL Enterprise 5.0.52 (Not yet released)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.50). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Functionality added or changed:

- The default value of the `connect_timeout` system variable was increased from 5 to 10 seconds. This might help in cases where clients frequently encounter errors of the form `Lost connection to MySQL server at 'XXX', system error: errno`. ([Bug#28359](#))

Bugs fixed:

- The fix for [Bug#24989](#) introduced a problem such that a `NULL` thread handler could be used during a rollback operation. This problem is unlikely to be seen in practice. ([Bug#31517](#))
- Executing `RENAME` while tables were open for use with `HANDLER` statements could cause a server crash. ([Bug#31409](#))
- `mysql-test-run.pl` tried to create files in a directory where it could not be expected to have write permission. `mysqltest` created `.reject` files in a directory other than the one where test results go. ([Bug#31398](#))
- `CONVERT(val, DATETIME)` would fail on invalid input, but processing was not aborted for the `WHERE` clause, leading to a server crash. ([Bug#31253](#))

- Allocation of an insufficiently large group-by buffer following creation of a temporary table could lead to a server crash. (Bug#31249)
- Use of `DECIMAL(n, n) ZEROFILL` in `GROUP_CONCAT()` could cause a server crash. (Bug#31227)
- With small values of `myisam_sort_buffer_size`, `REPAIR TABLE` for `MyISAM` tables could cause a server crash. (Bug#31174)
- Use of the `@hostname` system variable in inserts in `mysql_system_tables_data.sql` did not replicate. The workaround is to select its value into a user variable (which does replicate) and insert that. (Bug#31167)
- Use of `GROUP_CONCAT(DISTINCT bit_column)` caused an assertion failure. (Bug#31154)
- Internal conversion routines could fail for several multi-byte character sets (`big5`, `cp932`, `euckr`, `gb2312`, `sjis`) for empty strings or during evaluation of `SOUNDS LIKE`. (Bug#31069, Bug#31070)
- A server crash could occur when a non-`DETERMINISTIC` stored function was used in a `GROUP BY` clause. (Bug#31035)
- On Windows, the `pthread_mutex_trylock()` implementation was incorrect. (Bug#30992)
- `MAKEDATE()` incorrectly moved year values in the 100-200 range into the 1970-2069 range. (This is legitimate for 00-99, but three-digit years should be used unchanged.) (Bug#30951)
- For `MEMORY` tables, lookups for `NULL` values in `BTREE` indexes could return incorrect results. (Bug#30885)
- Values for the `--tc-heuristic-recover` option incorrectly were treated as values for the `--myisam-stats-method` option. (Bug#30821)
- On Windows, the `pthread_mutex_trylock()` implementation was incorrect. One symptom was that invalidating the query cache could cause a server crash. (Bug#30768)
- For `MEMORY` tables, `DELETE` statements that remove rows based on an index read could fail to remove all matching rows. (Bug#30590)
- Versions of `mysqldump` from MySQL 4.1 or higher tried to use `START TRANSACTION WITH CONSISTENT SNAPSHOT` if the `--single-transaction` and `--master-data` options were given, even with servers older than 4.1 that do not support consistent snapshots. (Bug#30444)
- Specifying the `--without-geometry` option for `configure` caused server compilation to fail. (Bug#29972)
- Under some circumstances, a UDF initialization function could be passed incorrect argument lengths. (Bug#29804)
- The parser confused user-defined function (UDF) and stored function creation for `CREATE FUNCTION` and required that there be a default database when creating UDFs, although there is no such requirement. (Bug#28318, Bug#29816)
- `comp_err` created files with permissions such that they might be inaccessible during `make install` operations. (Bug#27789)
- Executing `FLUSH TABLES` while tables were open for use with `HANDLER` statements could cause a server crash. (Bug#21587)
- Hostnames sometimes were treated as case sensitive in account-management statements (`CREATE USER`, `GRANT`, `REVOKE`, and so forth). (Bug#19828)
- The `Aborted_clients` status variable was incremented twice if a client exited without calling `mysql_close()`. (Bug#16918)
- Clients were ignoring the TCP/IP port number specified as the default port via the `--with-tcp-port` configuration option. (Bug#15327)
- Values of types `REAL ZEROFILL`, `DOUBLE ZEROFILL`, `FLOAT ZEROFILL`, were not zero-filled when converted to a character representation in the C prepared statement API. (Bug#11589)
- Several buffer-size system variables were either being handled incorrectly for large values (for settings larger than 4GB, they were truncated to values less than 4GB without a warning), or were limited unnecessarily to 4GB even on 64-bit systems. The following changes were made:
 - For `key_buffer_size`, values larger than 4GB are allowed on 64-bit platforms (except Windows, for which large values are truncated to 4GB with a warning).
 - For `join_buffer_size`, `sort_buffer_size`, and `myisam_sort_buffer_size`, values are limited to 4GB on

all platforms. Larger values are truncated to 4GB with a warning.

In addition, settings for `read_buffer_size` and `read_rnd_buffer_size` are limited to 2GB on all platforms. Larger values are truncated to 2GB with a warning. ([Bug#5731](#), [Bug#29419](#), [Bug#29446](#))

C.1.2. Release Notes for MySQL Enterprise 5.0.50 (Not yet released)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.48). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Functionality added or changed:

- **MySQL Cluster:** Mapping of `NDB` error codes to storage engine error codes has been improved. ([Bug#28423](#))
- **MySQL Cluster:** The output from the cluster management client showing the progress of data node starts has been improved. ([Bug#23354](#))
- Server parser performance was improved for expression parsing by lowering the number of state state transitions and reductions needed. ([Bug#30625](#))
- Server parser performance was improved for boolean expressions. ([Bug#30237](#))

Bugs fixed:

- **MySQL Cluster:** Attempting to restore a backup made on a cluster host using one endian to a machine using the other endian could cause the cluster to fail. ([Bug#29674](#))
- **MySQL Cluster:** A query using joins between several large tables and requiring unique index lookups failed to complete, eventually returning `UNKNOWN ERROR` after a very long period of time. This occurred due to inadequate handling of instances where the Transaction Coordinator ran out of `TransactionBufferMemory`, when the cluster should have returned `NDB` error code 4012 (`REQUEST NDBD TIME-OUT`). ([Bug#28804](#))
- **MySQL Cluster:** The description of the `--print` option in the output from `ndb_restore --help` was incorrect. ([Bug#27683](#))
- **MySQL Cluster:** An invalid subselect on an `NDB` table could cause `mysqld` to crash. ([Bug#27494](#))
- For an `InnoDB` table if a `SELECT` was ordered by the primary key and also had a `WHERE field = value` clause on a different field that was indexed, a `DESC` order instruction would be ignored. ([Bug#31001](#))
- A failed `HANDLER ... READ` operation could leave the table in a locked state. ([Bug#30632](#))
- The optimization that uses a unique index to remove `GROUP BY` did not ensure that the index was actually used, thus violating the `ORDER BY` that is implied by `GROUP BY`. ([Bug#30596](#))
- `SHOW STATUS LIKE 'Ssl_cipher_list'` from a MySQL client connected via SSL returned an empty string rather than a list of available ciphers. ([Bug#30593](#))
- Issuing a `DELETE` statement having both an `ORDER BY` clause and a `LIMIT` clause could cause `mysqld` to crash. ([Bug#30385](#))
- The `Last_query_cost` status variable value can be computed accurately only for simple “flat” queries, not complex queries such as those with subqueries or `UNION`. However, the value was not consistently being set to 0 for complex queries. ([Bug#30377](#))
- Queries that had a `GROUP BY` clause and selected `COUNT(DISTINCT bit_column)` returned incorrect results. ([Bug#30324](#))
- Using `DISTINCT` or `GROUP BY` on a `BIT` column in a `SELECT` statement caused the column to be cast internally as an integer, with incorrect results being returned from the query. ([Bug#30245](#))
- Multiple-table `DELETE` statements could delete rows from the wrong table. ([Bug#30234](#))

- When `mysqldump` wrote `DROP DATABASE` statements within version-specific comments, it included the terminating semi-colon in the wrong place, causing following statements to fail when the dump file was reloaded. (Bug#30126)
- If a view used a function in its `SELECT` statement, the columns from the view were not inserted into the `INFORMATION_SCHEMA.COLUMNS` table. (Bug#29408)
- Reads on `BLOB` columns were not locked when they needed to be, in order to guarantee consistency. (Bug#29102)
- Killing an SSL connection on platforms where MySQL is compiled with `-DSIGNAL_WITH_VIO_CLOSE` (Windows, Mac OS X, and some others) could crash the server. (Bug#28812)
- A `SELECT` in one connection could be blocked by `INSERT ... ON DUPLICATE KEY UPDATE` in another connection even when `low_priority_updates` is set. (Bug#28587)
- `mysql_upgrade` could run binaries dynamically linked against incorrect versions of shared libraries. (Bug#28560)
- `SHOW COLUMNS` returned `NULL` instead of the empty string for the `Default` value of columns that had no default specified. (Bug#27747)
- With recent versions of `DBD::mysql`, `mysqlhotcopy` generated table names that were doubly qualified with the database name. (Bug#27694)
- An attempt to perform a `SELECT ... FROM INFORMATION_SCHEMA.TABLES` whose result included information about `NDB` tables for which the user had no privileges could crash the MySQL Server on which the query was performed. (Bug#26793)
- For `InnoDB` tables, `CREATE TABLE a AS SELECT * FROM A` would fail. (Bug#25164)
- Under heavy load with a large query cache, invalidating part of the cache could cause the server to freeze (that is, to be unable to service other operations until the invalidation was complete). (Bug#21074)
- Parameters of type `DATETIME` or `DATE` in stored procedures were silently converted to `VARBINARY`. (Bug#13675)

C.1.3. Release Notes for MySQL Enterprise 5.0.48 (27 August 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

Important

This release was withdrawn from production and is no longer available.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.46). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Functionality added or changed:

- If a `MyISAM` table is created with no `DATA DIRECTORY` option, the `.MYD` file is created in the database directory. By default, if `MyISAM` finds an existing `.MYD` file in this case, it overwrites it. The same applies to `.MYI` files for tables created with no `INDEX DIRECTORY` option. To suppress this behavior, start the server with the new `--keep_files_on_create` option, in which case `MyISAM` will not overwrite existing files and returns an error instead. (Bug#29325)
- The `EXAMPLE` storage engine is now enabled by default.

Bugs fixed:

- **MySQL Cluster:** The output from `ndb_config --config-file=file` was sent to `stdout` rather than `stderr`. (Bug#25941)
- **MySQL Cluster:** The server would not compile with `NDB` support on AIX 5.2. (Bug#10776)
- Memory corruption occurred for some queries with a top-level `OR` operation in the `WHERE` condition if they contained equality predicates and other sargable predicates in disjunctive parts of the condition. (Bug#30396)
- The server created temporary tables for filesort operations in the working directory, not in the directory specified by the `tmp-dir` system variable. (Bug#30287)

- The query cache does not support retrieval of statements for which column level access control applies, but the server was still caching such statements, thus wasting memory. (Bug#30269)
- `GROUP BY` on `BIT` columns produced incorrect results. (Bug#30219)
- Using `KILL QUERY` or `KILL CONNECTION` to kill a `SELECT` statement caused a server crash if the query cache was enabled. (Bug#30201)
- Prepared statements containing `CONNECTION_ID()` could be written improperly to the binary log. (Bug#30200)
- When a thread executing a `DROP TABLE` statement was killed, the table name locks that had been acquired were not released. (Bug#30193)
- Use of local variables with non-ASCII names in stored procedures crashed the server. (Bug#30120)
- On Windows, client libraries lacked symbols required for linking. (Bug#30118)
- For `MyISAM` tables on Windows, `INSERT`, `DELETE`, or `UPDATE` followed by `ALTER TABLE` within `LOCK TABLES` could cause table corruption. (Bug#29957)
- With auto-reconnect enabled, row fetching for a prepared statement could crash after reconnect occurred because loss of the statement handler was not accounted for. (Bug#29948)
- `LOCK TABLES` did not pre-lock tables used in triggers of the locked tables. Unexpected locking behavior and statement failures similar to `FAILED: 1100: TABLE 'XX' WAS NOT LOCKED WITH LOCK TABLES` could result. (Bug#29929)
- `INSERT ... VALUES(CONNECTION_ID(), ...)` statements were written to the binary log in such a way that they could not be properly restored. (Bug#29928)
- Adding `DISTINCT` could cause incorrect rows to appear in a query result. (Bug#29911)
- Using the `DATE()` function in a `WHERE` clause did not return any records after encountering `NULL`. However, using `TRIM` or `CAST` produced the correct results. (Bug#29898)
- Very long prepared statements in stored procedures could cause a server crash. (Bug#29856)
- `--myisam-recover=""` (empty option value) did not disable `MyISAM` recovery. (Bug#29856)
- If query execution involved a temporary table, `GROUP_CONCAT()` could return a result with an incorrect character set. (Bug#29850)
- If one thread was performing concurrent inserts, other threads reading from the same table using equality key searches could see the index values for new rows before the data values had been written, leading to reports of table corruption. (Bug#29838)
- Repeatedly accessing a view in a stored procedure (for example, in a loop) caused a small amount of memory to be allocated per access. Although this memory is deallocated on disconnect, it could be a problem for a long running stored procedures that make repeated access of views. (Bug#29834)
- Non-range queries of the form `SELECT ... FROM ... WHERE keypart_1=const, ..., keypart_n=const ORDER BY ... FOR UPDATE` sometimes were unnecessarily blocked waiting for a lock if another transaction was using `SELECT ... FOR UPDATE` on the same table. (Bug#29804)
- `mysqldump` produced output that incorrectly discarded the `NO_AUTO_VALUE_ON_ZERO` value of the `SQL_MODE` variable after dumping triggers. (Bug#29788)
- An assertion failure occurred within `yaSSL` for very long keys. (Bug#29784)
- For `MEMORY` tables, the `index_merge` union access method could return incorrect results. (Bug#29740)
- Comparison of `TIME` values using the `BETWEEN` operator led to string comparison, producing incorrect results in some cases. Now the values are compared as integers. (Bug#29739)
- The thread ID was not reset properly after execution of `mysql_change_user()`, which could cause replication failure when replicating temporary tables. (Bug#29734)
- For a table with a `DATE` column `date_col` such that selecting rows with `WHERE date_col = 'date_val 00:00:00'` yielded a non-empty result, adding `GROUP BY date_col` caused the result to be empty. (Bug#29729)
- In some cases, `INSERT INTO ... SELECT ... GROUP BY` could insert rows even if the `SELECT` by itself produced an empty result. (Bug#29717)

- For the embedded server, the `mysql_stmt_store_result()` C API function caused a memory leak for empty result sets. (Bug#29687)
- `EXPLAIN` produced `Impossible where` for statements of the form `SELECT ... FROM t WHERE c=0`, where `c` was an `ENUM` column defined as a primary key. (Bug#29661)
- On Windows, `ALTER TABLE` hung if records were locked in share mode by a long-running transaction. (Bug#29644)
- A left join between two views could produce incorrect results. (Bug#29604)
- Certain statements with unions, subqueries, and joins could result in huge memory consumption. (Bug#29582)
- Clients using SSL could hang the server. (Bug#29579)
- A slave running with `--log-slave-updates` would fail to write `INSERT DELAY IGNORE` statements to its binary log, resulting in different binary log contents on the master and slave. (Bug#29571)
- An incorrect result was returned when comparing string values that were converted to `TIME` values with `CAST()`. (Bug#29555)
- Operations that used the time zone replicated the time zone only for successful operations, but did not replicate the time zone for errors that need to know it. (Bug#29536)
- Conversion of ASCII DEL (0x7F) to Unicode incorrectly resulted in QUESTION MARK (0x3F) rather than DEL. (Bug#29499)
- A field packet with `NULL` fields caused a `libmysqlclient` crash. (Bug#29494)
- When using a combination of `HANDLER... READ` and `DELETE` on a table, MySQL continued to open new copies of the table every time, leading to an exhaustion of file descriptors. (Bug#29474)

This regression was introduced by Bug#21587

- On Windows, the `mysql` client died if the user entered a statement and Return after entering Control-C. (Bug#29469)
- Failure to consider collation when comparing space characters could lead to incorrect index entry order, making it impossible to find some index values. (Bug#29461)
- Killing an `INSERT DELAYED` thread caused a server crash. (Bug#29431)
- The special “zero” `ENUM` value was coerced to the normal empty string `ENUM` value during a column-to-column copy. This affected `CREATE ... SELECT` statements and `SELECT` statements with aggregate functions on `ENUM` columns in the `GROUP BY` clause. (Bug#29360)
- Optimization of queries with `DETERMINISTIC` stored functions in the `WHERE` clause was ineffective: A sequential scan was always used. (Bug#29338)
- `MyISAM` corruption could occur with the `cp932_japanese_ci` collation for the `cp932` character set due to incorrect comparison for trailing space. (Bug#29333)
- The `mysql_list_fields()` C API function incorrectly set `MYSQL_FIELD::decimals` for some view columns. (Bug#29306)
- `InnoDB` refused to start on some versions of FreeBSD with LinuxThreads. This is fixed by enabling file locking on FreeBSD. (Bug#29155)
- `INSERT DELAYED` statements on a master server are replicated as non-`DELAYED` inserts on slaves (which is normal, to preserve serialization), but the inserts on the slave did not use concurrent inserts. Now `INSERT DELAYED` on a slave is converted to a concurrent insert when possible, and to a normal insert otherwise. (Bug#29152)
- A maximum of 4TB `InnoDB` free space was reported by `SHOW TABLE STATUS`, which is incorrect on systems with more than 4TB space. (Bug#29097)
- A byte-order issue in writing a spatial index to disk caused bad index files on some systems. (Bug#29070)
- Creation of a legal stored procedure could fail if no default database had been selected. (Bug#29050)
- Coercion of ASCII values to character sets that are a superset of ASCII sometimes was not done, resulting in `ILLEGAL MIX OF COLLATIONS` errors. These cases now are resolved using repertoire, a new string expression attribute (see Section 9.6, “String Repertoire”). (Bug#28875)

- Fast `ALTER TABLE` (that works without rebuilding the table) acquired duplicate locks in the storage engine. In `MyISAM`, if `ALTER TABLE` was issued under `LOCK TABLE`, it caused all data inserted after `LOCK TABLE` to disappear. (Bug#28838)
- Tables using the `InnoDB` storage engine incremented `AUTO_INCREMENT` values incorrectly with `ON DUPLICATE KEY UPDATE`. (Bug#28781)
- For `InnoDB` tables, MySQL unnecessarily sorted records in certain cases when the records were retrieved by `InnoDB` in the proper order already. (Bug#28591)
- `mysql_install_db` could fail to find script files that it needs. (Bug#28585)
- Statements within stored procedures ignored the value of the `low_priority_updates` system variable. (Bug#28570)
- If a stored procedure was created and invoked prior to selecting a default database with `USE`, a `NO DATABASE SELECTED` error occurred. (Bug#28551)
- On Mac OS X, shared-library installation pathnames were incorrect. (Bug#28544)
- Using the `--skip-add-drop-table` option with `mysqldump` generated incorrect SQL if the database included any views. The recreation of views requires the creation and removal of temporary tables. This option suppressed the removal of those temporary tables. The same applied to `--compact` since this option also invokes `--skip-add-drop-table`. (Bug#28524)
- The `IS_UPDATABLE` column in the `INFORMATION_SCHEMA.VIEWS` table was not always set correctly. (Bug#28266)
- A race condition in the interaction between `MyISAM` and the query cache code caused the query cache not to invalidate itself for concurrently inserted data. (Bug#28249)
- Indexing column prefixes in `InnoDB` tables could cause table corruption. (Bug#28138)
- Index creation could fail due to truncation of key values to the maximum key length rather than to a multiple of the maximum character length. (Bug#28125)
- Some `SHOW` statements and `INFORMATION_SCHEMA` queries could expose information not allowed by the user's access privileges. (Bug#27629)
- Some character mappings in the `ascii.xml` file were incorrect. (Bug#27562)
- An error that happened inside `INSERT`, `UPDATE`, or `DELETE` statements performed from within a stored function or trigger could cause inconsistency between master and slave servers. (Bug#27417)
- A `SELECT` with more than 31 nested dependent subqueries returned an incorrect result. (Bug#27352)
- `INSERT INTO ... SELECT` caused a crash if `innodb_locks_unsafe_for_binlog` was enabled. (Bug#27294)
- `FEDERATED` tables had an artificially low maximum of key length. (Bug#26909)
- After the first read of a `TEMPORARY` table, `CHECK TABLE` could report the table as being corrupt. (Bug#26325)
- If an operation had an `InnoDB` table, and two triggers, `AFTER UPDATE` and `AFTER INSERT`, competing for different resources (such as two distinct `MyISAM` tables), the triggers were unable to execute concurrently. In addition, `INSERT` and `UPDATE` statements for the `InnoDB` table were unable to run concurrently. (Bug#26141)
- `ALTER DATABASE` did not require at least one option. (Bug#25859)
- Using `HANDLER` to open a table having a storage engine not supported by `HANDLER` properly returned an error, but also improperly prevented the table from being dropped by other connections. (Bug#25856)
- When using a `FEDERATED` table, the value of `last_insert_id()` would not correctly update the C API interface, which would affect the autogenerated ID returned both through the C API and the MySQL protocol, affecting Connectors that used the protocol and/or C API. (Bug#25714)
- The server was blocked from opening other tables while the `FEDERATED` engine was attempting to open a remote table. Now the server does not check the correctness of a `FEDERATED` table at `CREATE TABLE` time, but waits until the table actually is accessed. (Bug#25679)
- Several `InnoDB` assertion failures were corrected. (Bug#25645)
- In a stored function or trigger, when `InnoDB` detected deadlock, it attempted rollback and displayed an incorrect error message (`EXPLICIT OR IMPLICIT COMMIT IS NOT ALLOWED IN STORED FUNCTION OR TRIGGER`). Now `InnoDB` returns an error under these conditions and does not attempt rollback. Rollback is handled outside of `InnoDB` above the function/trigger level.

[Bug#24989](#)

- Dropping a temporary `InnoDB` table that had been locked with `LOCK TABLES` caused a server crash. ([Bug#24918](#))
- On Windows, executables did not include Vista manifests. ([Bug#24732](#))
- Slave servers could incorrectly interpret an out-of-memory error from the master and reconnect using the wrong binary log position. ([Bug#24192](#))
- If MySQL/`InnoDB` crashed very quickly after starting up, it would not force a checkpoint. In this case, `InnoDB` would skip crash recovery at next startup, and the database would become corrupt. Fix: If the redo log scan at `InnoDB` startup goes past the last checkpoint, force crash recovery. ([Bug#23710](#))
- `SHOW INNODB STATUS` caused an assertion failure under high load. ([Bug#22819](#))
- A statement of the form `CREATE TABLE IF NOT EXISTS t1 SELECT f1() AS i` failed with a deadlock error if the stored function `f1()` referred to a table with the same name as the to-be-created table. Now it correctly produces a message that the table already exists. ([Bug#22427](#))
- Read lock requests that were blocked by a pending write lock request were not allowed to proceed if the statement requesting the write lock was killed. ([Bug#21281](#))
- `mysql-stress-test.pl` and `mysqld_multi.server.sh` were missing from some binary distributions. ([Bug#21023](#), [Bug#25486](#))
- On Windows, the server used 10MB of memory for each connection thread, resulting in memory exhaustion. Now each thread uses 1MB. ([Bug#20815](#))
- `InnoDB` produced an unnecessary (and harmless) warning: `InnoDB: Error: trying to declare trx to enter InnoDB, but InnoDB: it already is declared.` ([Bug#20090](#))
- `SQL_BIG_RESULT` had no effect for `CREATE TABLE ... SELECT SQL_BIG_RESULT ...` statements. ([Bug#15130](#))
- `mysql_setpermission` tried to grant global-only privileges at the database level. ([Bug#14618](#))
- For the general query log, logging of prepared statements executed via the C API differed from logging of prepared statements performed with `PREPARE` and `EXECUTE`. Logging for the latter was missing the `Prepare` and `Execute` lines. ([Bug#13326](#))
- Backup software can cause `ERROR_SHARING_VIOLATION` or `ERROR_LOCK_VIOLATION` conditions during file operations. `InnoDB` now retries forever until the condition goes away. ([Bug#9709](#))

C.1.4. Release Notes for MySQL Enterprise 5.0.46 (13 July 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.44). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Functionality added or changed:

- If a `MERGE` table cannot be opened or used because of a problem with an underlying table, `CHECK TABLE` now displays information about which table caused the problem. ([Bug#26976](#))
- The `SQL_MODE`, `FOREIGN_KEY_CHECKS`, `UNIQUE_CHECKS`, character set/collations, and `SQL_AUTO_IS_NULL` session variables are written to the binary log and honoured during replication. See [Section 5.11.3, “The Binary Log”](#).

Bugs fixed:

- **MySQL Cluster:** When restarting a data node, queries could hang during that node's start phase 5, and only continue once the node entered phase 6. ([Bug#29364](#))
- **MySQL Cluster:** The management client's response to `START BACKUP WAIT COMPLETED` did not include the backup ID. ([Bug#27640](#))
- On the IBM i5 platform, the installation script in *SAVF binaries unconditionally executed the `mysql_install_db` script.

[Bug#30084](#)

- `gcov` coverage-testing information was not written if the server crashed. ([Bug#29543](#))
- Corrupt data resulted from use of `SELECT ... INTO OUTFILE 'file_name' FIELDS ENCLOSED BY 'c'`, where `c` is a digit or minus sign, followed by `LOAD DATA INFILE 'file_name' FIELDS ENCLOSED BY 'c'`. ([Bug#29442](#))
- Use of `SHOW BINLOG EVENTS` for a non-existent log file followed by `PURGE MASTER LOGS` caused a server crash. ([Bug#29420](#))
- Assertion failure could occur for grouping queries that employed `DECIMAL` user variables with assignments to them. ([Bug#29417](#))
- For `CAST(expr AS DECIMAL(M,D))`, the limits of 65 and 30 on the precision (`M`) and scale (`D`) were not enforced. ([Bug#29415](#))
- Results for a select query that aliases the column names against a view could duplicate one column while omitting another. This bug could occur for a query over a multiple-table view that includes an `ORDER BY` clause in its definition. ([Bug#29392](#))
- `mysqldump` created a stray file when a given a too-long filename argument. ([Bug#29361](#))
- `FULLTEXT` indexes could be corrupted by certain `gbk` characters. ([Bug#29299](#))
- `SELECT ... INTO OUTFILE` followed by `LOAD DATA` could result in garbled characters when the `FIELDS ENCLOSED BY` clause named a delimiter of `'0'`, `'b'`, `'n'`, `'r'`, `'t'`, `'N'`, or `'Z'` due to an interaction of character encoding and doubling for data values containing the enclosed-by character. ([Bug#29294](#))
- Sort order of the collation wasn't used when comparing trailing spaces. This could lead to incorrect comparison results, incorrectly created indexes, or incorrect result set order for queries that include an `ORDER BY` clause. ([Bug#29261](#))
- If an `ENUM` column contained `'` as one of its members (represented with numeric value greater than 0), and the column contained error values (represented as 0 and displayed as `'`), using `ALTER TABLE` to modify the column definition caused the 0 values to be given the numeric value of the non-zero `'` member. ([Bug#29251](#))
- Calling `mysql_options()` after `mysql_real_connect()` could cause clients to crash. ([Bug#29247](#))
- `CHECK TABLE` for `ARCHIVE` tables could falsely report table corruption or cause a server crash. ([Bug#29207](#))
- Mixing binary and `utf8` columns in a union caused field lengths to be calculated incorrectly, resulting in truncation. ([Bug#29205](#))
- `AsText()` could fail with a buffer overrun. ([Bug#29166](#))
- `LOCK TABLES` was not atomic when more than one `InnoDB` tables were locked. ([Bug#29154](#))
- A network structure was initialized incorrectly, leading to embedded server crashes. ([Bug#29117](#))
- An assertion failure occurred if a query contained a conjunctive predicate of the form `view_column = constant` in the `WHERE` clause and the `GROUP BY` clause contained a reference to a different view column. The fix also enables application of an optimization that was being skipped if a query contained a conjunctive predicate of the form `view_column = constant` in the `WHERE` clause and the `GROUP BY` clause contained a reference to the same view column. ([Bug#29104](#))
- If an `INSERT INTO ... SELECT` statement inserted into the same table that the `SELECT` retrieved from, and the `SELECT` included `ORDER BY` and `LIMIT` clauses, different data was inserted than the data produced by the `SELECT` executed by itself. ([Bug#29095](#))
- Queries that performed a lookup into a `BINARY` index containing key values ending with spaces caused an assertion failure for debug builds and incorrect results for non-debug builds. ([Bug#29087](#))
- The semantics of `BIGINT` depended on platform-specific characteristics. ([Bug#29079](#))
- If one of the queries in a `UNION` used the `SQL_CACHE` option and another query in the `UNION` contained a nondeterministic function, the result was still cached. For example, this query was incorrectly cached:

```
SELECT NOW() FROM t1 UNION SELECT SQL_CACHE 1 FROM t1;
```

([Bug#29053](#))

- `DROP USER` statements that named multiple users, only some of which could be dropped, were replicated incorrectly. ([Bug#29030](#))

- `REPLACE`, `INSERT IGNORE`, and `UPDATE IGNORE` did not work for `FEDERATED` tables. (Bug#29019)
- Inserting into `InnoDB` tables and executing `RESET MASTER` in multiple threads cause assertion failure in debug server binaries. (Bug#28983)
- For a `ucs2` column, `GROUP_CONCAT()` did not convert separators to the result character set before inserting them, producing a result containing a mixture of two different character sets. (Bug#28925)
- Queries using UDFs or stored functions were cached. (Bug#28921)
- For a join with `GROUP BY` and/or `ORDER BY` and a view reference in the `FROM` list, the query metadata erroneously showed empty table aliases and database names for the view columns. (Bug#28898)
- Non-`utf8` characters could get mangled when stored in `CSV` tables. (Bug#28862)
- `ALTER VIEW` is not supported as a prepared statement but was not being rejected. `ALTER VIEW` is now prohibited as a prepared statement or when called within stored routines. (Bug#28846)
- In strict SQL mode, errors silently stopped the SQL thread even for errors named using the `--slave-skip-errors` option. (Bug#28839)
- Runtime changes to the `log_queries_not_using_indexes` system variable were ignored. (Bug#28808)
- Selecting a column not present in the selected-from table caused an extra error to be produced by `SHOW ERRORS`. (Bug#28677)
- For a statement of the form `CREATE t1 SELECT integer_constant`, the server created the column using the `DECIMAL` data type for large negative values that are within the range of `BIGINT`. (Bug#28625)
- When one thread attempts to lock two (or more) tables and another thread executes a statement that aborts these locks (such as `REPAIR TABLE`, `OPTIMIZE TABLE`, or `CHECK TABLE`), the thread might get a table object with an incorrect lock type in the table cache. The result is table corruption or a server crash. (Bug#28574)
- `mysqlbinlog --hexdump` generated incorrect output due to omission of the “#” comment character for some comment lines. (Bug#28293)
- The `LOCATE()` function returned `NULL` if any of its arguments evaluated to `NULL`. Likewise, the predicate, `LOCATE(str, NULL) IS NULL`, erroneously evaluated to `FALSE`. (Bug#27932)
- The modification of a table by a partially completed multi-column update was not recorded in the binlog, rather than being marked by an event and a corresponding error code. (Bug#27716)
- A stack overrun could occur when storing `DATETIME` values using repeated prepared statements. (Bug#27592)
- Dropping a user-defined function could cause a server crash if the function was still in use by another thread. (Bug#27564)
- Fixed a case of unsafe aliasing in the source that caused a client library crash when compiled with `gcc 4` at high optimization levels. (Bug#27383)
- Index-based range reads could fail for comparisons that involved contraction characters (such as `ch` in Czech or `ll` in Spanish). (Bug#27345)
- Aggregations in subqueries that refer to outer query columns were not always correctly referenced to the proper outer query. (Bug#27333)
- Error returns from the `time()` system call were ignored. (Bug#27198)
- Phantom reads could occur under `InnoDB` serializable isolation level. (Bug#27197)
- The `SUBSTRING()` function returned the entire string instead of an empty string when it was called from a stored procedure and when the length parameter was specified by a variable with the value “0”. (Bug#27130)
- `ALTER TABLE ... ENABLE KEYS` could cause `mysqld` to crash when executed on a table containing on a `MyISAM` table containing billions of rows. (Bug#27029)
- Binary content `0x00` in a `BLOB` column sometimes became `0x5C 0x00` following a dump and reload, which could cause problems with data using multi-byte character sets such as `GBK` (Chinese). This was due to a problem with `SELECT INTO OUTFILE` whereby `LOAD DATA` later incorrectly interpreted `0x5C` as the second byte of a multi-byte sequence rather than as the `SOLIDUS` (“\”) character, used by MySQL as the escape character. (Bug#26711)
- Index creation could corrupt the table definition in the `.frm` file: 1) A table with the maximum number of key segments and

maximum length key name would have a corrupted `.frm` file, due to incorrect calculation of the total key length. 2) `MyISAM` would reject a table with the maximum number of keys and the maximum number of key segments in all keys. (It would allow one less than this total maximum.) Now `MyISAM` accepts a table defined with the maximum. (Bug#26642)

- `auto_increment_increment` and `auto_increment_offset` are now supported for `NDB` tables. (Bug#26342)
- The index merge union access algorithm could produce incorrect results with `InnoDB` tables. The problem could also occur for queries that used `DISTINCT`. (Bug#25798)
- Under ActiveState Perl, `mysql-test-run.pl` could kill itself when attempting to kill other processes. (Bug#25657)
- A query with `DISTINCT` in the select list to which the loose-scan optimization for grouping queries was applied returned an incorrect result set when the query was used with the `SQL_BIG_RESULT` option. (Bug#25602)
- For a multiple-row insert into a `FEDERATED` table that refers to a remote transactional table, if the insert failed for a row due to constraint failure, the remote table would contain a partial commit (the rows preceding the failed one) instead of rolling back the statement completely. This occurred because the rows were treated as individual inserts.

Now `FEDERATED` performs bulk-insert handling such that multiple rows are sent to the remote table in a batch. This provides a performance improvement and enables the remote table to perform statement rollback properly should an error occur. This capability has the following limitations:

- The size of the insert cannot exceed the maximum packet size between servers. If the insert exceeds this size, it is broken into multiple packets and the rollback problem can occur.
- Bulk-insert handling does not occur for `INSERT ... ON DUPLICATE KEY UPDATE`.

(Bug#25513)

- The `FEDERATED` storage engine failed silently for `INSERT ... ON DUPLICATE KEY UPDATE` if a duplicate key violation occurred. `FEDERATED` does not support `ON DUPLICATE KEY UPDATE`, so now it correctly returns an `ER_DUP_KEY` error if a duplicate key violation occurs. (Bug#25511)
- A too-long `shared-memory-base-name` value could cause a buffer overflow and crash the server or clients. (Bug#24924)
- The server deducted some bytes from the `key_cache_block_size` option value and reduced it to the next lower 512 byte boundary. The resulting block size was not a power of two. Setting the `key_cache_block_size` system variable to a value that is not a power of two resulted in `MyISAM` table corruption. (Bug#23068, Bug#28478, Bug#25853)
- `SHOW BINLOG EVENTS` displayed incorrect values of `End_log_pos` for events associated with transactional storage engines. (Bug#22540)
- Under ActiveState Perl, `mysql-test-run.pl` would not run. (Bug#18415)
- The server crashed when the size of an `ARCHIVE` table grew larger than 2GB. (Bug#15787)
- On 64-bit Windows systems, the Config Wizard failed to complete the setup because 64-bit Windows does not resolve dynamic linking of the 64-bit `libmysql.dll` to a 32-bit application like the Config Wizard. (Bug#14649)
- The server returned data from `SHOW CREATE TABLE` statement or a `SELECT` statement on an `INFORMATION_SCHEMA` table using the `binary` character set. (Bug#10491)
- A problem with the fix for Bug#29354 caused an assertion when two local checkpoints were run during node recovery.
- Bulk-insert handling does not occur for `INSERT ... ON DUPLICATE KEY UPDATE`.
- The size of the insert cannot exceed the maximum packet size between servers. If the insert exceeds this size, it is broken into multiple packets and the rollback problem can occur.

C.1.5. Release Notes for MySQL Enterprise 5.0.44sp1 (01 August 2007)

This is a *Service Pack* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.44).

Functionality added or changed:

- **MySQL Cluster:** The server source tree now includes scripts to simplify building MySQL with SCI support. For more information about SCI interconnects and these build scripts, see [Section 16.9.1, “Configuring MySQL Cluster to use SCI Sockets”](#).

Bug#25470)

- Enterprise builds did not include the `CSV` storage engine. `CSV` is now included in Enterprise builds for all platforms except Windows, QNX, and NetWare. (Bug#28844)
- A new status variable, `Com_call_procedure`, indicates the number of calls to stored procedures. (Bug#27994)

Bugs fixed:

- **Security Fix:** A malformed password packet in the connection protocol could cause the server to crash. Thanks for Dormando for reporting this bug and providing details and a proof of concept. (Bug#28984)
- **Security Fix:** `CREATE TABLE LIKE` did not require any privileges on the source table. Now it requires the `SELECT` privilege.

In addition, `CREATE TABLE LIKE` was not isolated from alteration by other connections, which resulted in various errors and incorrect binary log order when trying to execute concurrently a `CREATE TABLE LIKE` statement and either DDL statements on the source table or DML or DDL statements on the target table. (Bug#23667, Bug#25578, CVE-2007-3781)

- **Incompatible Change:** When `mysqldump` was run with the `--delete-master-logs` option, binary log files were deleted before it was known that the dump had succeeded, not after. (The method for removing log files used `RESET MASTER` prior to the dump. This also reset the binary log sequence numbering to `.000001`.) Now `mysqldump` flushes the logs (which creates a new binary log number with the next sequence number), performs the dump, and then uses `PURGE MASTER LOGS` to remove the log files older than the new one. This also preserves log numbering because the new log with the next number is generated and only the preceding logs are removed. However, this may affect applications if they rely on the log numbering sequence being reset. (Bug#24733)
- **Incompatible Change:** The use of an `ORDER BY` or `DISTINCT` clause with a query containing a call to the `GROUP_CONCAT()` function caused results from previous queries to be redisplayed in the current result. The fix for this includes replacing a `BLOB` value used internally for sorting with a `VARCHAR`. This means that for long results (more than 65,535 bytes), it is possible for truncation to occur; if so, an appropriate warning is issued. (Bug#23856, Bug#28273)
- **MySQL Cluster:** A corrupt schema file could cause a `FILE ALREADY OPEN` error. (Bug#28770)
- **MySQL Cluster:** A race condition could result when non-master nodes (in addition to the master node) tried to update active status due to a local checkpoint. Now only the master updates the active status. (Bug#28717)
- **MySQL Cluster:** A fast global checkpoint under high load with a high usage of the redo buffer caused data nodes to fail. (Bug#28653)
- **MySQL Cluster:** When an API node sent more than 1024 signals in a single batch, `NDB` would process only the first 1024 of these, and then hang. (Bug#28443)
- **MySQL Cluster:** A delay in obtaining `AUTO_INCREMENT` IDs could lead to excess temporary errors. (Bug#28410)
- **MySQL Cluster:** A failure to release internal resources following an error could lead to problems with single user mode. (Bug#25818)
- On the IBM i5 platform, the installation script in `*SAVF` binaries unconditionally executed the `mysql_install_db` script. This problem was fixed in a repackaged distribution numbered 5.0.44b. (Bug#30084)
- Long pathnames for internal temporary tables could cause stack overflows. (Bug#29015)
- Using an `INTEGER` column from a table to `ROUND()` a number produced different results than using a constant with the same value as the `INTEGER` column. (Bug#28980)
- If a program binds a given number of parameters to a prepared statement handle and then somehow changes `stmt->param_count` to a different number, `mysql_stmt_execute()` could crash the client or server. (Bug#28934)
- `INSERT .. ON DUPLICATE KEY UPDATE` could under some circumstances silently update rows when it should not have. (Bug#28904)
- Queries that used `UUID()` were incorrectly allowed into the query cache. (This should not happen because `UUID()` is non-deterministic.) (Bug#28897)
- Using a `VIEW` created with a non-existing `DEFINER` could lead to incorrect results under some circumstances. (Bug#28895)
- For `InnoDB` tables that use the `utf8` character set, incorrect results could occur for DML statements such as `DELETE` or `UPDATE` that use an index on character-based columns. (Bug#28878)

See also [Bug#29449](#), [Bug#30485](#), [Bug#31395](#)

This regression was introduced by [Bug#13195](#)

- On Windows, `USE_TLS` was not defined for `mysqlclient.lib`. ([Bug#28860](#))
- A subquery with `ORDER BY` and `LIMIT 1` could cause a server crash. ([Bug#28811](#))
- Using `BETWEEN` with non-indexed date columns and short formats of the date string could return incorrect results. ([Bug#28778](#))
- Selecting `GEOMETRY` columns in a `UNION` caused a server crash. ([Bug#28763](#))
- When constructing the path to the original `.frm` file, `ALTER ... RENAME` was unnecessarily (and incorrectly) lowercasing the entire path when not on a case-insensitive filesystem, causing the statement to fail. ([Bug#28754](#))
- The actual value of `MaxNoOfOpenFiles` as used by the cluster was offset by 1 from the value set in `config.ini`. This meant that setting `InitialNoOpenFiles` to the same value always caused an error. ([Bug#28749](#))
- Searches on indexed and non-indexed `ENUM` columns could return different results for empty strings. ([Bug#28729](#))
- Executing `EXPLAIN EXTENDED` on a query using a derived table over a grouping subselect could lead to a server crash. This occurred only when materialization of the derived tables required creation of an auxiliary temporary table, an example being when a grouping operation was carried out with usage of a temporary table. ([Bug#28728](#))
- `UPDATE IGNORE` statements involving the primary keys of multiple tables could result in data corruption. ([Bug#28719](#))
- The result of evaluation for a view's `CHECK OPTION` option over an updated record and records of merged tables was arbitrary and dependant on the order of records in the merged tables during the execution of the `SELECT` statement. ([Bug#28716](#))
- The “manager thread” of the LinuxThreads implementation was unintentionally started before `mysqld` had dropped privileges (to run as an unprivileged user). This caused signaling between threads in `mysqld` to fail when the privileges were finally dropped. ([Bug#28690](#))
- For debug builds, `ALTER TABLE` could trigger an assertion failure due to occurrence of a deadlock when committing changes. ([Bug#28652](#))
- After an upgrade, the names of stored routines referenced by views were no longer displayed by `SHOW CREATE VIEW`. ([Bug#28605](#))

This regression was introduced by [Bug#23491](#)

- Killing from one connection a long-running `EXPLAIN QUERY` started from another connection caused `mysqld` to crash. ([Bug#28598](#))
- Outer join queries with `ON` conditions over constant outer tables did not return `NULL`-complemented rows when conditions were evaluated to `FALSE`. ([Bug#28571](#))
- An update on a multiple-table view with the `CHECK OPTION` clause and a subquery in the `WHERE` condition could cause an assertion failure. ([Bug#28561](#))
- `PURGE MASTER LOGS BEFORE (subquery)` caused a server crash. Subqueries are forbidden in the `BEFORE` clause now. ([Bug#28553](#))
- `mysqldump` calculated the required memory for a hex-blob string incorrectly causing a buffer overrun. This in turn caused `mysqldump` to crash silently and produce incomplete output. ([Bug#28522](#))
- Passing a `DECIMAL` value as a parameter of a statement prepared with `PREPARE` resulted in an error. ([Bug#28509](#))
- `mysql_affected_rows()` could return an incorrect result for `INSERT ... ON DUPLICATE KEY UPDATE` if the `CLIENT_FOUND_ROWS` flag was set. ([Bug#28505](#))
- A query that grouped by the result of an expression returned a different result when the expression was assigned to a user variable. ([Bug#28494](#))
- Subselects returning `LONG` values in MySQL versions later than 5.0.24a returned `LONGLONG` prior to this. The previous behavior was restored. ([Bug#28492](#))

This regression was introduced by [Bug#19714](#)

- Forcing the use of an index on a `SELECT` query when the index had been disabled would raise an error without running the query. The query now executes, with a warning generated noting that the use of a disabled index has been ignored. (Bug#28476)
- The result of executing of a prepared statement created with `PREPARE s FROM "SELECT 1 LIMIT ?"` was not replicated correctly. (Bug#28464)
- The query `SELECT '2007-01-01' + INTERVAL column_name DAY FROM table_name` caused `mysqld` to fail. (Bug#28450)
- A server crash could happen under rare conditions such that a temporary table outgrew heap memory reserved for it and the remaining disk space was not big enough to store the table as a `MyISAM` table. (Bug#28449)
- `mysql_upgrade` failed if certain SQL modes were set. Now it sets the mode itself to avoid this problem. (Bug#28401)
- The test case for `mysqldump` failed with `bin-log` disabled. (Bug#28372)
- Attempting to `LOAD_FILE` from an empty floppy drive under Windows, caused the server to hang. For example, if you opened a connection to the server and then issued the command `SELECT LOAD_FILE('a:test');`, with no floppy in the drive, the server was inaccessible until the modal pop-up dialog box was dismissed. (Bug#28366)
- A buffer overflow could occur when using `DECIMAL` columns on Windows operating systems. (Bug#28361)
- `libmysql.dll` could not be dynamically loaded on Windows. (Bug#28358)
- Grouping queries with correlated subqueries in `WHERE` conditions could produce incorrect results. (Bug#28337)
- `mysqltest` used a too-large stack size on PPC/Debian Linux, causing thread-creation failure for tests that use many threads. (Bug#28333)
- `EXPLAIN` for a query on an empty table immediately after its creation could result in a server crash. (Bug#28272)
- The `IS_UPDATABLE` column in the `INFORMATION_SCHEMA.VIEWS` table was not always set correctly. (Bug#28266)
- Comparing a `DATETIME` column value with a user variable yielded incorrect results. (Bug#28261)
- For `CAST()` of a `NULL` value with type `DECIMAL`, the return value was incorrectly initialized, producing a runtime error for binaries built using Visual C++ 2005. (Bug#28250)
- Recreating a view that already exists on the master would cause a replicating slave to terminate replication with a 'different error message on slave and master' error. (Bug#28244)
- Portability problems caused by use of `isinf()` were corrected. (Bug#28240)
- When dumping procedures, `mysqldump --compact` generated output that restored the session variable `SQL_MODE` without first capturing it. When dumping routines, `mysqldump --compact` neither set nor retrieved the value of `SQL_MODE`. (Bug#28223)
- Comparison of the string value of a date showed as unequal to `CURTIME()`. Similar behavior was exhibited for `DATETIME` values. (Bug#28208)
- The `Bytes_received` and `Bytes_sent` status variables could hold only 32-bit values (not 64-bit values) on some platforms. (Bug#28149)
- Storing a large number into a `FLOAT` or `DOUBLE` column with a fixed length could result in incorrect truncation of the number if the column's length was greater than 31. (Bug#28121)
- The `BLACKHOLE` storage engine does not support `INSERT DELAYED` statements, but they were not being rejected. (Bug#27998)
- `DECIMAL` values beginning with nine 9 digits could be incorrectly rounded. (Bug#27984)
- The second execution of a prepared statement from a `UNION` query with `ORDER BY RAND()` caused the server to crash. This problem could also occur when invoking a stored procedure containing such a query. (Bug#27937)
- For attempts to open a non-existent table, the server should report `ER_NO_SUCH_TABLE` but sometimes reported `ER_TABLE_NOT_LOCKED`. (Bug#27907)
- A stored program that uses a variable name containing multibyte characters could fail to execute. (Bug#27876)

- `ON` conditions from `JOIN` expressions were ignored when checking the `CHECK OPTION` clause while updating a multiple-table view that included such a clause. (Bug#27827)
- On some systems, `udf_example.c` returned an incorrect result length. Also on some systems, `mysql-test-run.pl` could not find the shared object built from `udf_example.c`. (Bug#27741)
- `HASH` indexes on `VARCHAR` columns with binary collations did not ignore trailing spaces from strings before comparisons. This could result in duplicate records being successfully inserted into a `MEMORY` table with unique key constraints. A consequence was that internal `MEMORY` tables used for `GROUP BY` calculation contained duplicate rows that resulted in duplicate-key errors when converting those temporary tables to `MyISAM`, and that error was incorrectly reported as a `table is full` error. (Bug#27643)
- An error occurred trying to connect to `mysqld-debug.exe`. (Bug#27597)
- Selecting `MIN()` on an indexed column that contained only `NULL` values caused `NULL` to be returned for other result columns. (Bug#27573)
- If a stored function or trigger was killed, it aborted but no error was thrown, allowing the calling statement to continue without noticing the problem. This could lead to incorrect results. (Bug#27563)
- When `ALTER TABLE` was used to add a new `DATE` column with no explicit default value, `'0000-00-00'` was used as the default even if the SQL mode included the `NO_ZERO_DATE` mode to prohibit that value. A similar problem occurred for `DATETIME` columns. (Bug#27507)
- Using a `TEXT` local variable in a stored routine in an expression such as `SET var = SUBSTRING(var, 3)` produced an incorrect result. (Bug#27415)
- The error message for error number 137 did not report which database/table combination reported the problem. (Bug#27173)
- A large filesort could result in a division by zero error and a server crash. (Bug#27119)
- Binary logging of prepared statements could produce syntactically incorrect queries in the binary log, replacing some parameters with variable names rather than variable values. This could lead to incorrect results on replication slaves. (Bug#26842, Bug#12826)
- Connections from one `mysqld` server to another failed on Mac OS X, affecting replication and `FEDERATED` tables. (Bug#26664)
- Some test suite files were missing from some MySQL-test packages. (Bug#26609)
- Statements within triggers ignored the value of the `low_priority_updates` system variable. (Bug#26162)
- Running `CHECK TABLE` concurrently with a `SELECT`, `INSERT` or other statement on Windows could corrupt a `MyISAM` table. (Bug#25712)
- On Windows, connection handlers did not properly decrement the server's thread count when exiting. (Bug#25621)
- Due to a race condition, executing `FLUSH PRIVILEGES` in one thread could cause brief table unavailability in other threads. (Bug#24988)
- On some Linux distributions where `LinuxThreads` and `NPTL glibc` versions both are available, statically built binaries can crash because the linker defaults to `LinuxThreads` when linking statically, but calls to external libraries (such as `libnss`) are resolved to `NPTL` versions. This cannot be worked around in the code, so instead if a crash occurs on such a binary/OS combination, print an error message that provides advice about how to fix the problem. (Bug#24611)
- Implicit conversion of 9912101 to `DATE` did not match `CAST(9912101 AS DATE)`. (Bug#23093)
- Conversion errors could occur when constructing the condition for an `IN` predicate. The predicate was treated as if the affected column contains `NULL`, but if the `IN` predicate is inside `NOT`, incorrect results could be returned. (Bug#22855)
- When using transactions and replication, shutting down the master in the middle of a transaction would cause all slaves to stop replicating. (Bug#22725)
- Linux binaries were unable to dump core after executing a `setuid()` call. (Bug#21723)
- Stack overflow caused server crashes. (Bug#21476)
- `CURDATE()` is less than `NOW()`, either when comparing `CURDATE()` directly (`CURDATE() < NOW()` is true) or when casting `CURDATE()` to `DATE` (`CAST(CURDATE() AS DATE) < NOW()` is true). However, storing `CURDATE()` in a `DATE` column and comparing `col_name < NOW()` incorrectly yielded false. This is fixed by comparing a `DATE` column as `DATETIME` for comparisons to a `DATETIME` constant. (Bug#21103)

- For dates with 4-digit year parts less than 200, an incorrect implicit conversion to add a century was applied for date arithmetic performed with `DATE_ADD()`, `DATE_SUB()`, `+ INTERVAL`, and `- INTERVAL`. (For example, `DATE_ADD('0050-01-01 00:00:00', INTERVAL 0 SECOND)` became `'2050-01-01 00:00:00'`.) (Bug#18997)
- Using `CREATE TABLE LIKE ...` would raise an assertion when replicated to a slave. (Bug#18950)
- Granting access privileges to an individual table where the database or table name contained an underscore would fail. (Bug#18660)
- The `-lmtmalloc` library was removed from the output of `mysql_config` on Solaris, as it caused problems when building `DBD:mysql` (and possibly other applications) on that platform that tried to use `dlopen()` to access the client library. (Bug#18322)
- The `check-cpu` script failed to detect AMD64 Turion processors correctly. (Bug#17707)
- Trying to shut down the server following a failed `LOAD DATA INFILE` caused `mysqld` to crash. (Bug#17233)
- Using up-arrow for command-line recall in `mysql` could cause a segmentation fault. (Bug#10218)
- The result for `CAST()` when casting a value to `UNSIGNED` was limited to the maximum signed `BIGINT` value, not the maximum unsigned value. (Bug#8663)

C.1.6. Release Notes for MySQL Enterprise 5.0.44 (21 June 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.42).

Functionality added or changed:

- **MySQL Cluster:** The server source tree now includes scripts to simplify building MySQL with SCI support. For more information about SCI interconnects and these build scripts, see [Section 16.9.1, “Configuring MySQL Cluster to use SCI Sockets”](#). (Bug#25470)
- Enterprise builds did not include the `CSV` storage engine. `CSV` is now included in Enterprise builds for all platforms except Windows, QNX, and NetWare. (Bug#28844)
- A new status variable, `Com_call_procedure`, indicates the number of calls to stored procedures. (Bug#27994)

Bugs fixed:

- **Security Fix:** A malformed password packet in the connection protocol could cause the server to crash. Thanks for Dormando for reporting this bug and providing details and a proof of concept. (Bug#28984)
- **Security Fix:** `CREATE TABLE LIKE` did not require any privileges on the source table. Now it requires the `SELECT` privilege.

In addition, `CREATE TABLE LIKE` was not isolated from alteration by other connections, which resulted in various errors and incorrect binary log order when trying to execute concurrently a `CREATE TABLE LIKE` statement and either DDL statements on the source table or DML or DDL statements on the target table. (Bug#23667, Bug#25578, CVE-2007-3781)

- **Incompatible Change:** When `mysqldump` was run with the `--delete-master-logs` option, binary log files were deleted before it was known that the dump had succeeded, not after. (The method for removing log files used `RESET MASTER` prior to the dump. This also reset the binary log sequence numbering to `.000001`.) Now `mysqldump` flushes the logs (which creates a new binary log number with the next sequence number), performs the dump, and then uses `PURGE MASTER LOGS` to remove the log files older than the new one. This also preserves log numbering because the new log with the next number is generated and only the preceding logs are removed. However, this may affect applications if they rely on the log numbering sequence being reset. (Bug#24733)
- **Incompatible Change:** The use of an `ORDER BY` or `DISTINCT` clause with a query containing a call to the `GROUP_CONCAT()` function caused results from previous queries to be redisplayed in the current result. The fix for this includes replacing a `BLOB` value used internally for sorting with a `VARCHAR`. This means that for long results (more than 65,535 bytes), it is possible for truncation to occur; if so, an appropriate warning is issued. (Bug#23856, Bug#28273)
- **MySQL Cluster:** : A corrupt schema file could cause a `FILE ALREADY OPEN` error. (Bug#28770)

- **MySQL Cluster:** A race condition could result when non-master nodes (in addition to the master node) tried to update active status due to a local checkpoint. Now only the master updates the active status. (Bug#28717)
- **MySQL Cluster:** A fast global checkpoint under high load with a high usage of the redo buffer caused data nodes to fail. (Bug#28653)
- **MySQL Cluster:** When an API node sent more than 1024 signals in a single batch, NDB would process only the first 1024 of these, and then hang. (Bug#28443)
- **MySQL Cluster:** A delay in obtaining `AUTO_INCREMENT` IDs could lead to excess temporary errors. (Bug#28410)
- **MySQL Cluster:** A failure to release internal resources following an error could lead to problems with single user mode. (Bug#25818)
- On the IBM i5 platform, the installation script in *SAVF binaries unconditionally executed the `mysql_install_db` script. This problem was fixed in a repackaged distribution numbered 5.0.44b. (Bug#30084)
- Long pathnames for internal temporary tables could cause stack overflows. (Bug#29015)
- Using an `INTEGER` column from a table to `ROUND()` a number produced different results than using a constant with the same value as the `INTEGER` column. (Bug#28980)
- If a program binds a given number of parameters to a prepared statement handle and then somehow changes `stmt->param_count` to a different number, `mysql_stmt_execute()` could crash the client or server. (Bug#28934)
- `INSERT .. ON DUPLICATE KEY UPDATE` could under some circumstances silently update rows when it should not have. (Bug#28904)
- Queries that used `UUID()` were incorrectly allowed into the query cache. (This should not happen because `UUID()` is non-deterministic.) (Bug#28897)
- Using a `VIEW` created with a non-existing `DEFINER` could lead to incorrect results under some circumstances. (Bug#28895)
- For InnoDB tables that use the `utf8` character set, incorrect results could occur for DML statements such as `DELETE` or `UPDATE` that use an index on character-based columns. (Bug#28878)

See also Bug#29449, Bug#30485, Bug#31395

This regression was introduced by Bug#13195

- On Windows, `USE_TLS` was not defined for `mysqlclient.lib`. (Bug#28860)
- A subquery with `ORDER BY` and `LIMIT 1` could cause a server crash. (Bug#28811)
- Using `BETWEEN` with non-indexed date columns and short formats of the date string could return incorrect results. (Bug#28778)
- Selecting `GEOMETRY` columns in a `UNION` caused a server crash. (Bug#28763)
- When constructing the path to the original `.frm` file, `ALTER .. RENAME` was unnecessarily (and incorrectly) lowercasing the entire path when not on a case-insensitive filesystem, causing the statement to fail. (Bug#28754)
- The actual value of `MaxNoOfOpenFiles` as used by the cluster was offset by 1 from the value set in `config.ini`. This meant that setting `InitialNoOpenFiles` to the same value always caused an error. (Bug#28749)
- Searches on indexed and non-indexed `ENUM` columns could return different results for empty strings. (Bug#28729)
- Executing `EXPLAIN EXTENDED` on a query using a derived table over a grouping subselect could lead to a server crash. This occurred only when materialization of the derived tables required creation of an auxiliary temporary table, an example being when a grouping operation was carried out with usage of a temporary table. (Bug#28728)
- `UPDATE IGNORE` statements involving the primary keys of multiple tables could result in data corruption. (Bug#28719)
- The result of evaluation for a view's `CHECK OPTION` option over an updated record and records of merged tables was arbitrary and dependant on the order of records in the merged tables during the execution of the `SELECT` statement. (Bug#28716)
- The “manager thread” of the LinuxThreads implementation was unintentionally started before `mysqld` had dropped privileges (to run as an unprivileged user). This caused signaling between threads in `mysqld` to fail when the privileges were finally dropped. (Bug#28690)
- For debug builds, `ALTER TABLE` could trigger an assertion failure due to occurrence of a deadlock when committing changes.

([Bug#28652](#))

- After an upgrade, the names of stored routines referenced by views were no longer displayed by `SHOW CREATE VIEW`. ([Bug#28605](#))

This regression was introduced by [Bug#23491](#)

- Killing from one connection a long-running `EXPLAIN QUERY` started from another connection caused `mysqld` to crash. ([Bug#28598](#))
- Outer join queries with `ON` conditions over constant outer tables did not return `NULL`-complemented rows when conditions were evaluated to `FALSE`. ([Bug#28571](#))
- An update on a multiple-table view with the `CHECK OPTION` clause and a subquery in the `WHERE` condition could cause an assertion failure. ([Bug#28561](#))
- `PURGE MASTER LOGS BEFORE (subquery)` caused a server crash. Subqueries are forbidden in the `BEFORE` clause now. ([Bug#28553](#))
- `mysqldump` calculated the required memory for a hex-blob string incorrectly causing a buffer overrun. This in turn caused `mysqldump` to crash silently and produce incomplete output. ([Bug#28522](#))
- Passing a `DECIMAL` value as a parameter of a statement prepared with `PREPARE` resulted in an error. ([Bug#28509](#))
- `mysql_affected_rows()` could return an incorrect result for `INSERT ... ON DUPLICATE KEY UPDATE` if the `CLIENT_FOUND_ROWS` flag was set. ([Bug#28505](#))
- A query that grouped by the result of an expression returned a different result when the expression was assigned to a user variable. ([Bug#28494](#))
- Subselects returning `LONG` values in MySQL versions later than 5.0.24a returned `LONGLONG` prior to this. The previous behavior was restored. ([Bug#28492](#))

This regression was introduced by [Bug#19714](#)

- Forcing the use of an index on a `SELECT` query when the index had been disabled would raise an error without running the query. The query now executes, with a warning generated noting that the use of a disabled index has been ignored. ([Bug#28476](#))
- The result of executing of a prepared statement created with `PREPARE s FROM "SELECT 1 LIMIT ?"` was not replicated correctly. ([Bug#28464](#))
- The query `SELECT '2007-01-01' + INTERVAL column_name DAY FROM table_name` caused `mysqld` to fail. ([Bug#28450](#))
- A server crash could happen under rare conditions such that a temporary table outgrew heap memory reserved for it and the remaining disk space was not big enough to store the table as a `MyISAM` table. ([Bug#28449](#))
- `mysql_upgrade` failed if certain SQL modes were set. Now it sets the mode itself to avoid this problem. ([Bug#28401](#))
- The test case for `mysqldump` failed with `bin-log` disabled. ([Bug#28372](#))
- Attempting to `LOAD_FILE` from an empty floppy drive under Windows, caused the server to hang. For example, if you opened a connection to the server and then issued the command `SELECT LOAD_FILE('a:test');`, with no floppy in the drive, the server was inaccessible until the modal pop-up dialog box was dismissed. ([Bug#28366](#))
- A buffer overflow could occur when using `DECIMAL` columns on Windows operating systems. ([Bug#28361](#))
- `libmysql.dll` could not be dynamically loaded on Windows. ([Bug#28358](#))
- Grouping queries with correlated subqueries in `WHERE` conditions could produce incorrect results. ([Bug#28337](#))
- `mysqltest` used a too-large stack size on PPC/Debian Linux, causing thread-creation failure for tests that use many threads. ([Bug#28333](#))
- `EXPLAIN` for a query on an empty table immediately after its creation could result in a server crash. ([Bug#28272](#))
- The `IS_UPDATABLE` column in the `INFORMATION_SCHEMA.VIEWS` table was not always set correctly. ([Bug#28266](#))
- Comparing a `DATETIME` column value with a user variable yielded incorrect results. ([Bug#28261](#))

- For `CAST()` of a `NULL` value with type `DECIMAL`, the return value was incorrectly initialized, producing a runtime error for binaries built using Visual C++ 2005. (Bug#28250)
- Recreating a view that already exists on the master would cause a replicating slave to terminate replication with a 'different error message on slave and master' error. (Bug#28244)
- Portability problems caused by use of `isinf()` were corrected. (Bug#28240)
- When dumping procedures, `mysqldump --compact` generated output that restored the session variable `SQL_MODE` without first capturing it. When dumping routines, `mysqldump --compact` neither set nor retrieved the value of `SQL_MODE`. (Bug#28223)
- Comparison of the string value of a date showed as unequal to `CURTIME()`. Similar behavior was exhibited for `DATETIME` values. (Bug#28208)
- The `Bytes_received` and `Bytes_sent` status variables could hold only 32-bit values (not 64-bit values) on some platforms. (Bug#28149)
- Storing a large number into a `FLOAT` or `DOUBLE` column with a fixed length could result in incorrect truncation of the number if the column's length was greater than 31. (Bug#28121)
- The `BLACKHOLE` storage engine does not support `INSERT DELAYED` statements, but they were not being rejected. (Bug#27998)
- `DECIMAL` values beginning with nine 9 digits could be incorrectly rounded. (Bug#27984)
- The second execution of a prepared statement from a `UNION` query with `ORDER BY RAND()` caused the server to crash. This problem could also occur when invoking a stored procedure containing such a query. (Bug#27937)
- For attempts to open a non-existent table, the server should report `ER_NO_SUCH_TABLE` but sometimes reported `ER_TABLE_NOT_LOCKED`. (Bug#27907)
- A stored program that uses a variable name containing multibyte characters could fail to execute. (Bug#27876)
- `ON` conditions from `JOIN` expressions were ignored when checking the `CHECK OPTION` clause while updating a multiple-table view that included such a clause. (Bug#27827)
- On some systems, `udf_example.c` returned an incorrect result length. Also on some systems, `mysql-test-run.pl` could not find the shared object built from `udf_example.c`. (Bug#27741)
- `HASH` indexes on `VARCHAR` columns with binary collations did not ignore trailing spaces from strings before comparisons. This could result in duplicate records being successfully inserted into a `MEMORY` table with unique key constraints. A consequence was that internal `MEMORY` tables used for `GROUP BY` calculation contained duplicate rows that resulted in duplicate-key errors when converting those temporary tables to `MyISAM`, and that error was incorrectly reported as a `table is full` error. (Bug#27643)
- An error occurred trying to connect to `mysqld-debug.exe`. (Bug#27597)
- Selecting `MIN()` on an indexed column that contained only `NULL` values caused `NULL` to be returned for other result columns. (Bug#27573)
- If a stored function or trigger was killed, it aborted but no error was thrown, allowing the calling statement to continue without noticing the problem. This could lead to incorrect results. (Bug#27563)
- When `ALTER TABLE` was used to add a new `DATE` column with no explicit default value, `'0000-00-00'` was used as the default even if the SQL mode included the `NO_ZERO_DATE` mode to prohibit that value. A similar problem occurred for `DATETIME` columns. (Bug#27507)
- Using a `TEXT` local variable in a stored routine in an expression such as `SET var = SUBSTRING(var, 3)` produced an incorrect result. (Bug#27415)
- The error message for error number 137 did not report which database/table combination reported the problem. (Bug#27173)
- A large filesort could result in a division by zero error and a server crash. (Bug#27119)
- Binary logging of prepared statements could produce syntactically incorrect queries in the binary log, replacing some parameters with variable names rather than variable values. This could lead to incorrect results on replication slaves. (Bug#26842, Bug#12826)
- Connections from one `mysqld` server to another failed on Mac OS X, affecting replication and `FEDERATED` tables. (Bug#26664)

- Some test suite files were missing from some MySQL-test packages. (Bug#26609)
- Statements within triggers ignored the value of the `low_priority_updates` system variable. (Bug#26162)
- Running `CHECK TABLE` concurrently with a `SELECT`, `INSERT` or other statement on Windows could corrupt a MyISAM table. (Bug#25712)
- On Windows, connection handlers did not properly decrement the server's thread count when exiting. (Bug#25621)
- Due to a race condition, executing `FLUSH PRIVILEGES` in one thread could cause brief table unavailability in other threads. (Bug#24988)
- On some Linux distributions where LinuxThreads and NPTL `glibc` versions both are available, statically built binaries can crash because the linker defaults to LinuxThreads when linking statically, but calls to external libraries (such as `libnss`) are resolved to NPTL versions. This cannot be worked around in the code, so instead if a crash occurs on such a binary/OS combination, print an error message that provides advice about how to fix the problem. (Bug#24611)
- Implicit conversion of `9912101` to `DATE` did not match `CAST(9912101 AS DATE)`. (Bug#23093)
- Conversion errors could occur when constructing the condition for an `IN` predicate. The predicate was treated as if the affected column contains `NULL`, but if the `IN` predicate is inside `NOT`, incorrect results could be returned. (Bug#22855)
- When using transactions and replication, shutting down the master in the middle of a transaction would cause all slaves to stop replicating. (Bug#22725)
- Linux binaries were unable to dump core after executing a `setuid()` call. (Bug#21723)
- Stack overflow caused server crashes. (Bug#21476)
- `CURDATE()` is less than `NOW()`, either when comparing `CURDATE()` directly (`CURDATE() < NOW()` is true) or when casting `CURDATE()` to `DATE(CAST(CURDATE() AS DATE) < NOW())` is true). However, storing `CURDATE()` in a `DATE` column and comparing `col_name < NOW()` incorrectly yielded false. This is fixed by comparing a `DATE` column as `DATETIME` for comparisons to a `DATETIME` constant. (Bug#21103)
- For dates with 4-digit year parts less than 200, an incorrect implicit conversion to add a century was applied for date arithmetic performed with `DATE_ADD()`, `DATE_SUB()`, `+ INTERVAL`, and `- INTERVAL`. (For example, `DATE_ADD('0050-01-01 00:00:00', INTERVAL 0 SECOND)` became `'2050-01-01 00:00:00'`.) (Bug#18997)
- Using `CREATE TABLE LIKE ...` would raise an assertion when replicated to a slave. (Bug#18950)
- Granting access privileges to an individual table where the database or table name contained an underscore would fail. (Bug#18660)
- The `-lmtmalloc` library was removed from the output of `mysql_config` on Solaris, as it caused problems when building `DBD:mysql` (and possibly other applications) on that platform that tried to use `dlopen()` to access the client library. (Bug#18322)
- The `check-cpu` script failed to detect AMD64 Turion processors correctly. (Bug#17707)
- Trying to shut down the server following a failed `LOAD DATA INFILE` caused `mysqld` to crash. (Bug#17233)
- Using up-arrow for command-line recall in `mysql` could cause a segmentation fault. (Bug#10218)
- The result for `CAST()` when casting a value to `UNSIGNED` was limited to the maximum signed `BIGINT` value, not the maximum unsigned value. (Bug#8663)

C.1.7. Release Notes for MySQL Enterprise 5.0.42 (23 May 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.40).

Functionality added or changed:

- Prior to this release, when `DATE` values were compared with `DATETIME` values the time portion of the `DATETIME` value was ignored. Now a `DATE` value is coerced to the `DATETIME` type by adding the time portion as "00:00:00". To mimic the old behavior use the `CAST()` function in the following way: `SELECT date_field = CAST(NOW() as DATE);` (Bug#28929)

- `mysqld_multi` now understands the `--no-defaults`, `--defaults-file`, and `--defaults-extra-file` options. The `--config-file` option is deprecated; if given, it is treated like `--defaults-extra-file`. (Bug#27390)

Bugs fixed:

- **Security Fix:** Use of a view could allow a user to gain update privileges for tables in other databases. (Bug#27878, CVE-2007-3782)
- **Security Fix:** The requirement of the `DROP` privilege for `RENAME TABLE` was not being enforced. (Bug#27515, CVE-2007-2691)
- **Security Fix:** If a stored routine was declared using `SQL SECURITY INVOKER`, a user who invoked the routine could gain privileges. (Bug#27337, CVE-2007-2692)
- **MySQL Cluster:** `INSERT IGNORE` wrongly ignored `NULL` values in unique indexes. (Bug#27980)
- **MySQL Cluster:** The name of the month “March” was given incorrectly in the cluster error log. (Bug#27926)
- **MySQL Cluster:** It was not possible to add a unique index to an `NDB` table while in single user mode. (Bug#27710)
- **MySQL Cluster:** Repeated insertion of data generated by `mysqldump` into `NDB` tables could eventually lead to failure of the cluster. (Bug#27437)
- **MySQL Cluster:** (APIs): For `BLOB` reads on operations with lock mode `LM_CommittedRead`, the lock mode was not upgraded to `LM_Read` before the state of the `BLOB` had already been calculated. The `NDB` API methods affected by this problem included the following:
 - `NdbOperation::readTuple()`
 - `NdbScanOperation::readTuples()`
 - `NdbIndexScanOperation::readTuples()` (Bug#27320)
- **MySQL Cluster:** `ndb_connectstring` did not appear in the output of `SHOW VARIABLES`. (Bug#26675)
- On the IBM i5 platform, the installation script in *SAVF binaries unconditionally executed the `mysql_install_db` script. This problem was fixed in a repackaged distribution numbered 5.0.42b. (Bug#30084)
- A query with a `NOT IN` subquery predicate could cause a crash when the left operand of the predicate evaluated to `NULL`. (Bug#28375)
- For `InnoDB`, in some rare cases the optimizer preferred a more expensive `ref` access to a less expensive range access. (Bug#28189)
- A performance degradation was observed for outer join queries to which a not-exists optimization was applied. (Bug#28188)
- `SELECT * INTO OUTFILE ... FROM INFORMATION_SCHEMA.schemata` failed with an `Access denied` error, even for a user who has the `FILE` privilege. (Bug#28181)
- Comparisons of `DATE` or `DATETIME` values for the `IN()` function could yield incorrect results. (Bug#28133)
- The cluster waited 30 seconds instead of 30 milliseconds before reading table statistics. (Bug#28093)
- The server could hang for `INSERT IGNORE ... ON DUPLICATE KEY UPDATE` if an update failed. (Bug#28000)
- `CAST()` to `DECIMAL` did not check for overflow. (Bug#27957)
- For `INSERT ... ON DUPLICATE KEY UPDATE` statements that affected many rows, updates could be applied to the wrong rows. (Bug#27954)
- Early `NULL`-filtering optimization did not work for `eq_ref` table access. (Bug#27939)
- Views ignored precision for `CAST()` operations. (Bug#27921)
- Non-grouped columns were allowed by `*` in `ONLY_FULL_GROUP_BY` SQL mode. (Bug#27874)
- Debug builds on Windows generated false alarms about uninitialized variables with some Visual Studio runtime libraries. (Bug#27811)

- Certain queries that used uncorrelated scalar subqueries caused `EXPLAIN` to crash. (Bug#27807)
- Changes to some system variables should invalidate statements in the query cache, but invalidation did not happen. (Bug#27792)
- Performing a `UNION` on two views that had had `ORDER BY` clauses resulted in an `Unknown column` error. (Bug#27786)
- `mysql_install_db` is supposed to detect existing system tables and create only those that do not exist. Instead, it was exiting with an error if tables already existed. (Bug#27783)
- `mysqld` did not check the length of option values and could crash with a buffer overflow for long values. (Bug#27715)
- Comparisons using row constructors could fail for rows containing `NULL` values. (Bug#27704)
- `LOAD DATA` did not use `CURRENT_TIMESTAMP` as the default value for a `TIMESTAMP` column for which no value was provided. (Bug#27670)
- `mysqldump` could not connect using SSL. (Bug#27669)
- On Linux, the server could not create temporary tables if `lower_case_table_names` was set to 1 and the value of `tmp-dir` was a directory name containing any uppercase letters. (Bug#27653)
- For InnoDB tables, a multiple-row `INSERT` of the form `INSERT INTO t (id...) VALUES (NULL...) ON DUPLICATE KEY UPDATE id=VALUES(id)`, where `id` is an `AUTO_INCREMENT` column, could cause `ERROR 1062 (23000): Duplicate entry...` errors or lost rows. (Bug#27650)
- The XML output representing an empty result was an empty string rather than an empty `<resultset/>` element. (Bug#27608)
- Comparison of a `DATE` with a `DATETIME` did not treat the `DATE` as having a time part of `00:00:00`. (Bug#27590)
- The fix for Bug#17212 provided correct sort order for misordered output of certain queries, but caused significant overall query performance degradation. (Results were correct (good), but returned much more slowly (bad).) The fix also affected performance of queries for which results were correct. The performance degradation has been addressed. (Bug#27531)
- The `CRC32()` function returns an unsigned integer, but the metadata was signed, which could cause certain queries to return incorrect results. (For example, queries that selected a `CRC32()` value and used that value in the `GROUP BY` clause.) (Bug#27530)
- An interaction between `SHOW TABLE STATUS` and other concurrent statements that modify the table could result in a divide-by-zero error and a server crash. (Bug#27516)
- A race condition between `DROP TABLE` and `SHOW TABLE STATUS` could cause the latter to display incorrect information. (Bug#27499)
- Nested aggregate functions could be improperly evaluated. (Bug#27363)
- A stored function invocation in the `WHERE` clause was treated as a constant. (Bug#27354)
- Failure to allocate memory associated with `transaction_prealloc_size` could cause a server crash. (Bug#27322)
- `mysqldump` crashed if it got no data from `SHOW CREATE PROCEDURE` (for example, when trying to dump a routine defined by a different user and for which the current user had no privileges). Now it prints a comment to indicate the problem. It also returns an error, or continues if the `--force` option is given. (Bug#27293)
- `mysqlbinlog` produced different output with the `-R` option than without it. (Bug#27171)
- Flow control optimization in stored routines could cause exception handlers to never return or execute incorrect logic. (Bug#26977)
- `mysqldump` would not dump a view for which the `DEFINER` no longer exists. (Bug#26817)
- Creating a temporary table with InnoDB when using the one-file-per-table setting, when the host filesystem for temporary tables is `tmpfs` would cause an assertion within `mysqld`. This was due to the use of `O_DIRECT` when opening the temporary table file. (Bug#26662)
- `mysql_upgrade` did not detect failure of external commands that it runs. (Bug#26639)
- Aborting a statement on the master that applied to a non-transactional statement broke replication. The statement was written to the binary log but not completely executed on the master. Slaves receiving the statement executed it completely, resulting in loss of data synchrony. Now an error code is written to the error log so that the slaves stop without executing the aborted state-

- ment. (That is, replication stops, but synchrony to the point of the stop is preserved and you can investigate the problem.) (Bug#26551)
- Index hints (`USE INDEX`, `IGNORE INDEX`, `FORCE INDEX`) cannot be used with `FULLTEXT` indexes, but were not being ignored. (Bug#25951)
 - If `CREATE TABLE t1 LIKE t2` failed due to a full disk, an empty `t2.frm` file could be created but not removed. This file then caused subsequent attempts to create a table named `t2` to fail. This is easily corrected at the filesystem level by removing the `t2.frm` file manually, but now the server removes the file if the create operation does not complete successfully. (Bug#25761)
 - `mysql_upgrade` did not pass a password to `mysqlcheck` if one was given. (Bug#25452)
 - On Windows, `mysql_upgrade` was sensitive to lettercase of the names of some required components. (Bug#25405)
 - For storage engines that allow the current auto-increment value to be set, using `ALTER TABLE ... ENGINE` to convert a table from one such storage engine to another caused loss of the current value. (For storage engines that do not support setting the value, it cannot be retained anyway when changing the storage engine.) (Bug#25262)
 - Restoration of the default database after stored routine or trigger execution on a slave could cause replication to stop if the database no longer existed. (Bug#25082)
 - Several math functions produced incorrect results for large unsigned values. `ROUND()` produced incorrect results or a crash for a large number-of-decimals argument. (Bug#24912)
 - The result set of a query that used `WITH ROLLUP` and `DISTINCT` could lack some rollup rows (rows with `NULL` values for grouping attributes) if the `GROUP BY` list contained constant expressions. (Bug#24856)
 - For queries that used `ORDER BY` with `InnoDB` tables, if the optimizer chose an index for accessing the table but found a covering index that enabled the `ORDER BY` to be skipped, no results were returned. (Bug#24778)
 - Concurrent execution of `CREATE TABLE ... SELECT` and other statements involving the target table suffered from various race conditions, some of which might have led to deadlocks. (Bug#24738)
 - An attempt to execute `CREATE TABLE ... SELECT` when a temporary table with the same name already existed led to the insertion of data into the temporary table and creation of an empty non-temporary table. (Bug#24508)
 - The `MERGE` storage engine could return incorrect results when several index values that compare equality were present in an index (for example, `'gross'` and `'gross '`, which are considered equal but have different lengths). (Bug#24342)
 - Some upgrade problems are detected and better error messages suggesting that `mysql_upgrade` be run are produced. (Bug#24248)
 - Some views could not be created even when the user had the requisite privileges. (Bug#24040)
 - Using `CAST()` to convert `DATETIME` values to numeric values did not work. (Bug#23656)
 - The `AUTO_INCREMENT` value would not be correctly reported for `InnoDB` tables when using `SHOW CREATE TABLE` statement or `mysqldump` command. (Bug#23313)
 - `SELECT COUNT(*)` from a table containing a `DATETIME NOT NULL` column could produce spurious warnings with the `NO_ZERO_DATE` SQL mode enabled. (Bug#22824)
 - Using `SET GLOBAL` to change the `lc_time_names` system variable had no effect on new connections. (Bug#22648)
 - A multiple-table `UPDATE` could return an incorrect rows-matched value if, during insertion of rows into a temporary table, the table had to be converted from a `MEMORY` table to a `MyISAM` table. (Bug#22364)
 - `yaSSL` crashed on pre-Pentium Intel CPUs. (Bug#21765)
 - A slave that used `--master-ssl-cipher` could not connect to the master. (Bug#21611)
 - Quoted labels in stored routines were mishandled, rendering the routines unusable. (Bug#21513)
 - The server could abort or deadlock for `INSERT DELAYED` statements for which another insert was performed implicitly (for example, via a stored function that inserted a row). (Bug#21483)
 - `CREATE TABLE IF NOT EXISTS ... SELECT` caused a server crash if the target table already existed and had a `BEFORE INSERT` trigger. (Bug#20903)
 - Deadlock occurred for attempts to execute `CREATE TABLE IF NOT EXISTS ... SELECT` when `LOCK TABLES` had

- been used to acquire a read lock on the target table. (Bug#20662, Bug#15522)
- Changing a `utf8` column in an `InnoDB` table to a shorter length did not shorten the data values. (Bug#20095)
- The omission of leading zeros in dates could lead to erroneous results when these were compared with the output of certain date and time functions. (Bug#16377)
- `INSERT...ON DUPLICATE KEY UPDATE` could cause `Error 1032: Can't find record in ...` for inserts into an `InnoDB` table unique index using key column prefixes with an underlying `utf8` string column. (Bug#13191)
- Having the `EXECUTE` privilege for a routine in a database should make it possible to `USE` that database, but the server returned an error instead. This has been corrected. As a result of the change, `SHOW TABLES` for a database in which you have only the `EXECUTE` privilege returns an empty set rather than an error. (Bug#9504)

C.1.8. Release Notes for MySQL Enterprise 5.0.40 (17 April 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.38).

Functionality added or changed:

- **MySQL Cluster:** Several options have been added for use with `ndb_restore --print_data` to facilitate the creation of data dump files. (Bug#26900)
- If a set function `S` with an outer reference `S(outer_ref)` cannot be aggregated in the outer query against which the outer reference has been resolved, MySQL interprets `S(outer_ref)` the same way that it would interpret `S(const)`. However, standard SQL requires throwing an error in this situation. An error now is thrown for such queries if the `ANSI SQL` mode is enabled. (Bug#27348)
- Added the `--service-startup-timeout` option for `mysql.server` to specify how long to wait for the server to start. If the server does not start within the timeout period, `mysql.server` exits with an error. (Bug#26952)
- It is now possible to restore selected databases or tables using `ndb_restore`. (Bug#26899)
- Prefix lengths for columns in `SPATIAL` indexes are no longer displayed in `SHOW CREATE TABLE` output. `mysqldump` uses that statement, so if a table with `SPATIAL` indexes containing prefixed columns is dumped and reloaded, the index is created with no prefixes. (The full column width of each column is indexed.) (Bug#26794)
- The output of `mysql --xml` and `mysqldump --xml` now includes a valid XML namespace. (Bug#25946)
- If you use SSL for a client connection, you can tell the client not to authenticate the server certificate by specifying neither `--ssl-ca` nor `--ssl-capath`. The server still verifies the client according to any applicable requirements established via `GRANT` statements for the client, and it still uses any `--ssl-ca/--ssl-capath` values that were passed to server at startup time. (Bug#25309)
- The syntax for index hints has been extended to enable explicit specification that the hint applies only to join processing. See [Section 12.2.7.2, “Index Hint Syntax”](#). (Bug#21174)
- Binary distributions for some platforms did not include shared libraries; now shared libraries are shipped for all platforms except AIX 5.2 64-bit. (Bug#16520, Bug#26767, Bug#13450)
- The `mysql_create_system_tables` script was removed because `mysql_install_db` no longer uses it in MySQL 5.0.

Bugs fixed:

- **Important Note:** The parser accepted invalid code in SQL condition handlers, leading to server crashes or unexpected execution behavior in stored programs. Specifically, the parser allowed a condition handler to refer to labels for blocks that enclose the handler declaration. This was incorrect because block label scope does not include the code for handlers declared within the labeled block.

The parser now rejects this invalid construct, but if you upgrade in place (without dumping and reloading your databases), existing handlers that contain the construct still are invalid *even if they appear to function as you expect* and should be rewritten.

To find affected handlers, use `mysqldump` to dump all stored functions and procedures, triggers, and events. Then attempt to reload them into an upgraded server. Handlers that contain illegal label references will be rejected.

For more information about condition handlers and writing them to avoid invalid jumps, see [Section 18.2.8.2, “DECLARE Handlers”](#). (Bug#26503)

- **MySQL Cluster:** NDB tables having `MEDIUMINT AUTO_INCREMENT` columns were not restored correctly by `ndb_restore`, causing spurious duplicate key errors. This issue did not affect `TINYINT`, `INT`, or `BIGINT` columns with `AUTO_INCREMENT`. (Bug#27775)
- **MySQL Cluster:** NDB tables with indexes whose names contained space characters were not restored correctly by `ndb_restore` (the index names were truncated). (Bug#27758)
- **MySQL Cluster:** Some queries that updated multiple tables were not backed up correctly. (Bug#27748)
- **MySQL Cluster:** Memory usage of a `mysqld` process grew even while idle. (Bug#27560)
- **MySQL Cluster:** It was not possible to set `LockPagesInMainMemory` equal to 0. (Bug#27291)
- **MySQL Cluster:** Error messages displayed when running in single user mode were inconsistent. (Bug#27021)
- **MySQL Cluster:** (APIs): Using `NdbBlob::writeData()` to write data in the middle of an existing blob value (that is, updating the value) could overwrite some data past the end of the data to be changed. (Bug#27018)
- **MySQL Cluster:** The failure of a data node while restarting could cause other data nodes to hang or crash. (Bug#27003)
- **MySQL Cluster:** On Solaris, the value of an NDB table column declared as `BIT(33)` was always displayed as 0. (Bug#26986)
- **MySQL Cluster:** The output from `ndb_restore --print_data` was incorrect for a backup made of a database containing tables with `TINYINT` or `SMALLINT` columns. (Bug#26740)
- **MySQL Cluster:** In some cases, `AFTER UPDATE` and `AFTER DELETE` triggers on NDB tables that referenced subject table did not see the results of operation which caused invocation of the trigger, but rather saw the row as it was prior to the update or delete operation.

This was most noticeable when an update operation used a subquery to obtain the rows to be updated. An example would be `UPDATE tbl1 SET col2 = val1 WHERE tbl1.col1 IN (SELECT col3 FROM tbl2 WHERE c4 = val2)` where there was an `AFTER UPDATE` trigger on table `tbl1`. In such cases, the trigger would fail to execute.

The problem occurred because the actual update or delete operations were deferred to be able to perform them later as one batch. The fix for this bug solves the problem by disabling this optimization for a given update or delete if the table has an `AFTER` trigger defined for this operation. (Bug#26242)

- **MySQL Cluster:** Condition pushdown did not work with prepared statements. (Bug#26225)
- **MySQL Cluster:** Joins on multiple tables containing `BLOB` columns could cause data nodes run out of memory, and to crash with the error `NDBOBJECTIDMAP::EXPAND UNABLE TO EXPAND`. (Bug#26176)
- **MySQL Cluster:** After entering single user mode it was not possible to alter non-NDB tables on any SQL nodes other than the one having sole access to the cluster. (Bug#25275)
- **MySQL Cluster:** When a cluster node suffered a “hard” failure (such as a power failure or loss of a network connection) TCP sockets to the “vanished” node were maintained indefinitely. Now socket-based transporters check for a response and terminate the socket if there is no activity on the socket after 2 hours. (Bug#24793)
- **MySQL Cluster:** The management client command `node_id STATUS` displayed the message `Node node_id: not connected` when `node_id` was not the node ID of a data node.

Note

The `ALL STATUS` command in the cluster management client still displays status information for data nodes only. This is by design. See [Section 16.6.2, “Commands in the MySQL Cluster Management Client”](#), for more information.

(Bug#21715)

- **MySQL Cluster:** Some values of `MaxNoOfTables` caused the error `JOB BUFFER CONGESTION` to occur. (Bug#19378)
- Some equi-joins containing a `WHERE` clause that included a `NOT IN` subquery caused a server crash. (Bug#27870)
- `SELECT DISTINCT` could return incorrect results if the select list contained duplicated columns. (Bug#27659)
- With `NO_AUTO_VALUE_ON_ZERO` SQL mode enabled, `LOAD DATA` operations could assign incorrect `AUTO_INCREMENT`

values. (Bug#27586)

- Under certain rare circumstances, `DROP TABLE` or `TRUNCATE` of an `NDB` table could cause a node failure or forced cluster shutdown. (Bug#27581)
- Incorrect results could be returned for some queries that contained a select list expression with `IN` or `BETWEEN` together with an `ORDER BY` or `GROUP BY` on the same expression using `NOT IN` or `NOT BETWEEN`. (Bug#27532)
- Evaluation of an `IN ()` predicate containing a decimal-valued argument caused a server crash. (Bug#27513, Bug#27362, CVE-2007-2583)
- In out-of-memory conditions, the server might crash or otherwise not report an error to the Windows event log. (Bug#27490)
- Passing nested row expressions with different structures to an `IN` predicate caused a server crash. (Bug#27484)
- The `decimal.h` header file was incorrectly omitted from binary distributions. (Bug#27456)
- With `innodb_file_per_table` enabled, attempting to rename an `InnoDB` table to a non-existent database caused the server to exit. (Bug#27381)
- A subquery could get incorrect values for references to outer query columns when it contained aggregate functions that were aggregated in outer context. (Bug#27321)
- The server did not shut down cleanly. (Bug#27310)
- In a view, a column that was defined using a `GEOMETRY` function was treated as having the `LONGBLOB` data type rather than the `GEOMETRY` type. (Bug#27300)
- A race condition could sometimes occur if the node acting as master failed while node IDs were still being allocated during startup. (Bug#27286)
- When a data node was taking over as the master node, a race condition could sometimes occur as the node was assuming responsibility for handling of global checkpoints. (Bug#27283)
- Queries containing subqueries with `COUNT(*)` aggregated in an outer context returned incorrect results. This happened only if the subquery did not contain any references to outer columns. (Bug#27257)
- Use of an aggregate function from an outer context as an argument to `GROUP_CONCAT ()` caused a server crash. (Bug#27229)
- String truncation upon insertion into an integer or year column did not generate a warning (or an error in strict mode). (Bug#27176, Bug#26359)
- Storing `NULL` values in spatial fields caused excessive memory allocation and crashes on some systems. (Bug#27164)
- Row equalities in `WHERE` clauses could cause memory corruption. (Bug#27154)
- `GROUP BY` on a `ucs2` column caused a server crash when there was at least one empty string in the column. (Bug#27079)
- Duplicate members in `SET` definitions were not detected. Now they result in a warning; if strict SQL mode is enabled, an error occurs instead. (Bug#27069)
- For `INSERT ... ON DUPLICATE KEY UPDATE` statements on tables containing `AUTO_INCREMENT` columns, `LAST_INSERT_ID ()` was reset to 0 if no rows were successfully inserted or changed. “Not changed” includes the case where a row was updated to its current values, but in that case, `LAST_INSERT_ID ()` should not be reset to 0. Now `LAST_INSERT_ID ()` is reset to 0 only if no rows were successfully inserted or touched, whether or not touched rows were changed. (Bug#27033)

This regression was introduced by Bug#19978

- `mysql_install_db` could terminate with an error after failing to determine that a system table already existed. (Bug#27022)
- In a `MEMORY` table, using a `BTREE` index to scan for updatable rows could lead to an infinite loop. (Bug#26996)
- Invalid optimization of pushdown conditions for queries where an outer join was guaranteed to read only one row from the outer table led to results with too few rows. (Bug#26963)
- Windows binaries contained no debug symbol file. Now `.map` and `.pdb` files are included in 32-bit builds for `mysqld-nt.exe`, `mysqld-debug.exe`, and `mysqlmanager.exe`. (Bug#26893)
- Out-of-memory errors for slave I/O threads were not reported. Now they are written to the error log. (Bug#26844)

- Improved out-of-memory detection when sending logs from a master server to slaves, and log a message when allocation fails. (Bug#26837)
- For InnoDB tables having a clustered index that began with a CHAR or VARCHAR column, deleting a record and then inserting another before the deleted record was purged could result in table corruption. (Bug#26835)
- mysqld processes would sometimes crash under high load. (Bug#26825)
- Duplicates were not properly identified among (potentially) long strings used as arguments for GROUP_CONCAT(DISTINCT). (Bug#26815)
- ALTER VIEW requires the CREATE VIEW and DROP privileges for the view. However, if the view was created by another user, the server erroneously required the SUPER privilege. (Bug#26813)
- A result set column formed by concatenation of string literals was incomplete when the column was produced by a subquery in the FROM clause. (Bug#26738)
- When using the result of SEC_TO_TIME() for time value greater than 24 hours in an ORDER BY clause, either directly or through a column alias, the rows were sorted incorrectly as strings. (Bug#26672)
- The range optimizer could cause the server to run out of memory. (Bug#26625)
- The range optimizer could consume a combinatorial amount of memory for certain classes of WHERE clauses. (Bug#26624)
- mysqldump could crash or exhibit incorrect behavior when some options were given very long values, such as `--fields-terminated-by="some very long string"`. The code has been cleaned up to remove a number of fixed-sized buffers and to be more careful about error conditions in memory allocation. (Bug#26346)
- If the server was started with `--skip-grant-tables`, Selecting from INFORMATION_SCHEMA tables causes a server crash. (Bug#26285)
- For an INSERT statement that should fail due to a column with no default value not being assigned a value, the statement succeeded with no error if the column was assigned a value in an ON DUPLICATE KEY UPDATE clause, even if that clause was not used. (Bug#26261)
- The temporary file-creation code was cleaned up on Windows to improve server stability. (Bug#26233)
- For MyISAM tables, COUNT(*) could return an incorrect value if the WHERE clause compared an indexed TEXT column to the empty string (' '). This happened if the column contained empty strings and also strings starting with control characters such as tab or newline. (Bug#26231)
- For INSERT INTO ... SELECT where index searches used column prefixes, insert errors could occur when key value type conversion was done. (Bug#26207)
- For DELETE FROM tbl_name ORDER BY col_name (with no WHERE or LIMIT clause), the server did not check whether col_name was a valid column in the table. (Bug#26186)
- REPAIR TABLE ... USE_FRM with an ARCHIVE table deleted all records from the table. (Bug#26138)
- mysqldump crashed for MERGE tables if the `--complete-insert (-c)` option was given. (Bug#25993)
- Setting a column to NOT NULL with an ON DELETE SET NULL clause foreign key crashes the server. (Bug#25927)
- On Windows, debug builds of mysqld could fail with heap assertions. (Bug#25765)
- In certain situations, MATCH ... AGAINST returned false hits for NULL values produced by LEFT JOIN when no full-text index was available. (Bug#25729)
- When RAND() was called multiple times inside a stored procedure, the server did not write the correct random seed values to the binary log, resulting in incorrect replication. (Bug#25543)
- OPTIMIZE TABLE might fail on Windows when it attempts to rename a temporary file to the original name if the original file had been opened, resulting in loss of the .MYD file. (Bug#25521)
- For SHOW ENGINE INNODB STATUS, the LATEST DEADLOCK INFORMATION was not always cleared properly. (Bug#25494)
- mysql_stmt_fetch() did an invalid memory deallocation when used with the embedded server. (Bug#25492)
- GRANT statements were not replicated if the server was started with the `--replicate-ignore-table` or `--replicate-wild-ignore-table` option. (Bug#25482)

- Difficult repair or optimization operations could cause an assertion failure, resulting in a server crash. (Bug#25289)
- Duplicate entries were not assessed correctly in a `MEMORY` table with a `BTREE` primary key on a `utf8 ENUM` column. (Bug#24985)
- Selecting the result of `AVG()` within a `UNION` could produce incorrect values. (Bug#24791)
- `MBROverlaps()` returned incorrect values in some cases. (Bug#24563)
- Increasing the width of a `DECIMAL` column could cause column values to be changed. (Bug#24558)
- A problem in handling of aggregate functions in subqueries caused predicates containing aggregate functions to be ignored during query execution. (Bug#24484)
- The test for the `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` option for `mysql_options()` was performed incorrectly. Also changed as a result of this bugfix: The `arg` option for the `mysql_options()` C API function was changed from `char *` to `void *`. (Bug#24121)
- Replication between master and slave would infinitely retry binary log transmission where the `max_allowed_packet` on the master was larger than that on the slave if the size of the transfer was between these two values. (Bug#23775)
- On Windows, debug builds of `mysqlbinlog` could fail with a memory error. (Bug#23736)
- The values displayed for the `InnoDB_row_lock_time`, `InnoDB_row_lock_time_avg`, and `InnoDB_row_lock_time_max` status variables were incorrect. (Bug#23666)
- `SHOW CREATE VIEW` qualified references to stored functions in the view definition with the function's database name, even when the database was the default database. This affected `mysqldump` (which uses `SHOW CREATE VIEW` to dump views) because the resulting dump file could not be used to reload the database into a different database. `SHOW CREATE VIEW` now suppresses the database name for references to functions in the default database. (Bug#23491)
- An `INTO OUTFILE` clause is allowed only for the final `SELECT` of a `UNION`, but this restriction was not being enforced correctly. (Bug#23345)
- With the `NO_AUTO_VALUE_ON_ZERO` SQL mode enabled, `LAST_INSERT_ID()` could return 0 after `INSERT ... ON DUPLICATE KEY UPDATE`. Additionally, the next rows inserted (by the same `INSERT`, or the following `INSERT` with or without `ON DUPLICATE KEY UPDATE`), would insert 0 for the auto-generated value if the value for the `AUTO_INCREMENT` column was `NULL` or missing. (Bug#23233)
- `SOUNDEX()` returned an invalid string for international characters in multi-byte character sets. (Bug#22638)
- `COUNT(decimal_expr)` sometimes generated a spurious truncation warning. (Bug#21976)
- For `InnoDB`, fixed consistent-read behavior of the first read statement, if the read was served from the query cache, for the `READ COMMITTED` isolation level. (Bug#21409)
- For a stored procedure containing a `SELECT` statement that used a complicated join with an `ON` expression, the expression could be ignored during re-execution of the procedure, yielding an incorrect result. (Bug#20492)
- In some cases, the optimizer preferred a range or full index scan access method over lookup access methods when the latter were much cheaper. (Bug#19372)
- When trying to create tables on an SQL node not connected to the cluster, a misleading error message `TABLE 'TBL_NAME' ALREADY EXISTS` was generated. The error now generated is `COULD NOT CONNECT TO STORAGE ENGINE`. (Bug#18676)
- Conversion of `DATETIME` values in numeric contexts sometimes did not produce a double (`YYYYMMDDHHMMSS.uuuuuu`) value. (Bug#16546)
- The patch for the following bugs was reverted: Bug#19370, Bug#21789.

C.1.9. Release Notes for MySQL Enterprise 5.0.38 (20 March 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.36).

Functionality added or changed:

- The server now includes a timestamp in error messages that are logged as a result of unhandled signals (such as `mysqld got`

signal 11 messages). (Bug#24878)

- Added the `--secure-file-priv` option for `mysqld`, which limits the effect of the `LOAD_FILE()` function and the `LOAD DATA` and `SELECT ... INTO OUTFILE` statements to work only with files in a given directory. (Bug#18628)
- Added the `hostname` system variable, which the server sets at startup to the server hostname.
- To satisfy different user requirements, we provide several servers. `mysqld` is an optimized server that is a smaller, faster binary. Each package now also includes `mysqld-debug`, which is compiled with debugging support but is otherwise configured identically to the non-debug server.

Bugs fixed:

- **Incompatible Change:** `INSERT DELAYED` statements are not supported for `MERGE` tables, but the `MERGE` storage engine was not rejecting such statements, resulting in table corruption. Applications previously using `INSERT DELAYED` into `MERGE` table will break when upgrading to versions with this fix. To avoid the problem, remove `DELAYED` from such statements. (Bug#26464)
- **MySQL Cluster:** An inadvertent use of unaligned data caused `ndb_restore` to fail on some 64-bit platforms, including Sparc and Itanium-2. (Bug#26739)
- **MySQL Cluster:** An invalid pointer was returned following a `FSCLOSECONF` signal when accessing the REDO logs during a node restart or system restart. (Bug#26515)
- **MySQL Cluster:** The failure of a data node when restarting it with `--initial` could lead to failures of subsequent data node restarts. (Bug#26481)
- **MySQL Cluster:** Takeover for local checkpointing due to multiple failures of master nodes was sometimes incorrectly handled. (Bug#26457)
- **MySQL Cluster:** The `LockPagesInMemory` parameter was not read until after distributed communication had already started between cluster nodes. When the value of this parameter was 1, this could sometimes result in data node failure due to missed heartbeats. (Bug#26454)
- **MySQL Cluster:** Under some circumstances, following the restart of a management, all cluster data nodes would connect to it normally, but some of them subsequently failed to log any events to the management node. (Bug#26293)
- **MySQL Cluster:** An error was produced when `SHOW TABLE STATUS` was used on an `NDB` table that had no `AUTO_INCREMENT` column. (Bug#21033)
- `SELECT ... INTO OUTFILE` with a long `FIELDS ENCLOSED BY` value could crash the server. (Bug#27231)
- An `INSERT ... ON DUPLICATE KEY UPDATE` statement might modify values in a table but not flush affected data from the query cache, causing subsequent selects to return stale results. This made the combination of query cache plus `ON DUPLICATE KEY UPDATE` very unreliable. (Bug#27006, Bug#27210)

This regression was introduced by Bug#19978

- For `MERGE` tables defined on underlying tables that contained a short `VARCHAR` column (shorter than four characters), using `ALTER TABLE` on at least one but not all of the underlying tables caused the table definitions to be considered different from that of the `MERGE` table, even if the `ALTER TABLE` did not change the definition. (Bug#26881)
- Use of a subquery containing `GROUP BY` and `WITH ROLLUP` caused a server crash. (Bug#26830)
- Added support for `--debugger=dbx` for `mysql-test-run.pl` and fixed support for `--debugger=devenv`, `--debugger=DevEnv`, and `--debugger=/path/to/devenv`. (Bug#26792)
- An infinite loop in an internal logging function could cause trace logs to fill up with `UNKNOWN SIGNAL TYPE` error messages and thus grow to unreasonable sizes. (Bug#26720)
- SSL connections failed on Windows. (Bug#26678)
- Use of a subquery containing a `UNION` with an invalid `ORDER BY` clause caused a server crash. (Bug#26661)
- In some error messages, inconsistent format specifiers were used for the translations in different languages. `comp_err` (the error message compiler) now checks for mismatches. (Bug#26571)
- Views that used a scalar correlated subquery returned incorrect results. (Bug#26560)

- `UNHEX() IS NULL` comparisons failed when `UNHEX()` returned `NULL`. (Bug#26537)
- On 64-bit Windows, large timestamp values could be handled incorrectly. (Bug#26536)
- For some values of the position argument, the `INSERT()` function could insert a NUL byte into the result. (Bug#26281)
- `INSERT DELAYED` statements inserted incorrect values into `BIT` columns. (Bug#26238)
- A multiple-row delayed insert with an auto-increment column could cause duplicate entries to be created on the slave in a replication environment. (Bug#26116, Bug#25507)
- `BENCHMARK()` did not work correctly for expressions that produced a `DECIMAL` result. (Bug#26093)
- `LOAD DATA INFILE` sent an okay to the client before writing the binary log and committing the changes to the table had finished, thus violating ACID requirements. (Bug#26050)
- `X() IS NULL` and `Y() IS NULL` comparisons failed when `X()` and `Y()` returned `NULL`. (Bug#26038)
- Indexes on `TEXT` columns were ignored when `ref` accesses were evaluated. (Bug#25971)
- If a thread previously serviced a connection that was killed, excessive memory and CPU use by the thread occurred if it later serviced a connection that had to wait for a table lock. (Bug#25966)
- `VIEW` restrictions were applied to `SELECT` statements after a `CREATE VIEW` statement failed, as though the `CREATE` had succeeded. (Bug#25897)
- Several deficiencies in resolution of column names for `INSERT ... SELECT` statements were corrected. (Bug#25831)
- Inserting `utf8` data into a `TEXT` column that used a single-byte character set could result in spurious warnings about truncated data. (Bug#25815)
- In certain cases it could happen that deleting a row corrupted an `R-Tree` index. This affected indexes on spatial columns. (Bug#25673)
- Expressions involving `SUM()`, when used in an `ORDER BY` clause, could lead to out-of-order results. (Bug#25376)
- Use of a `GROUP BY` clause that referred to a stored function result together with `WITH ROLLUP` caused incorrect results. (Bug#25373)
- A stored procedure that made use of cursors failed when the procedure was invoked from a stored function. (Bug#25345)
- On Windows, the server exhibited a file-handle leak after reaching the limit on the number of open file descriptors. (Bug#25222)
- The `REPEAT()` function did not allow a column name as the `count` parameter. (Bug#25197)
- Duplicating the usage of a user variable in a stored procedure or trigger would not be replicated correctly to the slave. (Bug#25167)
- A reference to a non-existent column in the `ORDER BY` clause of an `UPDATE ... ORDER BY` statement could cause a server crash. (Bug#25126)
- A view on a join is insertable for `INSERT` statements that store values into only one table of the join. However, inserts were being rejected if the inserted-into table was used in a self-join because MySQL incorrectly was considering the insert to modify multiple tables of the view. (Bug#25122)
- MySQL would not compile when configured using `--without-query-cache`. (Bug#25075)
- `IF(expr, unsigned_expr, unsigned_expr)` was evaluated to a signed result, not unsigned. This has been corrected. The fix also affects constructs of the form `IS [NOT] {TRUE|FALSE}`, which were transformed internally into `IF()` expressions that evaluated to a signed result.

For existing views that were defined using `IS [NOT] {TRUE|FALSE}` constructs, there is a related implication. The definitions of such views were stored using the `IF()` expression, not the original construct. This is manifest in that `SHOW CREATE VIEW` shows the transformed `IF()` expression, not the original one. Existing views will evaluate correctly after the fix, but if you want `SHOW CREATE VIEW` to display the original construct, you must drop the view and re-create it using its original definition. New views will retain the construct in their definition. (Bug#24532)

- `DROP TRIGGER` statements would not be filtered on the slave when using the `replication-wild-do-table` option. (Bug#24478)

- For `INSERT ... ON DUPLICATE KEY UPDATE` statements where some `AUTO_INCREMENT` values were generated automatically for inserts and some rows were updated, one auto-generated value was lost per updated row, leading to faster exhaustion of the range of the `AUTO_INCREMENT` column.

Because the original problem can affect replication (different values on master and slave), it is recommended that the master and its slaves be upgraded to the current version. (Bug#24432)
- Queries that used a temporary table for the outer query when evaluating a correlated subquery could return incorrect results. (Bug#23800)
- `DOUBLE` values such as `20070202191048.000000` were being treated as illegal arguments by `WEEK()`. (Bug#23616)
- The server could crash if two or more threads initiated query cache resize operation at moments very close in time. (Bug#23527)
- `NOW()` returned the wrong value in statements executed at server startup with the `--init-file` option. (Bug#23240)
- When nesting stored procedures within a trigger on a table, a false dependency error was thrown when one of the nested procedures contained a `DROP TABLE` statement. (Bug#22580)
- Instance Manager did not remove the angel PID file on a clean shutdown. (Bug#22511)
- `EXPLAIN EXTENDED` did not show `WHERE` conditions that were optimized away. (Bug#22331)
- `IN ((subquery))`, `IN (((subquery)))`, and so forth, are equivalent to `IN (subquery)`, which is always interpreted as a table subquery (so that it is allowed to return more than one row). MySQL was treating the “over-parenthesized” subquery as a single-row subquery and rejecting it if it returned more than one row. This bug primarily affected automatically generated code (such as queries generated by Hibernate), because humans rarely write the over-parenthesized forms. (Bug#21904)
- An `INSERT` trigger invoking a stored routine that inserted into a table other than the one on which the trigger was defined would fail with a `TABLE '...' DOESN'T EXIST` referring to the second table when attempting to delete records from the first table. (Bug#21825)
- When a stored routine attempted to execute a statement accessing a nonexistent table, the error was not caught by the routine's exception handler. (Bug#20713, Bug#8407)
- The conditions checked by the optimizer to allow use of indexes in `IN` predicate calculations were unnecessarily tight and were relaxed. (Bug#20420)
- When a `TIME_FORMAT()` expression was used as a column in a `GROUP BY` clause, the expression result was truncated. (Bug#20293)
- When using certain server SQL modes, the `mysql.proc` table was not created by `mysql_install_db`. In addition, the creation of this and other MySQL system tables was not checked for by `mysql-test-run.pl`. (Bug#20166, Bug#23669)
- For index reads, the `BLACKHOLE` engine did not return end-of-file (which it must because `BLACKHOLE` tables contain no rows), causing some queries to crash. (Bug#19717)
- For `expr IN(value_list)`, the result could be incorrect if `BIGINT UNSIGNED` values were used for `expr` or in the value list. (Bug#19342)
- When attempting to call a stored procedure creating a table from a trigger on a table `tbl` in a database `db`, the trigger failed with `ERROR 1146 (42S02): TABLE 'DB.TBL' DOESN'T EXIST`. However, the actual reason that such a trigger fails is due to the fact that `CREATE TABLE` causes an implicit `COMMIT`, and so a trigger cannot invoke a stored routine containing this statement. A trigger which does so now fails with `ERROR 1422 (HY000): EXPLICIT OR IMPLICIT COMMIT IS NOT ALLOWED IN STORED FUNCTION OR TRIGGER`, which makes clear the reason for the trigger's failure. (Bug#18914)
- A user-defined variable could be assigned an incorrect value if a temporary table was employed in obtaining the result of the query used to determine its value. (Bug#16861)
- The update columns for `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` could be assigned incorrect values if a temporary table was used to evaluate the `SELECT`. (Bug#16630)
- For `SUBSTRING()` evaluation using a temporary table, when `SUBSTRING()` was used on a `LONGTEXT` column, the `max_length` metadata value of the result was incorrectly calculated and set to 0. Consequently, an empty string was returned instead of the correct result. (Bug#15757)
- Loading data using `LOAD DATA INFILE` may not replicate correctly (due to character set incompatibilities) if the `character_set_database` variable is set before the data is loaded. (Bug#15126)

- User defined variables used within stored procedures and triggers are not replicated correctly when operating in statement-based replication mode. (Bug#14914, Bug#20141)
- Local variables in stored routines or triggers, when declared as the `BIT` type, were interpreted as strings. (Bug#12976)
- `CONNECTION` is no longer treated as a reserved word. (Bug#12204)

C.1.10. Release Notes for MySQL Enterprise 5.0.36sp1 (12 April 2007)

This is a *Service Pack* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.36).

Bugs fixed:

- `SELECT ... INTO OUTFILE` with a long `FIELDS ENCLOSED BY` value could crash the server. (Bug #Bug#27231)
- For `MERGE` tables defined on underlying tables that contained a short `VARCHAR` column (shorter than four characters), using `ALTER TABLE` on at least one but not all of the underlying tables caused the table definitions to be considered different from that of the `MERGE` table, even if the `ALTER TABLE` did not change the definition. (Bug #Bug#26881)

C.1.11. Release Notes for MySQL Enterprise 5.0.36 (20 February 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

Note

After release, a trigger failure problem was found to have been introduced. (Bug#27006) Users affected by this issue should upgrade to MySQL 5.0.38, which corrects the problem.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.34).

Functionality added or changed:

- **Incompatible Change:** Previously, the `DATE_FORMAT()` function returned a binary string. Now it returns a string with a character set and collation given by `character_set_connection` and `collation_connection` so that it can return month and weekday names containing non-ASCII characters. (Bug#22646)
- **MySQL Cluster:** The `LockPagesInMainMemory` configuration parameter has changed its type and possible values. For more information, see `LockPagesInMainMemory`.

Important

The values `true` and `false` are no longer accepted for this parameter. If you were using this parameter and had it set to `false` in a previous release, you must change it to `0`. If you had this parameter set to `true`, you should instead use `1` to obtain the same behavior as previously, or `2` to take advantage of new functionality introduced with this release described in the section cited above.

(Bug#25686)

- The `localhost` anonymous user account created during MySQL installation on Windows now has no global privileges. Formerly this account had all global privileges. For operations that require global privileges, the `root` account can be used instead. (Bug#24496)

Important

When using `MERGE` tables the definition of the `MERGE` table and the `MyISAM` tables are checked each time the tables are opened for access (including any `SELECT` or `INSERT` statement). Each table is compared for column order, types, sizes and associated. If there is a difference in any one of the tables then the statement will fail.

- The bundled yaSSL library was upgraded to version 1.5.8.

Bugs fixed:

- **Security Fix:** Using an `INFORMATION_SCHEMA` table with `ORDER BY` in a subquery could cause a server crash. We would like to thank Oren Isacson from Flowgate Security Consulting as well as Stefan Streichsbier from SEC Consult for informing us about this problem. (Bug#24630, Bug#26556, CVE-2007-1420)
- **Incompatible Change:** For `ENUM` columns that had enumeration values containing commas, the commas were mapped to `0xff` internally. However, this rendered the commas indistinguishable from true `0xff` characters in the values. This no longer occurs. However, the fix requires that you dump and reload any tables that have `ENUM` columns containing true `0xff` in their values: Dump the tables using `mysqldump` with the current server before upgrading from a version of MySQL 5.0 older than 5.0.36 to version 5.0.36 or newer. (Bug#24660)
- **MySQL Cluster:** A query with an `IN` clause against an `NDB` table employing explicit user-defined partitioning did not always return all matching rows. (Bug#25821)
- **MySQL Cluster:** It was not possible to create an `NDB` table with a key on two `VARCHAR` columns where both columns had a storage length in excess of 256. (Bug#25746)
- **MySQL Cluster:** In some circumstances, shutting down the cluster could cause connected `mysqld` processes to crash. (Bug#25668)
- **MySQL Cluster:** Memory allocations for `TEXT` columns were calculated incorrectly, resulting in space being wasted and other issues. (Bug#25562)
- **MySQL Cluster:** The failure of a master node during a node restart could lead to a resource leak, causing later node failures. (Bug#25554)
- **MySQL Cluster:** An `UPDATE` using an `IN` clause on an `NDB` table on which there was a trigger caused `mysqld` to crash. (Bug#25522)
- **MySQL Cluster:** (Cluster APIs): Deletion of an `Ndb_cluster_connection` object took a very long time. (Bug#25487)
- **MySQL Cluster:** A node shutdown occurred if the master failed during a commit. (Bug#25364)
- **MySQL Cluster:** Creating a non-unique index with the `USING HASH` clause silently created an ordered index instead of issuing a warning. (Bug#24820)
- **MySQL Cluster:** The `ndb_size.tmp` file (necessary for using the `ndb_size.pl` script) was missing from binary distributions. (Bug#24191)
- **MySQL Cluster:** The management server did not handle logging of node shutdown events correctly in certain cases. (Bug#22013)
- **MySQL Cluster:** `SELECT` statements with a `BLOB` or `TEXT` column in the selected column list and a `WHERE` condition including a primary key lookup on a `VARCHAR` primary key produced empty result sets. (Bug#19956)
- **MySQL Cluster:** (Cluster APIs): `libndbclient.so` was not versioned. (Bug#13522)
- Using `ORDER BY` or `GROUP BY` could yield different results when selecting from a view and selecting from the underlying table. (Bug#26209)
- `DISTINCT` queries that were executed using a loose scan for an `InnoDB` table that had been emptied caused a server crash. (Bug#26159)
- A `WHERE` clause that used `BETWEEN` for `DATETIME` values could be treated differently for a `SELECT` and a view defined as that `SELECT`. (Bug#26124)
- Collation for `LEFT JOIN` comparisons could be evaluated incorrectly, leading to improper query results. (Bug#26017)
- The `WITH CHECK OPTION` clause for views was ignored for updates of multiple-table views when the updates could not be performed on fly and the rows to update had to be put into temporary tables first. (Bug#25931)
- `LOAD DATA INFILE` did not work with pipes. (Bug#25807)
- The `SEC_TO_TIME()` and `QUARTER()` functions sometimes did not handle `NULL` values correctly. (Bug#25643)
- The `InnoDB` parser sometimes did not account for null bytes, causing spurious failure of some queries. (Bug#25596)
- View definitions that used the `!` operator were treated as containing the `NOT` operator, which has a different precedence and can produce different results. (Bug#25580)
- An error in the name resolution of nested `JOIN ... USING` constructs was corrected. (Bug#25575)

- `GROUP BY` and `DISTINCT` did not group `NULL` values for columns that have a `UNIQUE` index. . (Bug#25551)
- The `--with-readline` option for `configure` does not work for commercial source packages, but no error message was printed to that effect. Now a message is printed. (Bug#25530)
- A yaSSL program named `test` was installed, causing conflicts with the `test` system utility. It is no longer installed. (Bug#25417)
- For a `UNIQUE` index containing many `NULL` values, the optimizer would prefer the index for `col IS NULL` conditions over other more selective indexes. . (Bug#25407)
- An `AFTER UPDATE` trigger on an InnoDB table with a composite primary key caused the server to crash. (Bug#25398)
- Passing a `NULL` value to a user-defined function from within a stored procedure crashes the server. (Bug#25382)
- `perror` crashed on some platforms due to failure to handle a `NULL` pointer. (Bug#25344)
- `mysql.server stop` timed out too quickly (35 seconds) waiting for the server to exit. Now it waits up to 15 minutes, to ensure that the server exits. (Bug#25341)
- A query that contained an `EXIST` subquery with a `UNION` over correlated and uncorrelated `SELECT` queries could cause the server to crash. (Bug#25219)
- `mysql_kill()` caused a server crash when used on an SSL connection. (Bug#25203)
- yaSSL was sensitive to the presence of whitespace at the ends of lines in PEM-encoded certificates, causing a server crash. (Bug#25189)
- A query with `ORDER BY` and `GROUP BY` clauses where the `ORDER BY` clause had more elements than the `GROUP BY` clause caused a memory overrun leading to a crash of the server. (Bug#25172)
- Use of `ON DUPLICATE KEY UPDATE` defeated the usual restriction against inserting into a join-based view unless only one of the underlying tables is used. (Bug#25123)
- `ALTER TABLE ... ENABLE KEYS` acquired a global lock, preventing concurrent execution of other statements that use tables. . (Bug#25044)
- A return value of `-1` from user-defined handlers was not handled well and could result in conflicts with server code. (Bug#24987)
- Accessing a fixed record format table with a crashed key definition results in server/`myisamchk` segmentation fault. (Bug#24855)
- `mysqld_multi` and `mysqlaccess` looked for option files in `/etc` even if the `--sysconfdir` option for `configure` had been given to specify a different directory. (Bug#24780)
- If there was insufficient memory available to `mysqld`, this could sometimes cause the server to hang during startup. (Bug#24751)
- If an `ORDER BY` or `GROUP BY` list included a constant expression being optimized away and, at the same time, containing single-row subselects that return more than one row, no error was reported. If a query requires sorting by expressions containing single-row subselects that return more than one row, execution of the query may cause a server crash. (Bug#24653)
- For `ALTER TABLE`, using `ORDER BY expression` could cause a server crash. Now the `ORDER BY` clause allows only column names to be specified as sort criteria (which was the only documented syntax, anyway). (Bug#24562)
- A workaround was implemented to avoid a race condition in the NPTL `pthread_exit()` implementation. (Bug#24507)
- `mysqltest` crashed with a stack overflow. (Bug#24498)
- Within stored routines or prepared statements, inconsistent results occurred with multiple use of `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` when the `ON DUPLICATE KEY UPDATE` clause erroneously tried to assign a value to a column mentioned only in its `SELECT` part. (Bug#24491)
- Expressions of the form `(a, b) IN (SELECT a, MIN(b) FROM t GROUP BY a)` could produce incorrect results when column `a` of table `t` contained `NULL` values while column `b` did not. (Bug#24420)
- If a prepared statement accessed a view, access to the tables listed in the query after that view was checked in the security context of the view. (Bug#24404)
- Attempts to access a `MyISAM` table with a corrupt column definition caused a server crash. (Bug#24401)

- When opening a corrupted `.frm` file during a query, the server crashes. (Bug#24358)
- A query using `WHERE unsigned_column NOT IN ('negative_value')` could cause the server to crash. (Bug#24261)
- When `SET PASSWORD` was written to the binary log double quotes were included in the statement. If the slave was running in with the `sql_mode` set to `ANSI_QUOTES` the event would fail and halt the replication process. (Bug#24158)
- SSL connections could hang at connection shutdown. (Bug#24148)
- Expressions of the form `(a, b) IN (SELECT c, d ...)` could produce incorrect results if `a`, `b`, or both were `NULL`. (Bug#24127)
- A `FETCH` statement using a cursor on a table which was not in the table cache could sometimes cause the server to crash. (Bug#24117)
- Queries that evaluate `NULL IN (SELECT ... UNION SELECT ...)` could produce an incorrect result (`FALSE` instead of `NULL`). (Bug#24085)
- Hebrew-to-Unicode conversion failed for some characters. Definitions for the following Hebrew characters (as specified by the ISO/IEC 8859-8:1999) were added: LEFT-TO-RIGHT MARK (LRM), RIGHT-TO-LEFT MARK (RLM) (Bug#24037)
- Some `UPDATE` statements were slower than in previous versions when the search key could not be converted to a valid value for the type of the search column. (Bug#24035)
- `ISNULL(DATE(NULL))` and `ISNULL(CAST(NULL AS DATE))` erroneously returned false. (Bug#23938)
- Within a stored routine, accessing a declared routine variable with `PROCEDURE ANALYSE()` caused a server crash. (Bug#23782)
- When reading from the standard input on Windows, `mysqlbinlog` opened the input in text mode rather than binary mode and consequently misinterpreted some characters such as Control-Z. (Bug#23735)
- A stored procedure, executed from a connection using a binary character set, and which wrote multibyte data, would write incorrectly escaped entries to the binary log. This caused syntax errors, and caused replication to fail. (Bug#23619, Bug#24492)
- For an `InnoDB` table with any `ON DELETE` trigger, `TRUNCATE TABLE` mapped to `DELETE` and activated triggers. Now a fast truncation occurs and triggers are not activated. (Bug#23556)
- The row count for `MyISAM` tables was not updated properly, causing `SHOW TABLE STATUS` to report incorrect values. (Bug#23526)
- With `ONLY_FULL_GROUP_BY` enables, the server was too strict: Some expressions involving only aggregate values were rejected as non-aggregate (for example, `MAX(a) - MIN(a)`). (Bug#23417)
- The arguments of the `ENCODE()` and the `DECODE()` functions were not printed correctly, causing problems in the output of `EXPLAIN EXTENDED` and in view definitions. (Bug#23409)
- Some queries against `INFORMATION_SCHEMA` that used subqueries failed. (Bug#23299)
- `readline` detection did not work correctly on NetBSD. (Bug#23293)
- If there was insufficient memory to store or update a blob record in a `MyISAM` table then the table will marked as crashed. (Bug#23196)
- `LAST_INSERT_ID()` was not reset to 0 if `INSERT ... SELECT` inserted no rows. (Bug#23170)
- The number of `setsockopt()` calls performed for reads and writes to the network socket was reduced to decrease system call overhead. (Bug#22943)
- `mysql_upgrade` failed when called with a `basedir` pathname containing spaces. (Bug#22801)
- `SET lc_time_names = value` allowed only exact literal values, not expression values. (Bug#22647)
- Changes to the `lc_time_names` system variable were not replicated. (Bug#22645)
- The `STDDEV()` function returned a positive value for data sets consisting of a single value. (Bug#22555)
- Storing values specified as hexadecimal values 64 or more bits long into `BIT(64)`, `BIGINT`, or `BIGINT UNSIGNED` columns did not raise any warning or error if the value was out of range. (Bug#22533)

- `SHOW COLUMNS` reported some `NOT NULL` columns as `NULL`. (Bug#22377)
- Type conversion errors during formation of index search conditions were not correctly checked, leading to incorrect query results. (Bug#22344)
- Re-execution of `CREATE DATABASE`, `CREATE TABLE`, and `ALTER TABLE` statements in stored routines or as prepared statements caused incorrect results or crashes. (Bug#22060)
- The code for generating `USE` statements for binary logging of `CREATE PROCEDURE` statements resulted in confusing output from `mysqlbinlog` for `DROP PROCEDURE` statements. (Bug#22043)
- For the `IF()` and `COALESCE()` function and `CASE` expressions, large unsigned integer values could be mishandled and result in warnings. (Bug#22026)
- When updating a table that used a `JOIN` of the table itself (for example, when building trees) and the table was modified on one side of the expression, the table would either be reported as crashed or the wrong rows in the table would be updated. (Bug#21310)
- Inserting `DEFAULT` into a column with no default value could result in garbage in the column. Now the same result occurs as when inserting `NULL` into a `NOT NULL` column. (Bug#20691)
- A stored routine containing semicolon in its body could not be reloaded from a dump of a binary log. (Bug#20396)
- `SELECT ... FOR UPDATE`, `SELECT ... LOCK IN SHARE MODE`, `DELETE`, and `UPDATE` statements executed using a full table scan were not releasing locks on rows that did not satisfy the `WHERE` condition. (Bug#20390)
- On Windows, if the server was installed as a service, it did not auto-detect the location of the data directory. (Bug#20376)
- The `BUILD/check-cpu` script did not recognize Celeron processors. (Bug#20061)
- If the duplicate key value was present in the table, `INSERT ... ON DUPLICATE KEY UPDATE` reported a row count indicating that a record was updated, even when no record actually changed due to the old and new values being the same. Now it reports a row count of zero. (Bug#19978)
- For `SET`, `SELECT`, and `DO` statements that invoked a stored function from a database other than the default database, the function invocation could fail to be replicated. (Bug#19725)
- `ORDER BY` on `DOUBLE` values could change the set of rows returned by a query. (Bug#19690)
- The `readline` library wrote to uninitialized memory, causing `mysql` to crash. (Bug#19474)
- `mysqltest` incorrectly tried to retrieve result sets for some queries where no result set was available. (Bug#19410)
- Use of already freed memory caused SSL connections to hang forever. (Bug#19209)
- The server might fail to use an appropriate index for `DELETE` when `ORDER BY`, `LIMIT`, and a non-restricting `WHERE` are present. (Bug#17711)
- No warning was issued for use of the `DATA DIRECTORY` or `INDEX DIRECTORY` table options on a platform that does not support them. (Bug#17498)
- When a prepared statement failed during the prepare operation, the error code was not cleared when it was reused, even if the subsequent use was successful. (Bug#15518)
- On Windows, the `SLEEP()` function could sleep too long, especially after a change to the system clock. (Bug#14094, Bug#24686, Bug#17635)
- `mysqldump --order-by-primary` failed if the primary key name was an identifier that required quoting. (Bug#13926)
- To enable installation of MySQL RPMs on Linux systems running RHEL 4 (which includes SE-Linux) additional information was provided to specify some actions that are allowed to the MySQL binaries. (Bug#12676)
- The presence of `ORDER BY` in a view definition prevented the `MERGE` algorithm from being used to resolve the view even if nothing else in the definition required the `TEMPTABLE` algorithm. (Bug#12122)
- If a slave server closed its relay log (for example, due to an error during log rotation), the I/O thread did not recognize this and still tried to write to the log, causing a server crash. (Bug#10798)

C.1.12. Release Notes for MySQL Enterprise 5.0.34 (17 January 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.32).

Functionality added or changed:

- The `--skip-thread-priority` option now is enabled by default for binary Mac OS X distributions. Use of thread priorities degrades performance on Mac OS X. (Bug#18526)
- Added the `--disable-grant-options` option to `configure`. If `configure` is run with this option, the `--bootstrap`, `--skip-grant-tables`, and `--init-file` options for `mysqld` are disabled and cannot be used. For Windows, the `configure.js` script recognizes the `DISABLE_GRANT_OPTIONS` flag, which has the same effect.

Bugs fixed:

- **MySQL Cluster:** Hosts in clusters with a large number of nodes could experience excessive CPU usage while obtaining configuration data. (Bug#25711)
- **MySQL Cluster:** (NDB API): Invoking the `NdbTransaction::execute()` method using execution type `Commit` and abort option `AO_IgnoreError` could lead to a crash of the transaction coordinator (DBTC). (Bug#25090)
- **MySQL Cluster:** (NDB API): A unique index lookup on a non-existent tuple could lead to a data node timeout (error 4012). (Bug#25059)
- Referencing an ambiguous column alias in an expression in the `ORDER BY` clause of a query caused the server to crash. (Bug#25427)
- Using a view in combination with a `USING` clause caused column aliases to be ignored. (Bug#25106)
- A multiple-table `DELETE QUICK` could sometimes cause one of the affected tables to become corrupted. (Bug#25048)
- An assertion failed incorrectly for prepared statements that contained a single-row uncorrelated subquery that was used as an argument of the `IS NULL` predicate. (Bug#25027)
- Optimizations that are legal only for subqueries without tables and `WHERE` conditions were applied for any subquery without tables. (Bug#24670)
- Some joins in which one of the joined tables was a view could return erroneous results or crash the server. (Bug#24345)
- A view was not handled correctly if the `SELECT` part contained “\z”. (Bug#24293)
- The server was built even when `configure` was run with the `--without-server` option. (Bug#23973)
- `OPTIMIZE TABLE` tried to sort R-tree indexes such as spatial indexes, although this is not possible (see Section 12.5.2.5, “`OPTIMIZE TABLE` Syntax”). (Bug#23578)
- User-defined variables could consume excess memory, leading to a crash caused by the exhaustion of resources available to the `MEMORY` storage engine, due to the fact that this engine is used by MySQL for variable storage and intermediate results of `GROUP BY` queries. Where `SET` had been used, such a condition could instead give rise to the misleading error message `YOU MAY ONLY USE CONSTANT EXPRESSIONS WITH SET`, rather than `OUT OF MEMORY (NEEDED NNNNNN BYTES)`. (Bug#23443)
- A table created with the `ROW_FORMAT = FIXED` table option loses the option if an index is added or dropped with `CREATE INDEX` or `DROP INDEX`. (Bug#23404)
- A deadlock could occur, with the server hanging on `Closing tables`, with a sufficient number of concurrent `INSERT DELAYED`, `FLUSH TABLES`, and `ALTER TABLE` operations. (Bug#23312)
- A compressed `MyISAM` table that became corrupted could crash `myisamchk` and possibly the MySQL Server. (Bug#23139)
- When a data node was shut down using the management client `STOP` command, a connection event (`NDB_LE_Connected`) was logged instead of a disconnection event (`NDB_LE_Disconnected`). (Bug#22773)
- Changing the value of `MI_KEY_BLOCK_LENGTH` in `myisam.h` and recompiling MySQL resulted in a `myisamchk` that saw existing `MyISAM` tables as corrupt. (Bug#22119)
- A crash of the MySQL Server could occur when unpacking a `BLOB` column from a row in a corrupted `MyISAM` table. This could happen when trying to repair a table using either `REPAIR TABLE` or `myisamchk`; it could also happen when trying to access such a “broken” row using statements like `SELECT` if the table was not marked as crashed. (Bug#22053)

- The `FEDERATED` storage engine did not support the `euckr` character set. (Bug#21556)
- `mysqld_error.h` was not installed when only the client libraries were built. (Bug#21265)
- `InnoDB`: During a restart of the MySQL Server that followed the creation of a temporary table using the `InnoDB` storage engine, MySQL failed to clean up in such a way that `InnoDB` still attempted to find the files associated with such tables. (Bug#20867)
- Some `CASE` statements inside stored routines could lead to excessive resource usage or a crash of the server. (Bug#19194, Bug#24854)
- Instance Manager could crash during shutdown. (Bug#19044)
- The `FEDERATED` storage engine did not support the `utf8` character set. (Bug#17044)
- A user-defined variable could be assigned an incorrect value if a temporary table was employed in obtaining the result of the query used to determine its value. (Bug #Bug#16861)
- The optimizer removes expressions from `GROUP BY` and `DISTINCT` clauses if they happen to participate in `expression = constant` predicates of the `WHERE` clause, the idea being that, if the expression is equal to a constant, then it cannot take on multiple values. However, for predicates where the expression and the constant item are of different result types (for example, when a string column is compared to 0), this is not valid, and can lead to invalid results in such cases. The optimizer now performs an additional check of the result types of the expression and the constant; if their types differ, then the expression is not removed from the `GROUP BY` list. (Bug#15881)
- Dropping a user-defined function sometimes did not remove the UDF entry from the `mysql.proc` table. (Bug#15439)
- Inserting a row into a table without specifying a value for a `BINARY(N) NOT NULL` column caused the column to be set to spaces, not zeroes. (Bug#14171)

C.1.13. Release Notes for MySQL Enterprise 5.0.32 (20 December 2006)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.30).

Functionality added or changed:

- **Incompatible Change:** In MySQL 5.0.13 and up, `InnoDB` rolls back only the last statement on a transaction timeout. A new option, `--innodb_rollback_on_timeout`, causes `InnoDB` to abort and roll back the entire transaction if a transaction timeout occurs (the same behavior as before MySQL 5.0.13). (Bug#24200)
- **Incompatible Change:** The `prepared_stmt_count` system variable has been converted to the `Prepared_stmt_count` global status variable (viewable with the `SHOW GLOBAL STATUS` statement). (Bug#23159)
- **MySQL Cluster:** Setting the configuration parameter `LockPagesInMainMemory` had no effect. (Bug#24461)
- **MySQL Cluster:** It is now possible to create a unique hashed index on a column that is not defined as `NOT NULL`. *Note that this change applies only to tables using the `NDB` storage engine.*

Unique indexes on columns in `NDB` tables do not store null values because they are mapped to primary keys in an internal index table (and primary keys cannot contain nulls).

Normally, an additional ordered index is created when one creates unique indexes on `NDB` table columns; this can be used to search for `NULL` values. However, if `USING HASH` is specified when such an index is created, no ordered index is created.

The reason for permitting unique hash indexes with null values is that, in some cases, the user wants to save space if a large number of records are pre-allocated but not fully initialized. This also assumes that the user will *not* try to search for null values. Since MySQL does not support indexes that are not allowed to be searched in some cases, the `NDB` storage engine uses a full table scan with pushed conditions for the referenced index columns to return the correct result.

Note that a warning is returned if one creates a unique nullable hash index, since the query optimizer should be provided a hint not to use it with `NULL` values if this can be avoided. (Bug#21507)

- `DROP TRIGGER` now supports an `IF EXISTS` clause. (Bug#23703)
- The `Com_create_user` status variable was added (for counting `CREATE USER` statements). (Bug#22958)
- The `--memlock` option relies on system calls that are unreliable on some operating systems. If a crash occurs, the server now

checks whether `--memlock` was specified and if so issues some information about possible workarounds. (Bug#22860)

- The bundled yaSSL library was upgraded to version 1.5.0.

Bugs fixed:

- **MySQL Cluster:** The failure of a data node failure during a schema operation could lead to additional node failures. (Bug#24752)
- **MySQL Cluster:** A committed read could be attempted before a data node had time to connect, causing a timeout error. (Bug#24717)
- **MySQL Cluster:** (Cluster APIs): Using `BIT` values with any of the comparison methods of the `NdbScanFilter` class caused the cluster's data nodes to fail. (Bug#24503)
- **MySQL Cluster:** Sudden disconnection of an SQL or data node could lead to shutdown of data nodes with the error `FAILED NDBREQUIRE`. (Bug#24447)
- **MySQL Cluster:** (Cluster APIs): Some MGM API function calls could yield incorrect return values in certain cases where the cluster was operating under a very high load, or experienced timeouts in inter-node communications. (Bug#24011)
- **MySQL Cluster:** `ndb_config` failed when trying to use 2 management servers and node IDs. (Bug#23887)
- **MySQL Cluster:** If the value set for `MaxNoOfAttributes` is excessive, a suitable error message is now returned. (Bug#19352)
- **MySQL Cluster:** A unique constraint violation was not ignored by an `UPDATE IGNORE` statement when the constraint violation occurred on a non-primary key. (Bug#18487, Bug#24303)
- The `REPEAT()` function could return `NULL` when passed a column for the count argument. (Bug#24947)
- `mysql_upgrade` failed if the `--password` (or `-p`) option was given. (Bug#24896)
- With `innodb_file_per_table` enabled, InnoDB displayed incorrect file times in the output from `SHOW TABLE STATUS`. (Bug#24712)
- `ALTER ENABLE KEYS` or `ALTER TABLE DISABLE KEYS` combined with another `ALTER TABLE` option other than `RENAME TO` did nothing. In addition, if `ALTER TABLE` was used on a table having disabled keys, the keys of the resulting table were enabled. (Bug#24395)
- The InnoDB mutex structure was simplified to reduce memory load. (Bug#24386)
- The `--extern` option for `mysql-test-run.pl` did not function correctly. (Bug#24354)
- Foreign key identifiers for InnoDB tables could not contain certain characters. (Bug#24299)
- The `mysql.server` script used the `source` command, which is less portable than the `.` command; it now uses `.` instead. (Bug#24294)
- The loose index scan optimization for `GROUP BY` with `MIN` or `MAX` was not applied within other queries, such as `CREATE TABLE ... SELECT ...`, `INSERT ... SELECT ...`, or in the `FROM` clauses of subqueries. (Bug#24156)
- `ALTER TABLE` statements that performed both `RENAME TO` and `{ENABLE|DISABLE} KEYS` operations caused a server crash. (Bug#24089)
- Subqueries for which a pushed-down condition did not produce exactly one key field could cause a server crash. (Bug#24056)
- The size of `MEMORY` tables and internal temporary tables was limited to 4GB on 64-bit Windows systems. (Bug#24052)
- `ROW_COUNT()` did not work properly as an argument to a stored procedure. (Bug#23760)
- `LAST_DAY('0000-00-00')` could cause a server crash. (Bug#23653)
- A trigger that invoked a stored function could cause a server crash when activated by different client connections. (Bug#23651)
- The stack size for NetWare binaries was increased to 128KB to prevent problems caused by insufficient stack size. (Bug#23504)
- If elements in a non-top-level `IN` subquery were accessed by an index and the subquery result set included a `NULL` value, the quantified predicate that contained the subquery was evaluated to `NULL` when it should return a non-`NULL` value. (Bug#23478)

- When applying the `group_concat_max_len` limit, `GROUP_CONCAT()` could truncate multi-byte characters in the middle. (Bug#23451)
- `mysql_affected_rows()` could return values different from `mysql_stmt_affected_rows()` for the same sequence of statements. (Bug#23383)
- Accuracy was improved for comparisons between `DECIMAL` columns and numbers represented as strings. (Bug#23260)
- Calculation of `COUNT(DISTINCT)`, `AVG(DISTINCT)`, or `SUM(DISTINCT)` when they are referenced more than once in a single query with `GROUP BY` could cause a server crash. (Bug#23184)
- Changes to character set variables prior to an action on a replication-ignored table were forgotten by slave servers. (Bug#22877)
- Queries using a column alias in an expression as part of an `ORDER BY` clause failed, an example of such a query being `SELECT mycol + 1 AS mynum FROM mytable ORDER BY 30 - mynum`. (Bug#22457)
- Using `EXPLAIN` caused a server crash for queries that selected from `INFORMATION_SCHEMA` in a subquery in the `FROM` clause. (Bug#22413)
- A server crash occurred when using `LOAD DATA` to load a table containing a `NOT NULL` spatial column, when the statement did not load the spatial column. Now a `NULL supplied to NOT NULL column` error occurs. (Bug#22372)
- `DATE_ADD()` requires complete dates with no “zero” parts, but sometimes did not return `NULL` when given such a date. (Bug#22229)
- Some small double precision numbers (such as `1.00000001e-300`) that should have been accepted were truncated to zero. (Bug#22129)
- For a nonexistent table, `DROP TEMPORARY TABLE` failed with an incorrect error message if `read_only` was enabled. (Bug#22077)
- Trailing spaces were not removed from Unicode `CHAR` column values when used in indexes. This resulted in excessive usage of storage space, and could affect the results of some `ORDER BY` queries that made use of such indexes.

Note

When upgrading, it is necessary to re-create any existing indexes on Unicode `CHAR` columns in order to take advantage of the fix. This can be done by using a `REPAIR TABLE` statement on each affected table.

(Bug#22052)

- `STR_TO_DATE()` returned `NULL` if the format string contained a space following a non-format character. (Bug#22029)
- In some cases, the parser failed to distinguish a user-defined function from a stored function. (Bug#21809)
- Inserting a default or invalid value into a spatial column could fail with `Unknown error` rather than a more appropriate error. (Bug#21790)
- It was possible to use `DATETIME` values whose year, month, and day parts were all zeroes but whose hour, minute, and second parts contained nonzero values, an example of such an illegal `DATETIME` being `'0000-00-00 11:23:45'`. (Bug#21789)
- `yaSSL` crashed on pre-Pentium Intel CPUs. (Bug #Bug#21765)
- Evaluation of subqueries that require the filesort algorithm were allocating and freeing the `sort_buffer_size` buffer many times, resulting in slow performance. Now the buffer is allocated once and reused. (Bug#21727)
- Through the C API, the member strings in `MYSQL_FIELD` for a query that contains expressions may return incorrect results. (Bug#21635)
- View columns were always handled as having implicit derivation, leading to `illegal mix of collation errors` for some views in `UNION` operations. Now view column derivation comes from the original expression given in the view definition. (Bug#21505)
- `InnoDB` crashed while performing XA recovery of prepared transactions. (Bug#21468)
- `INET_ATON()` returned a signed `BIGINT` value, not an unsigned value. (Bug#21466)
- It was possible to set the backslash character (“\”) as the delimiter character using `DELIMITER`, but not actually possible to use it as the delimiter. (Bug#21412)

- Selecting into variables sometimes returned incorrect wrong results. (Bug#20836)
- On slave servers, transactions that exceeded the lock wait timeout failed to roll back properly. (Bug#20697)
- `CONCURRENT` did not work correctly for `LOAD DATA INFILE`. (Bug#20637)
- `mysql_fix_privilege_tables.sql` altered the `table_privs.table_priv` column to contain too few privileges, causing loss of the `CREATE VIEW` and `SHOW VIEW` privileges. (Bug#20589)
- With `lower_case_table_names` set to 1, `SHOW CREATE TABLE` printed incorrect output for table names containing Turkish I (LATIN CAPITAL LETTER I WITH DOT ABOVE). (Bug#20404)
- A query with a subquery that references columns of a view from the outer `SELECT` could return an incorrect result if used from a prepared statement. (Bug#20327)
- For queries that select from a view, the server was returning `MYSQL_FIELD` metadata inconsistently for view names and table names. For view columns, the server now returns the view name in the `table` field and, if the column selects from an underlying table, the table name in the `org_table` field. (Bug#20191)
- Invalidating the query cache caused a server crash for `INSERT INTO ... SELECT` statements that selected from a view. (Bug#20045)
- Unsigned `BIGINT` values treated as signed values by the `MOD()` function. (Bug#19955)
- Compiling PHP 5.1 with the MySQL static libraries failed on some versions of Linux. (Bug#19817)
- The `DELIMITER` statement did not work correctly when used in an SQL file run using the `SOURCE` statement. (Bug#19799)
- For a cast of a `DATETIME` value containing microseconds to `DECIMAL`, the microseconds part was truncated without generating a warning. Now the microseconds part is preserved. (Bug#19491)
- SQL statements close to the size of `max_allowed_packet` could produce binary log events larger than `max_allowed_packet` that could not be read by slave servers. (Bug#19402)
- `VARBINARY` column values inserted on a MySQL 4.1 server had trailing zeroes following upgrade to MySQL 5.0 or later. (Bug#19371)
- The server could send incorrect column count information to the client for queries that produce a larger number of columns than can fit in a two-byte number. (Bug#19216)
- For some problems relating to character set conversion or incorrect string values for `INSERT` or `UPDATE`, the server was reporting truncation or length errors instead. (Bug#18908)
- Constant expressions and some numeric constants used as input parameters to user-defined functions were not treated as constants. (Bug#18761)
- `myisampack` wrote to unallocated memory, causing a crash. (Bug#17951)
- `FLUSH LOGS` or `mysqladmin flush-logs` caused a server crash if the binary log was not open. (Bug#17733)
- `mysql_fix_privilege_tables` did not handle a password containing embedded space or apostrophe characters. (Bug#17700)
- Attempting to use a view containing `DEFINER` information for a non-existent user resulted in an error message that revealed the definer account. Now the definer is revealed only to superusers. Other users receive only an `access denied` message. (Bug#17254)
- `IN()` and `CHAR()` can return `NULL`, but did not signal that to the query processor, causing incorrect results for `IS NULL` operations. (Bug#17047)
- Slave servers would retry the execution of a SQL statement an infinite number of times, ignoring the value `SLAVE_TRANSACTION_RETRIES` when using the NDB engine. (Bug#16228)
- Warnings were generated when explicitly casting a character to a number (for example, `CAST('x' AS SIGNED)`), but not for implicit conversions in simple arithmetic operations (such as `'x' + 0`). Now warnings are generated in all cases. (Bug#11927)
- Metadata for columns calculated from scalar subqueries was limited to integer, double, or string, even if the actual type of the column was different. (Bug#11032)
- Subqueries of the form `NULL IN (SELECT ...)` returned invalid results. (Bug#8804, Bug#23485)

C.1.14. Release Notes for MySQL Enterprise 5.0.30sp1 (19 January 2007)

This is a *Service Pack* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.30).

Functionality added or changed:

- **Incompatible Change:** In MySQL 5.0.13 and up, `InnoDB` rolls back only the last statement on a transaction timeout. A new option, `--innodb_rollback_on_timeout`, causes `InnoDB` to abort and roll back the entire transaction if a transaction timeout occurs (the same behavior as before MySQL 5.0.13). (Bug #Bug#24200)

Bugs fixed:

- The loose index scan optimization for `GROUP BY` with `MIN` or `MAX` was not applied within other queries, such as `CREATE TABLE ... SELECT ...`, `INSERT ... SELECT ...`, or in the `FROM` clauses of subqueries. (Bug #Bug#24156)
- The size of `MEMORY` tables and internal temporary tables was limited to 4GB on 64-bit Windows systems. (Bug #Bug#24052)
- A stored procedure, executed from a connection using a binary character set, and which wrote multibyte data, would write incorrectly escaped entries to the binary log. This caused syntax errors, and caused replication to fail. (Bug #Bug#23619, Bug #Bug#24492)
- Accuracy was improved for comparisons between `DECIMAL` columns and numbers represented as strings. (Bug #Bug#23260)
- Calculation of `COUNT(DISTINCT)`, `AVG(DISTINCT)`, or `SUM(DISTINCT)` when they are referenced more than once in a single query with `GROUP BY` could cause a server crash. (Bug #Bug#23184)
- Evaluation of subqueries that require the filesort algorithm were allocating and freeing the `sort_buffer_size` buffer many times, resulting in slow performance. Now the buffer is allocated once and reused. (Bug #Bug#21727)
- `InnoDB` crashed while performing XA recovery of prepared transactions. (Bug #Bug#21468)
- Certain malformed `INSERT` statements could crash the `mysql` client. (Bug#21142)
- `CONCURRENT` did not work correctly for `LOAD DATA INFILE`. (Bug #Bug#20637)
- Several string functions could return incorrect results when given very large length arguments. (Bug#10963)

C.1.15. Release Notes for MySQL Enterprise 5.0.30 (14 November 2006)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.28).

Functionality added or changed:

- **MySQL Cluster:** The `ndb_config` utility now accepts `-c` as a short form of the `--ndb-connectstring` option. (Bug#22295)
- **MySQL Cluster:** Added the `--bind-address` option for `ndbd`. This allows a data node process to be bound to a specific network interface. (Bug#22195)
- **MySQL Cluster:** A potential memory leak in the `NDB` storage engine's handling of file operations was uncovered. (Bug#21858)
- **MySQL Cluster:** The `Ndb_number_of_storage_nodes` system variable was renamed to `Ndb_number_of_data_nodes`. (Bug#20848)
- **MySQL Cluster:** The `HELP` command in the Cluster management client now provides command-specific help. For example, `HELP RESTART` in `ndb_mgm` provides detailed information about the `START` command. (Bug#19620)
- If the user specified the server options `--max-connections=N` or `--table-open-cache=M`, a warning would be given in some cases that some values were recalculated, with the result that `--table-open-cache` could be assigned greater value.

It should be noted that, in such cases, both the warning and the increase in the `--table-open-cache` value were com-

pletely harmless. Note also that it is not possible for the MySQL Server to predict or to control limitations on the maximum number of open files, since this is determined by the operating system.

The recalculation code has now been fixed to ensure that the value of `--table-open-cache` is no longer increased automatically, and that a warning is now given only if some values had to be decreased due to operating system limits. (Bug#21915)

- For the `CALL` statement, stored procedures that take no arguments now can be invoked without parentheses. That is, `CALL p()` and `CALL p` are equivalent. (Bug#21462)
- `mysql_upgrade` now passes all the parameters specified on the command line to both `mysqlcheck` and `mysql` using the `upgrade_defaults` file. (Bug#20100)
- `SHOW STATUS` is no longer logged to the slow query log. (Bug#19764)
- `mysqldump --single-transaction` now uses `START TRANSACTION /*!40100 WITH CONSISTENT SNAPSHOT */` rather than `BEGIN` to start a transaction, so that a consistent snapshot will be used on those servers that support it. (Bug#19660)

Bugs fixed:

- **MySQL Cluster:** Restoring a cluster failed if there were any tables with 128 or more columns. (Bug#23502, Bug#23494)
- **MySQL Cluster:** Cluster backups would fail when there were more than 2048 schema objects in the cluster. (Bug#23499)
- **MySQL Cluster:** The management client command `ALL DUMP 1000` would cause the cluster to crash if data nodes were connected to the cluster but not yet fully started. (Bug#23203)
- **MySQL Cluster:** `INSERT ... ON DUPLICATE KEY UPDATE` on an NDB table could lead to deadlocks and memory leaks. (Bug#23200)
- **MySQL Cluster:** (NDB API): Inactivity timeouts for scans were not correctly handled. (Bug#23107)
- **MySQL Cluster:** If a node restart could not be performed from the REDO log, no node takeover took place. This could cause partitions to be left empty during a system restart. (Bug#22893)
- **MySQL Cluster:** Multiple node restarts in rapid succession could cause a system restart to fail, or induce a race condition. (Bug#22892, Bug#23210)
- **MySQL Cluster:** (NDB API): Attempting to read a nonexistent tuple using `Commit` mode for `NdbTransaction::execute()` caused node failures. (Bug#22672)
- **MySQL Cluster:** The `--help` output from NDB binaries did not include file-related options. (Bug#21994)
- **MySQL Cluster:** (NDB API): Scans closed before being executed were still placed in the send queue. (Bug#21941)
- **MySQL Cluster:** A scan timeout returned Error 4028 (NODE FAILURE CAUSED ABORT OF TRANSACTION) instead of Error 4008 (NODE FAILURE CAUSED ABORT OF TRANSACTION...). (Bug#21799)
- **MySQL Cluster:** The node recovery algorithm was missing a version check for tables in the `ALTER_TABLE_COMMITTED` state (as opposed to the `TABLE_ADD_COMMITTED` state, which has the version check). This could cause inconsistent schemas across nodes following node recovery. (Bug#21756)
- **MySQL Cluster:** The output for the `--help` option used with NDB executable programs (`ndbd`, `ndb_mgm`, `ndb_restore`, `ndb_config`, and so on) referred to the `Ndb.cfg` file, instead of `my.cnf`. (Bug#21585)
- **MySQL Cluster:** Partition distribution keys were updated only for the primary and starting replicas during node recovery. This could lead to node failure recovery for clusters having an odd number of replicas.

Note

We recommend values for `NumberOfReplicas` that are even powers of 2, for best results.

(Bug#21535)

- **MySQL Cluster:** The `ndb_mgm` management client did not set the exit status on errors, always returning 0 instead. (Bug#21530)
- **MySQL Cluster:** Attempting to create an NDB table on a MySQL with an existing non-Cluster table with the same name in the same database could result in data loss or corruption. MySQL now issues a warning when a `SHOW TABLES` or other statement

- causing table discovery finds such a table. (Bug#21378)
- **MySQL Cluster:** Cluster logs were not rotated following the first rotation cycle. (Bug#21345)
 - **MySQL Cluster:** When inserting a row into an NDB table with a duplicate value for a non-primary unique key, the error issued would reference the wrong key. (Bug#21072)
 - **MySQL Cluster:** Condition pushdown did not work correctly with DATETIME columns. (Bug#21056)
 - **MySQL Cluster:** (NDB API): The `NdbOperation::getBlobHandle()` method, when called with the name of a non-existent column, caused a segmentation fault. (Bug#21036)
 - **MySQL Cluster:** Under some circumstances, local checkpointing would hang, keeping any unstarted nodes from being started. (Bug#20895)
 - **MySQL Cluster:** Using an invalid node ID with the management client STOP command could cause `ndb_mgm` to hang. (Bug#20575)
 - **MySQL Cluster:** (NDB API): When multiple processes or threads in parallel performed the same ordered scan with exclusive lock and updating the retrieved records, the scan could skip some records, which were not updated as a result. (Bug#20446)
 - **MySQL Cluster:** Data nodes added while the cluster was running in single user mode were all assigned node ID 0, which could later cause multiple node failures. Adding of nodes in single user mode is no longer possible. (Bug#20395)
 - **MySQL Cluster:** In some cases where `SELECT COUNT(*)` from an NDB table should have yielded an error, `MAX_INT` was returned instead. (Bug#19914)
 - **MySQL Cluster:** Following the restart of an MGM node, the Cluster management client did not automatically reconnect. (Bug#19873)
 - **MySQL Cluster:** Error messages given when trying to make online changes parameters such as `NoOfReplicas` that can only be changed via a complete shutdown and restart of the cluster did not indicate the true nature of the problem. (Bug#19787)
 - **MySQL Cluster:** `ndb_restore` did not always make clear that it had recovered successfully from temporary errors while restoring a cluster backup. (Bug#19651)
 - **MySQL Cluster:** In rare situations with resource shortages, a crash could result from insufficient `IndexScanOperations`. (Bug#19198)
 - **MySQL Cluster:** `ndb_mgm -e show | head` would hang after displaying the first 10 lines of output. (Bug#19047)
 - **MySQL Cluster:** The error returned by the cluster when too many nodes were defined did not make clear the nature of the problem. (Bug#19045)
 - **MySQL Cluster:** The `ndb_config` utility did not perform host lookups correctly when using the `--host` option. (Bug#17582)
 - **MySQL Cluster:** The `ndb_config` utility did not perform host lookups correctly when using the `--host` option (Bug#17582)
 - **MySQL Cluster:** A problem with takeover during a system restart caused ordered indexes to be rebuilt incorrectly. (Bug#15303)
 - There was a race condition in the `InnoDB fil_flush_file_spaces()` function. (Bug#24089)
 - Some yaSSL-related memory leaks detected by Valgrind were fixed. (Bug#23981)
 - The internal SQL interpreter of InnoDB placed an unnecessary lock on the supremum record when `innodb_locks_unsafe_for_binlog=1`. This caused an assertion failure when InnoDB was built with debugging enabled. (Bug#23769)
 - `M % 0` returns NULL, but `(M % 0) IS NULL` evaluated to false. (Bug#23411)
 - For not-yet-authenticated connections, the `Time` column in `SHOW PROCESSLIST` was a random value rather than NULL. (Bug#23379)
 - MySQL would fail to build on the Alpha platform. (Bug#23256)
 - If `COMPRESS()` returned NULL, subsequent invocations of `COMPRESS()` within a result set or within a trigger also returned NULL. (Bug#23254)

- Insufficient memory (`myisam_sort_buffer_size`) could cause a server crash for several operations on `MyISAM` tables: repair table, create index by sort, repair by sort, parallel repair, bulk insert. (Bug#23175)
- The column default value in the output from `SHOW COLUMNS` or `SELECT FROM INFORMATION_SCHEMA.COLUMNS` was truncated to 64 characters. (Bug#23037)
- `mysql` did not check for errors when fetching data during result set printing. (Bug#22913)
- `InnoDB` exhibited thread thrashing with more than 50 concurrent connections under an update-intensive workload. (Bug#22868)
- The return value from `my_seek()` was ignored. (Bug#22828)
- The optimizer failed to use equality propagation for `BETWEEN` and `IN` predicates with string arguments. (Bug#22753)
- The `Host` column in `SHOW PROCESSLIST` output was blank when the server was started with the `--skip-grant-tables` option. (Bug#22728)
- The `Handler_rollback` status variable sometimes was incremented when no rollback had taken place. (Bug#22728)
- If a table contains an `AUTO_INCREMENT` column, inserting into an insertable view on the table that does not include the `AUTO_INCREMENT` column should not change the value of `LAST_INSERT_ID()`, because the side effects of inserting default values into columns not part of the view should not be visible. MySQL was incorrectly setting `LAST_INSERT_ID()` to zero. (Bug#22584)
- Instance Manager had a race condition involving `mysqld` PID file removal. (Bug#22379)
- The optimizer used the `ref` join type rather than `eq_ref` for a simple join on strings. (Bug#22367)
- Some queries that used `MAX()` and `GROUP BY` could incorrectly return an empty result. (Bug#22342)
- If an `init_connect` SQL statement produced an error, the connection was silently terminated with no error message. Now the server writes a warning to the error log. (Bug#22158)
- Use of `PREPARE` with a `CREATE PROCEDURE` statement that contained a syntax error caused a server crash. (Bug#21868)
- Use of a DES-encrypted SSL certificate file caused a server crash. (Bug#21868)
- Adding a day, month, or year interval to a `DATE` value produced a `DATE`, but adding a week interval produced a `DATETIME` value. Now all produce a `DATE` value. (Bug#21811)
- Use of a subquery that invoked a function in the column list of the outer query resulted in a memory leak. (Bug#21798)
- Selecting from a `MERGE` table could result in a server crash if the underlying tables had fewer indexes than the `MERGE` table itself. (Bug#21617, Bug#22937)
- After `FLUSH TABLES WITH READ LOCK` followed by `UNLOCK TABLES`, attempts to drop or alter a stored routine failed with an error that the routine did not exist, and attempts to execute the routine failed with a lock conflict error. (Bug#21414)
- For multiple-table `UPDATE` statements, storage engines were not notified of duplicate-key errors. (Bug#21381)
- Within a prepared statement, `SELECT (COUNT(*) = 1)` (or similar use of other aggregate functions) did not return the correct result for statement re-execution. (Bug#21354)
- It was possible for a stored routine with a non-`latin1` name to cause a stack overrun. (Bug#21311)
- Creating a `TEMPORARY` table with the same name as an existing table that was locked by another client could result in a lock conflict for `DROP TEMPORARY TABLE` because the server unnecessarily tried to acquire a name lock. (Bug#21096)
- Incorrect results could be obtained from re-execution of a parametrized prepared statement or a stored routine with a `SELECT` that uses `LEFT JOIN` with a second table having only one row. (Bug#21081)
- Within a stored routine, a view definition cannot refer to routine parameters or local variables. However, an error did not occur until the routine was called. Now it occurs during parsing of the routine creation statement.

Note

A side effect of this fix is that if you have already created such routines, an error will occur if you execute `SHOW CREATE PROCEDURE` or `SHOW CREATE FUNCTION`. You should drop these routines because they are erroneous.

(Bug#20953)

- In `mysql`, invoking `connect` or `\r` with very long `db_name` or `host_name` parameters caused buffer overflow. (Bug#20894)
- `SHOW VARIABLES` truncated the `Value` field to 256 characters. (Bug#20862)
- `WITH ROLLUP` could group unequal values. (Bug#20825)
- Range searches on columns with an index prefix could miss records. (Bug#20732)
- An `UPDATE` that referred to a key column in the `WHERE` clause and activated a trigger that modified the column resulted in a loop. (Bug#20670)
- `LIKE` searches failed for indexed `utf8` character columns. (Bug#20471)
- With `SQL_MODE=TRADITIONAL`, MySQL incorrectly aborted on warnings within stored routines and triggers. (Bug#20028)
- `mysqldump --xml` produced invalid XML for `BLOB` data. (Bug#19745)
- Column names were not quoted properly for replicated views. (Bug#19736)
- `FLUSH INSTANCES` in Instance Manager triggered an assertion failure. (Bug#19368)
- For a debug server, a reference to an undefined user variable in a prepared statement executed with `EXECUTE` caused an assertion failure. (Bug#19356)
- Within a trigger for a base table, selecting from a view on that base table failed. (Bug#19111)
- The value of the `warning_count` system variable was not being calculated correctly (also affecting `SHOW COUNT(*) WARNINGS`). (Bug#19024)
- `DELETE IGNORE` could hang for foreign key parent deletes. (Bug#18819)
- `InnoDB` used table locks (not row locks) within stored functions. (Bug#18077)
- `mysql` would lose its connection to the server if its standard output was not writable. (Bug#17583)
- `mysql-test-run` did not work correctly for RPM-based installations. (Bug#17194)
- A client library crash was caused by executing a statement such as `SELECT * FROM t1 PROCEDURE ANALYSE()` using a server side cursor on a table `t1` that does not have the same number of columns as the output from `PROCEDURE ANALYSE()`. (Bug#17039)
- The `WITH CHECK OPTION` for a view failed to prevent storing invalid column values for `UPDATE` statements. (Bug#16813)
- `InnoDB` showed substandard performance with multiple queries running concurrently. (Bug#15815)
- `ALTER TABLE` was not able to rename a view. (Bug#14959)
- Statements such as `DROP PROCEDURE` and `DROP VIEW` were written to the binary log too late due to a race condition. (Bug#14262)
- A literal string in a `GROUP BY` clause could be interpreted as a column name. (Bug#14019)
- Instance Manager didn't close the client socket file when starting a new `mysqld` instance. `mysqld` inherited the socket, causing clients connected to Instance Manager to hang. (Bug#12751)
- Entries in the slow query log could have an incorrect `Rows_examined` value. (Bug#12240)
- Lack of validation for input and output `TIME` values resulted in several problems: `SEC_TO_TIME()` within subqueries incorrectly clipped large values; `SEC_TO_TIME()` treated `BIGINT UNSIGNED` values as signed; only truncation warnings were produced when both truncation and out-of-range `TIME` values occurred. (Bug#11655, Bug#20927)
- A locking safety check in `InnoDB` reported a spurious error `stored_select_lock_type is 0 inside ::start_stmt()` for `INSERT ... SELECT` statements in `innodb_locks_unsafe_for_binlog` mode. The safety check was removed. (Bug#10746)
- `FROM_UNIXTIME()` did not accept arguments up to `POWER(2, 31)-1`, which it had previously. (Bug#9191)
- `OPTIMIZE TABLE` with `myisam_repair_threads > 1` could result in `MyISAM` table corruption. (Bug#8283)
- Transient errors in replication from master to slave may trigger multiple `Got fatal error 1236: 'binlog truncated in the middle of event'` errors on the slave. (Bug#4053)

C.1.16. Release Notes for MySQL Enterprise 5.0.28 (24 October 2006)

This is the first *MySQL Enterprise Server* release, following the last Community Server release (5.0.27).

Functionality added or changed:

- Binary MySQL distributions no longer include a `mysqld-max` server, except for RPM distributions. Instead, distributions contain a `mysqld` binary that includes the features previously included in the `mysqld-max` binary.

Bugs fixed:

- MySQL 5.0.26 introduced an ABI incompatibility, which this release reverts. Programs compiled against 5.0.26 are not compatible with any other version and must be recompiled. ([Bug#23427](#))
- **InnoDB**: Reduced optimization level for Windows 64 builds to handle possible memory overrun. ([Bug#19424](#))

Appendix D. MySQL Community Server Enhancements and Release Notes

This appendix lists the enhancements and changes from version to version in MySQL Community Server. This information is updated as bugs are fixed and features are incorporated, so that everybody can follow the development process.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (<http://dev.mysql.com/downloads/>), it means that the version has not yet been released (and will normally be marked so in the appropriate Release Note section).

The date mentioned with a release version is the date of the last change done internally at MySQL AB (the BitKeeper ChangeSet) on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

For information on how to determine your current version and release type, see [Section 2.2, “Determining your current MySQL version”](#).

D.1. MySQL Community Server 5.0 Enhancements and Release Notes

This section documents all enhancements, changes, and bug fixes made to MySQL Community Server from 5.0.27 on. For changes and bug fixes to earlier versions, see [Appendix E, MySQL Change History](#).

D.1.1. Release Notes for MySQL Community Server 5.0.45 (04 July 2007)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.41.

Functionality added or changed:

- **MySQL Cluster:** The server source tree now includes scripts to simplify building MySQL with SCI support. For more information about SCI interconnects and these build scripts, see [Section 16.9.1, “Configuring MySQL Cluster to use SCI Sockets”](#). ([Bug#25470](#))
- Binaries for the Linux x86 statically linked `tar.gz` Community package were linked dynamically, not statically. Static linking has been re-enabled. ([Bug#29617](#))
- Prior to this release, when `DATE` values were compared with `DATETIME` values the time portion of the `DATETIME` value was ignored. Now a `DATE` value is coerced to the `DATETIME` type by adding the time portion as “00:00:00”. To mimic the old behavior use the `CAST()` function in the following way: `SELECT date_field = CAST(NOW() as DATE);`. ([Bug#28929](#))
- A new status variable, `Com_call_procedure`, indicates the number of calls to stored procedures. ([Bug#27994](#))

Bugs fixed:

- **Security Fix:** A malformed password packet in the connection protocol could cause the server to crash. Thanks for Dormando for reporting this bug and providing details and a proof of concept. ([Bug#28984](#))
- **Security Fix:** Use of a view could allow a user to gain update privileges for tables in other databases. ([Bug#27878](#), [CVE-2007-3782](#))
- **Security Fix:** The requirement of the `DROP` privilege for `RENAME TABLE` was not being enforced. ([Bug#27515](#), [CVE-2007-2691](#))
- **Security Fix:** If a stored routine was declared using `SQL SECURITY INVOKER`, a user who invoked the routine could gain privileges. ([Bug#27337](#), [CVE-2007-2692](#))
- **Security Fix:** `CREATE TABLE LIKE` did not require any privileges on the source table. Now it requires the `SELECT` privilege.

In addition, `CREATE TABLE LIKE` was not isolated from alteration by other connections, which resulted in various errors and incorrect binary log order when trying to execute concurrently a `CREATE TABLE LIKE` statement and either DDL statements on the source table or DML or DDL statements on the target table. ([Bug#23667](#), [Bug#25578](#), [CVE-2007-3781](#))

- **Incompatible Change:** When `mysqldump` was run with the `--delete-master-logs` option, binary log files were deleted before it was known that the dump had succeeded, not after. (The method for removing log files used `RESET MASTER` prior to the dump. This also reset the binary log sequence numbering to `.000001`.) Now `mysqldump` flushes the logs (which creates a new binary log number with the next sequence number), performs the dump, and then uses `PURGE MASTER LOGS` to remove the log files older than the new one. This also preserves log numbering because the new log with the next number is generated and only the preceding logs are removed. However, this may affect applications if they rely on the log numbering sequence being reset. (Bug#24733)
- **Incompatible Change:** The use of an `ORDER BY` or `DISTINCT` clause with a query containing a call to the `GROUP_CONCAT()` function caused results from previous queries to be redisplayed in the current result. The fix for this includes replacing a `BLOB` value used internally for sorting with a `VARCHAR`. This means that for long results (more than 65,535 bytes), it is possible for truncation to occur; if so, an appropriate warning is issued. (Bug#23856, Bug#28273)
- **MySQL Cluster:** A corrupt schema file could cause a `FILE ALREADY OPEN` error. (Bug#28770)
- **MySQL Cluster:** A race condition could result when non-master nodes (in addition to the master node) tried to update active status due to a local checkpoint. Now only the master updates the active status. (Bug#28717)
- **MySQL Cluster:** A fast global checkpoint under high load with a high usage of the redo buffer caused data nodes to fail. (Bug#28653)
- **MySQL Cluster:** When an API node sent more than 1024 signals in a single batch, `NDB` would process only the first 1024 of these, and then hang. (Bug#28443)
- **MySQL Cluster:** A delay in obtaining `AUTO_INCREMENT` IDs could lead to excess temporary errors. (Bug#28410)
- **MySQL Cluster:** `INSERT IGNORE` wrongly ignored `NULL` values in unique indexes. (Bug#27980)
- **MySQL Cluster:** The name of the month “March” was given incorrectly in the cluster error log. (Bug#27926)
- **MySQL Cluster:** It was not possible to add a unique index to an `NDB` table while in single user mode. (Bug#27710)
- **MySQL Cluster:** Repeated insertion of data generated by `mysqldump` into `NDB` tables could eventually lead to failure of the cluster. (Bug#27437)
- **MySQL Cluster:** (APIs): For `BLOB` reads on operations with lock mode `LM_CommittedRead`, the lock mode was not upgraded to `LM_Read` before the state of the `BLOB` had already been calculated. The `NDB` API methods affected by this problem included the following:
 - `NdbOperation::readTuple()`
 - `NdbScanOperation::readTuples()`
 - `NdbIndexScanOperation::readTuples()`
(Bug#27320)
- **MySQL Cluster:** `ndb_connectstring` did not appear in the output of `SHOW VARIABLES`. (Bug#26675)
- **MySQL Cluster:** A failure to release internal resources following an error could lead to problems with single user mode. (Bug#25818)
- On the IBM i5 platform, the installation script in *SAVF binaries unconditionally executed the `mysql_install_db` script. This problem was fixed in a repackaged distribution numbered 5.0.45b. (Bug#30084)
- Long pathnames for internal temporary tables could cause stack overflows. (Bug#29015)
- Using an `INTEGER` column from a table to `ROUND()` a number produced different results than using a constant with the same value as the `INTEGER` column. (Bug#28980)
- If a program binds a given number of parameters to a prepared statement handle and then somehow changes `stmt->param_count` to a different number, `mysql_stmt_execute()` could crash the client or server. (Bug#28934)
- `INSERT .. ON DUPLICATE KEY UPDATE` could under some circumstances silently update rows when it should not have. (Bug#28904)
- Queries that used `UUID()` were incorrectly allowed into the query cache. (This should not happen because `UUID()` is non-deterministic.) (Bug#28897)
- Using a `VIEW` created with a non-existing `DEFINER` could lead to incorrect results under some circumstances. (Bug#28895)
- InnoDB tables using an indexed `CHAR` column with `utf8` as the default character set could fail to return the right rows.

[Bug#28878](#))

- On Windows, `USE_TLS` was not defined for `mysqlclient.lib`. ([Bug#28860](#))
- A subquery with `ORDER BY` and `LIMIT 1` could cause a server crash. ([Bug#28811](#))
- Using `BETWEEN` with non-indexed date columns and short formats of the date string could return incorrect results. ([Bug#28778](#))
- Selecting `GEOMETRY` columns in a `UNION` caused a server crash. ([Bug#28763](#))
- When constructing the path to the original `.frm` file, `ALTER ... RENAME` was unnecessarily (and incorrectly) lowercasing the entire path when not on a case-insensitive filesystem, causing the statement to fail. ([Bug#28754](#))
- The actual value of `MaxNoOfOpenFiles` as used by the cluster was offset by 1 from the value set in `config.ini`. This meant that setting `InitialNoOpenFiles` to the same value always caused an error. ([Bug#28749](#))
- Searches on indexed and non-indexed `ENUM` columns could return different results for empty strings. ([Bug#28729](#))
- Executing `EXPLAIN EXTENDED` on a query using a derived table over a grouping subselect could lead to a server crash. This occurred only when materialization of the derived tables required creation of an auxiliary temporary table, an example being when a grouping operation was carried out with usage of a temporary table. ([Bug#28728](#))
- `UPDATE IGNORE` statements involving the primary keys of multiple tables could result in data corruption. ([Bug#28719](#))
- The result of evaluation for a view's `CHECK OPTION` option over an updated record and records of merged tables was arbitrary and dependant on the order of records in the merged tables during the execution of the `SELECT` statement. ([Bug#28716](#))
- The “manager thread” of the LinuxThreads implementation was unintentionally started before `mysqld` had dropped privileges (to run as an unprivileged user). This caused signaling between threads in `mysqld` to fail when the privileges were finally dropped. ([Bug#28690](#))
- For debug builds, `ALTER TABLE` could trigger an assertion failure due to occurrence of a deadlock when committing changes. ([Bug#28652](#))
- After an upgrade, the names of stored routines referenced by views were no longer displayed by `SHOW CREATE VIEW`. ([Bug#28605](#))

This regression was introduced by [Bug#23491](#)

- Killing from one connection a long-running `EXPLAIN QUERY` started from another connection caused `mysqld` to crash. ([Bug#28598](#))
- Outer join queries with `ON` conditions over constant outer tables did not return `NULL`-complemented rows when conditions were evaluated to `FALSE`. ([Bug#28571](#))
- An update on a multiple-table view with the `CHECK OPTION` clause and a subquery in the `WHERE` condition could cause an assertion failure. ([Bug#28561](#))
- `PURGE MASTER LOGS BEFORE (subquery)` caused a server crash. Subqueries are forbidden in the `BEFORE` clause now. ([Bug#28553](#))
- `mysqldump` calculated the required memory for a hex-blob string incorrectly causing a buffer overrun. This in turn caused `mysqldump` to crash silently and produce incomplete output. ([Bug#28522](#))
- Passing a `DECIMAL` value as a parameter of a statement prepared with `PREPARE` resulted in an error. ([Bug#28509](#))
- `mysql_affected_rows()` could return an incorrect result for `INSERT ... ON DUPLICATE KEY UPDATE` if the `CLIENT_FOUND_ROWS` flag was set. ([Bug#28505](#))
- A query that grouped by the result of an expression returned a different result when the expression was assigned to a user variable. ([Bug#28494](#))
- Subselects returning `LONG` values in MySQL versions later than 5.0.24a returned `LONGLONG` prior to this. The previous behavior was restored. ([Bug#28492](#))

This regression was introduced by [Bug#19714](#)

- Forcing the use of an index on a `SELECT` query when the index had been disabled would raise an error without running the query. The query now executes, with a warning generated noting that the use of a disabled index has been ignored. ([Bug#28476](#))

- The result of executing of a prepared statement created with `PREPARE s FROM "SELECT 1 LIMIT ?"` was not replicated correctly. (Bug#28464)
- The query `SELECT '2007-01-01' + INTERVAL column_name DAY FROM table_name` caused `mysqld` to fail. (Bug#28450)
- A server crash could happen under rare conditions such that a temporary table outgrew heap memory reserved for it and the remaining disk space was not big enough to store the table as a `MyISAM` table. (Bug#28449)
- `mysql_upgrade` failed if certain SQL modes were set. Now it sets the mode itself to avoid this problem. (Bug#28401)
- A query with a `NOT IN` subquery predicate could cause a crash when the left operand of the predicate evaluated to `NULL`. (Bug#28375)
- The test case for `mysqldump` failed with `bin-log` disabled. (Bug#28372)
- Attempting to `LOAD_FILE` from an empty floppy drive under Windows, caused the server to hang. For example, if you opened a connection to the server and then issued the command `SELECT LOAD_FILE('a:test');`, with no floppy in the drive, the server was inaccessible until the modal pop-up dialog box was dismissed. (Bug#28366)
- A buffer overflow could occur when using `DECIMAL` columns on Windows operating systems. (Bug#28361)
- `libmysql.dll` could not be dynamically loaded on Windows. (Bug#28358)
- Grouping queries with correlated subqueries in `WHERE` conditions could produce incorrect results. (Bug#28337)
- `mysqltest` used a too-large stack size on PPC/Debian Linux, causing thread-creation failure for tests that use many threads. (Bug#28333)
- `EXPLAIN` for a query on an empty table immediately after its creation could result in a server crash. (Bug#28272)
- The `IS_UPDATABLE` column in the `INFORMATION_SCHEMA.VIEWS` table was not always set correctly. (Bug#28266)
- Comparing a `DATETIME` column value with a user variable yielded incorrect results. (Bug#28261)
- For `CAST()` of a `NULL` value with type `DECIMAL`, the return value was incorrectly initialized, producing a runtime error for binaries built using Visual C++ 2005. (Bug#28250)
- Recreating a view that already exists on the master would cause a replicating slave to terminate replication with a 'different error message on slave and master' error. (Bug#28244)
- Portability problems caused by use of `isinf()` were corrected. (Bug#28240)
- When dumping procedures, `mysqldump --compact` generated output that restored the session variable `SQL_MODE` without first capturing it. When dumping routines, `mysqldump --compact` neither set nor retrieved the value of `SQL_MODE`. (Bug#28223)
- Comparison of the string value of a date showed as unequal to `CURTIME()`. Similar behavior was exhibited for `DATETIME` values. (Bug#28208)
- For `InnoDB`, in some rare cases the optimizer preferred a more expensive `ref` access to a less expensive range access. (Bug#28189)
- A performance degradation was observed for outer join queries to which a not-exists optimization was applied. (Bug#28188)
- `SELECT * INTO OUTFILE ... FROM INFORMATION_SCHEMA.schemata` failed with an `Access denied` error, even for a user who has the `FILE` privilege. (Bug#28181)
- The `Bytes_received` and `Bytes_sent` status variables could hold only 32-bit values (not 64-bit values) on some platforms. (Bug#28149)
- Comparisons of `DATE` or `DATETIME` values for the `IN()` function could yield incorrect results. (Bug#28133)
- Storing a large number into a `FLOAT` or `DOUBLE` column with a fixed length could result in incorrect truncation of the number if the column's length was greater than 31. (Bug#28121)
- The cluster waited 30 seconds instead of 30 milliseconds before reading table statistics. (Bug#28093)
- The server could hang for `INSERT IGNORE ... ON DUPLICATE KEY UPDATE` if an update failed. (Bug#28000)
- The `BLACKHOLE` storage engine does not support `INSERT DELAYED` statements, but they were not being rejected.

[Bug#27998](#))

- `DECIMAL` values beginning with nine 9 digits could be incorrectly rounded. ([Bug#27984](#))
- `CAST()` to `DECIMAL` did not check for overflow. ([Bug#27957](#))
- For `INSERT ... ON DUPLICATE KEY UPDATE` statements that affected many rows, updates could be applied to the wrong rows. ([Bug#27954](#))
- Early `NULL`-filtering optimization did not work for `eq_ref` table access. ([Bug#27939](#))
- The second execution of a prepared statement from a `UNION` query with `ORDER BY RAND()` caused the server to crash. This problem could also occur when invoking a stored procedure containing such a query. ([Bug#27937](#))
- Views ignored precision for `CAST()` operations. ([Bug#27921](#))
- For attempts to open a non-existent table, the server should report `ER_NO_SUCH_TABLE` but sometimes reported `ER_TABLE_NOT_LOCKED`. ([Bug#27907](#))
- A stored program that uses a variable name containing multibyte characters could fail to execute. ([Bug#27876](#))
- Non-grouped columns were allowed by `*` in `ONLY_FULL_GROUP_BY` SQL mode. ([Bug#27874](#))
- `ON` conditions from `JOIN` expressions were ignored when checking the `CHECK OPTION` clause while updating a multiple-table view that included such a clause. ([Bug#27827](#))
- Debug builds on Windows generated false alarms about uninitialized variables with some Visual Studio runtime libraries. ([Bug#27811](#))
- Certain queries that used uncorrelated scalar subqueries caused `EXPLAIN` to crash. ([Bug#27807](#))
- Changes to some system variables should invalidate statements in the query cache, but invalidation did not happen. ([Bug#27792](#))
- Performing a `UNION` on two views that had had `ORDER BY` clauses resulted in an `Unknown column` error. ([Bug#27786](#))
- `mysql_install_db` is supposed to detect existing system tables and create only those that do not exist. Instead, it was exiting with an error if tables already existed. ([Bug#27783](#))
- On some systems, `udf_example.c` returned an incorrect result length. Also on some systems, `mysql-test-run.pl` could not find the shared object built from `udf_example.c`. ([Bug#27741](#))
- `mysqld` did not check the length of option values and could crash with a buffer overflow for long values. ([Bug#27715](#))
- Comparisons using row constructors could fail for rows containing `NULL` values. ([Bug#27704](#))
- `LOAD DATA` did not use `CURRENT_TIMESTAMP` as the default value for a `TIMESTAMP` column for which no value was provided. ([Bug#27670](#))
- `mysqldump` could not connect using SSL. ([Bug#27669](#))
- On Linux, the server could not create temporary tables if `lower_case_table_names` was set to 1 and the value of `tmpdir` was a directory name containing any uppercase letters. ([Bug#27653](#))
- For InnoDB tables, a multiple-row `INSERT` of the form `INSERT INTO t (id...) VALUES (NULL...) ON DUPLICATE KEY UPDATE id=VALUES(id)`, where `id` is an `AUTO_INCREMENT` column, could cause `ERROR 1062 (23000): Duplicate entry...` errors or lost rows. ([Bug#27650](#))
- `HASH` indexes on `VARCHAR` columns with binary collations did not ignore trailing spaces from strings before comparisons. This could result in duplicate records being successfully inserted into a `MEMORY` table with unique key constraints. A consequence was that internal `MEMORY` tables used for `GROUP BY` calculation contained duplicate rows that resulted in duplicate-key errors when converting those temporary tables to `MyISAM`, and that error was incorrectly reported as a `table is full` error. ([Bug#27643](#))
- The XML output representing an empty result was an empty string rather than an empty `<resultset/>` element. ([Bug#27608](#))
- An error occurred trying to connect to `mysqld-debug.exe`. ([Bug#27597](#))
- Comparison of a `DATE` with a `DATETIME` did not treat the `DATE` as having a time part of `00:00:00`. ([Bug#27590](#))

- Selecting `MIN()` on an indexed column that contained only `NULL` values caused `NULL` to be returned for other result columns. (Bug#27573)
- If a stored function or trigger was killed, it aborted but no error was thrown, allowing the calling statement to continue without noticing the problem. This could lead to incorrect results. (Bug#27563)
- The fix for Bug#17212 provided correct sort order for misordered output of certain queries, but caused significant overall query performance degradation. (Results were correct (good), but returned much more slowly (bad).) The fix also affected performance of queries for which results were correct. The performance degradation has been addressed. (Bug#27531)
- The `CRC32()` function returns an unsigned integer, but the metadata was signed, which could cause certain queries to return incorrect results. (For example, queries that selected a `CRC32()` value and used that value in the `GROUP BY` clause.) (Bug#27530)
- An interaction between `SHOW TABLE STATUS` and other concurrent statements that modify the table could result in a divide-by-zero error and a server crash. (Bug#27516)
- When `ALTER TABLE` was used to add a new `DATE` column with no explicit default value, `'0000-00-00'` was used as the default even if the SQL mode included the `NO_ZERO_DATE` mode to prohibit that value. A similar problem occurred for `DATETIME` columns. (Bug#27507)
- A race condition between `DROP TABLE` and `SHOW TABLE STATUS` could cause the latter to display incorrect information. (Bug#27499)
- Using a `TEXT` local variable in a stored routine in an expression such as `SET var = SUBSTRING(var, 3)` produced an incorrect result. (Bug#27415)
- Nested aggregate functions could be improperly evaluated. (Bug#27363)
- A stored function invocation in the `WHERE` clause was treated as a constant. (Bug#27354)
- Failure to allocate memory associated with `transaction_prealloc_size` could cause a server crash. (Bug#27322)
- `mysqldump` crashed if it got no data from `SHOW CREATE PROCEDURE` (for example, when trying to dump a routine defined by a different user and for which the current user had no privileges). Now it prints a comment to indicate the problem. It also returns an error, or continues if the `--force` option is given. (Bug#27293)
- The error message for error number 137 did not report which database/table combination reported the problem. (Bug#27173)
- `mysqlbinlog` produced different output with the `-R` option than without it. (Bug#27171)
- A large filesort could result in a division by zero error and a server crash. (Bug#27119)
- Times displayed by `SHOW PROFILE` were incorrectly associated with the profile entry one later than the correct one. (Bug#27060)
- Flow control optimization in stored routines could cause exception handlers to never return or execute incorrect logic. (Bug#26977)
- `SHOW PROFILE` hung if executed before enabling the `@@profiling` session variable. (Bug#26938)
- Binary logging of prepared statements could produce syntactically incorrect queries in the binary log, replacing some parameters with variable names rather than variable values. This could lead to incorrect results on replication slaves. (Bug#26842, Bug#12826)
- `mysqldump` would not dump a view for which the `DEFINER` no longer exists. (Bug#26817)
- Connections from one `mysqld` server to another failed on Mac OS X, affecting replication and `FEDERATED` tables. (Bug#26664)
- Creating a temporary table with InnoDB when using the one-file-per-table setting, when the host filesystem for temporary tables is `tmpfs` would cause an assertion within `mysqld`. This was due to the use of `O_DIRECT` when opening the temporary table file. (Bug#26662)
- `mysql_upgrade` did not detect failure of external commands that it runs. (Bug#26639)
- Some test suite files were missing from some MySQL-test packages. (Bug#26609)
- Aborting a statement on the master that applied to a non-transactional statement broke replication. The statement was written to the binary log but not completely executed on the master. Slaves receiving the statement executed it completely, resulting in loss of data synchrony. Now an error code is written to the error log so that the slaves stop without executing the aborted state-

ment. (That is, replication stops, but synchrony to the point of the stop is preserved and you can investigate the problem.) (Bug#26551)

- Statements within triggers ignored the value of the `low_priority_updates` system variable. (Bug#26162)
- Index hints (`USE INDEX`, `IGNORE INDEX`, `FORCE INDEX`) cannot be used with `FULLTEXT` indexes, but were not being ignored. (Bug#25951)
- If `CREATE TABLE t1 LIKE t2` failed due to a full disk, an empty `t2.frm` file could be created but not removed. This file then caused subsequent attempts to create a table named `t2` to fail. This is easily corrected at the filesystem level by removing the `t2.frm` file manually, but now the server removes the file if the create operation does not complete successfully. (Bug#25761)
- Running `CHECK TABLE` concurrently with a `SELECT`, `INSERT` or other statement on Windows could corrupt a MyISAM table. (Bug#25712)
- On Windows, connection handlers did not properly decrement the server's thread count when exiting. (Bug#25621)
- `mysql_upgrade` did not pass a password to `mysqlcheck` if one was given. (Bug#25452)
- On Windows, `mysql_upgrade` was sensitive to lettercase of the names of some required components. (Bug#25405)
- For storage engines that allow the current auto-increment value to be set, using `ALTER TABLE ... ENGINE` to convert a table from one such storage engine to another caused loss of the current value. (For storage engines that do not support setting the value, it cannot be retained anyway when changing the storage engine.) (Bug#25262)
- Restoration of the default database after stored routine or trigger execution on a slave could cause replication to stop if the database no longer existed. (Bug#25082)
- Due to a race condition, executing `FLUSH PRIVILEGES` in one thread could cause brief table unavailability in other threads. (Bug#24988)
- Several math functions produced incorrect results for large unsigned values. `ROUND()` produced incorrect results or a crash for a large number-of-decimals argument. (Bug#24912)
- The result set of a query that used `WITH ROLLUP` and `DISTINCT` could lack some rollup rows (rows with `NULL` values for grouping attributes) if the `GROUP BY` list contained constant expressions. (Bug#24856)
- Potential memory leaks in the `SHOW PROFILE` implementation were eliminated. (Bug#24795)
- For queries that used `ORDER BY` with InnoDB tables, if the optimizer chose an index for accessing the table but found a covering index that enabled the `ORDER BY` to be skipped, no results were returned. (Bug#24778)
- Concurrent execution of `CREATE TABLE ... SELECT` and other statements involving the target table suffered from various race conditions, some of which might have led to deadlocks. (Bug#24738)
- On some Linux distributions where LinuxThreads and NPTL `glibc` versions both are available, statically built binaries can crash because the linker defaults to LinuxThreads when linking statically, but calls to external libraries (such as `libnss`) are resolved to NPTL versions. This cannot be worked around in the code, so instead if a crash occurs on such a binary/OS combination, print an error message that provides advice about how to fix the problem. (Bug#24611)
- An attempt to execute `CREATE TABLE ... SELECT` when a temporary table with the same name already existed led to the insertion of data into the temporary table and creation of an empty non-temporary table. (Bug#24508)
- The `MERGE` storage engine could return incorrect results when several index values that compare equality were present in an index (for example, `'gross'` and `'gross '`, which are considered equal but have different lengths). (Bug#24342)
- Some upgrade problems are detected and better error messages suggesting that `mysql_upgrade` be run are produced. (Bug#24248)
- Some views could not be created even when the user had the requisite privileges. (Bug#24040)
- Using `CAST()` to convert `DATETIME` values to numeric values did not work. (Bug#23656)
- The `AUTO_INCREMENT` value would not be correctly reported for InnoDB tables when using `SHOW CREATE TABLE` statement or `mysqldump` command. (Bug#23313)
- Implicit conversion of `9912101` to `DATE` did not match `CAST(9912101 AS DATE)`. (Bug#23093)
- Conversion errors could occur when constructing the condition for an `IN` predicate. The predicate was treated as if the affected column contains `NULL`, but if the `IN` predicate is inside `NOT`, incorrect results could be returned. (Bug#22855)

- `SELECT COUNT(*)` from a table containing a `DATETIME NOT NULL` column could produce spurious warnings with the `NO_ZERO_DATE` SQL mode enabled. (Bug#22824)
- When using transactions and replication, shutting down the master in the middle of a transaction would cause all slaves to stop replicating. (Bug#22725)
- Using `SET GLOBAL` to change the `lc_time_names` system variable had no effect on new connections. (Bug#22648)
- A multiple-table `UPDATE` could return an incorrect rows-matched value if, during insertion of rows into a temporary table, the table had to be converted from a `MEMORY` table to a `MyISAM` table. (Bug#22364)
- `yaSSL` crashed on pre-Pentium Intel CPUs. (Bug#21765)
- Linux binaries were unable to dump core after executing a `setuid()` call. (Bug#21723)
- A slave that used `--master-ssl-cipher` could not connect to the master. (Bug#21611)
- Quoted labels in stored routines were mishandled, rendering the routines unusable. (Bug#21513)
- The server could abort or deadlock for `INSERT DELAYED` statements for which another insert was performed implicitly (for example, via a stored function that inserted a row). (Bug#21483)
- Stack overflow caused server crashes. (Bug#21476)
- `CURDATE()` is less than `NOW()`, either when comparing `CURDATE()` directly (`CURDATE() < NOW()` is true) or when casting `CURDATE()` to `DATE` (`CAST(CURDATE() AS DATE) < NOW()` is true). However, storing `CURDATE()` in a `DATE` column and comparing `col_name < NOW()` incorrectly yielded false. This is fixed by comparing a `DATE` column as `DATETIME` for comparisons to a `DATETIME` constant. (Bug#21103)
- `CREATE TABLE IF NOT EXISTS ... SELECT` caused a server crash if the target table already existed and had a `BEFORE INSERT` trigger. (Bug#20903)
- Deadlock occurred for attempts to execute `CREATE TABLE IF NOT EXISTS ... SELECT` when `LOCK TABLES` had been used to acquire a read lock on the target table. (Bug#20662)
- Changing a `utf8` column in an `InnoDB` table to a shorter length did not shorten the data values. (Bug#20095)
- For dates with 4-digit year parts less than 200, an incorrect implicit conversion to add a century was applied for date arithmetic performed with `DATE_ADD()`, `DATE_SUB()`, `+ INTERVAL`, and `- INTERVAL`. (For example, `DATE_ADD('0050-01-01 00:00:00', INTERVAL 0 SECOND)` became `'2050-01-01 00:00:00'`.) (Bug#18997)
- Using `CREATE TABLE LIKE ...` would raise an assertion when replicated to a slave. (Bug#18950)
- Granting access privileges to an individual table where the database or table name contained an underscore would fail. (Bug#18660)
- The `-lmtmalloc` library was removed from the output of `mysql_config` on Solaris, as it caused problems when building `DBD:mysql` (and possibly other applications) on that platform that tried to use `dlopen()` to access the client library. (Bug#18322)
- The `check-cpu` script failed to detect AMD64 Turion processors correctly. (Bug#17707)
- Trying to shut down the server following a failed `LOAD DATA INFILE` caused `mysqld` to crash. (Bug#17233)
- The omission of leading zeros in dates could lead to erroneous results when these were compared with the output of certain date and time functions. (Bug#16377)
- `INSERT...ON DUPLICATE KEY UPDATE` could cause `Error 1032: Can't find record in ...` for inserts into an `InnoDB` table unique index using key column prefixes with an underlying `utf8` string column. (Bug#13191)
- Using up-arrow for command-line recall in `mysql*` could cause a segmentation fault. (Bug#10218)
- Having the `EXECUTE` privilege for a routine in a database should make it possible to `USE` that database, but the server returned an error instead. This has been corrected. As a result of the change, `SHOW TABLES` for a database in which you have only the `EXECUTE` privilege returns an empty set rather than an error. (Bug#9504)
- The result for `CAST()` when casting a value to `UNSIGNED` was limited to the maximum signed `BIGINT` value, not the maximum unsigned value. (Bug#8663)

D.1.2. Release Notes for MySQL Community Server 5.0.41 (01 May 2007)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.37.

Functionality added or changed:

- **MySQL Cluster:** Several options have been added for use with `ndb_restore --print_data` to facilitate the creation of data dump files. (Bug#26900)
- If a set function *S* with an outer reference *S(outer_ref)* cannot be aggregated in the outer query against which the outer reference has been resolved, MySQL interprets *S(outer_ref)* the same way that it would interpret *S(const)*. However, standard SQL requires throwing an error in this situation. An error now is thrown for such queries if the ANSI SQL mode is enabled. (Bug#27348)
- It is now possible to restore selected databases or tables using `ndb_restore`. (Bug#26899)
- Prefix lengths for columns in `SPATIAL` indexes are no longer displayed in `SHOW CREATE TABLE` output. `mysqldump` uses that statement, so if a table with `SPATIAL` indexes containing prefixed columns is dumped and reloaded, the index is created with no prefixes. (The full column width of each column is indexed.) (Bug#26794)
- The output of `mysql --xml` and `mysqldump --xml` now includes a valid XML namespace. (Bug#25946)
- If you use SSL for a client connection, you can tell the client not to authenticate the server certificate by specifying neither `--ssl-ca` nor `--ssl-capath`. The server still verifies the client according to any applicable requirements established via `GRANT` statements for the client, and it still uses any `--ssl-ca/--ssl-capath` values that were passed to server at startup time. (Bug#25309)
- The server now includes a timestamp in error messages that are logged as a result of unhandled signals (such as `mysqld got signal 11` messages). (Bug#24878)
- The syntax for index hints has been extended to enable explicit specification that the hint applies only to join processing. See Section 12.2.7.2, "Index Hint Syntax". (Bug#21174)
- Added the `--secure-file-priv` option for `mysql-test-run.pl`, which limits the effect of the `load_file` command for `mysqltest` and for the `LOAD DATA` and `SELECT ... INTO OUTFILE` statements to work with files in a given directory. (Bug#18628)
- Binary distributions for some platforms did not include shared libraries; now shared libraries are shipped for all platforms except AIX 5.2 64-bit. (Bug#16520, Bug#26767, Bug#13450)
- Added the `hostname` system variable, which the server sets at startup to the server hostname.
- The `mysql_create_system_tables` script was removed because `mysql_install_db` no longer uses it in MySQL 5.0.
- To satisfy different user requirements, we provide several servers. `mysqld` is an optimized server that is a smaller, faster binary. Each package now also includes `mysqld-debug`, which is compiled with debugging support but is otherwise configured identically to the non-debug server.

Bugs fixed:

- **Incompatible Change:** `INSERT DELAYED` statements are not supported for `MERGE` tables, but the `MERGE` storage engine was not rejecting such statements, resulting in table corruption. Applications previously using `INSERT DELAYED` into `MERGE` table will break when upgrading to versions with this fix. To avoid the problem, remove `DELAYED` from such statements. (Bug#26464)
- **MySQL Cluster:** `NDB` tables having `MEDIUMINT AUTO_INCREMENT` columns were not restored correctly by `ndb_restore`, causing spurious duplicate key errors. This issue did not affect `TINYINT`, `INT`, or `BIGINT` columns with `AUTO_INCREMENT`. (Bug#27775)
- **MySQL Cluster:** `NDB` tables with indexes whose names contained space characters were not restored correctly by `ndb_restore` (the index names were truncated). (Bug#27758)
- **MySQL Cluster:** Some queries that updated multiple tables were not backed up correctly. (Bug#27748)
- **MySQL Cluster:** Memory usage of a `mysqld` process grew even while idle. (Bug#27560)
- **MySQL Cluster:** It was not possible to set `LockPagesInMainMemory` equal to 0. (Bug#27291)

- **MySQL Cluster:** Error messages displayed when running in single user mode were inconsistent. ([Bug#27021](#))
- **MySQL Cluster:** (APIs): Using `NdbBlob::writeData()` to write data in the middle of an existing blob value (that is, updating the value) could overwrite some data past the end of the data to be changed. ([Bug#27018](#))
- **MySQL Cluster:** The failure of a data node while restarting could cause other data nodes to hang or crash. ([Bug#27003](#))
- **MySQL Cluster:** On Solaris, the value of an NDB table column declared as `BIT(33)` was always displayed as 0. ([Bug#26986](#))
- **MySQL Cluster:** The output from `ndb_restore --print_data` was incorrect for a backup made of a database containing tables with `TINYINT` or `SMALLINT` columns. ([Bug#26740](#))
- **MySQL Cluster:** An inadvertent use of unaligned data caused `ndb_restore` to fail on some 64-bit platforms, including Sparc and Itanium-2. ([Bug#26739](#))
- **MySQL Cluster:** An invalid pointer was returned following a `FSCLOSECONF` signal when accessing the REDO logs during a node restart or system restart. ([Bug#26515](#))
- **MySQL Cluster:** The failure of a data node when restarting it with `--initial` could lead to failures of subsequent data node restarts. ([Bug#26481](#))
- **MySQL Cluster:** Takeover for local checkpointing due to multiple failures of master nodes was sometimes incorrectly handled. ([Bug#26457](#))
- **MySQL Cluster:** The `LockPagesInMemory` parameter was not read until after distributed communication had already started between cluster nodes. When the value of this parameter was 1, this could sometimes result in data node failure due to missed heartbeats. ([Bug#26454](#))
- **MySQL Cluster:** Under some circumstances, following the restart of a management, all cluster data nodes would connect to it normally, but some of them subsequently failed to log any events to the management node. ([Bug#26293](#))
- **MySQL Cluster:** In some cases, `AFTER UPDATE` and `AFTER DELETE` triggers on NDB tables that referenced subject table did not see the results of operation which caused invocation of the trigger, but rather saw the row as it was prior to the update or delete operation.

This was most noticeable when an update operation used a subquery to obtain the rows to be updated. An example would be `UPDATE tbl1 SET col2 = val1 WHERE tbl1.col1 IN (SELECT col3 FROM tbl2 WHERE col4 = val2)` where there was an `AFTER UPDATE` trigger on table `tbl1`. In such cases, the trigger would fail to execute.

The problem occurred because the actual update or delete operations were deferred to be able to perform them later as one batch. The fix for this bug solves the problem by disabling this optimization for a given update or delete if the table has an `AFTER` trigger defined for this operation. ([Bug#26242](#))

- **MySQL Cluster:** Condition pushdown did not work with prepared statements. ([Bug#26225](#))
- **MySQL Cluster:** Joins on multiple tables containing `BLOB` columns could cause data nodes run out of memory, and to crash with the error `NDBOBJECTIDMAP: :EXPAND UNABLE TO EXPAND`. ([Bug#26176](#))
- **MySQL Cluster:** After entering single user mode it was not possible to alter non-NDB tables on any SQL nodes other than the one having sole access to the cluster. ([Bug#25275](#))
- **MySQL Cluster:** The management client command `node_id STATUS` displayed the message `Node node_id: not connected` when `node_id` was not the node ID of a data node.

Note

The `ALL STATUS` command in the cluster management client still displays status information for data nodes only. This is by design. See [Section 16.6.2, “Commands in the MySQL Cluster Management Client”](#), for more information.

([Bug#21715](#))

- **MySQL Cluster:** An error was produced when `SHOW TABLE STATUS` was used on an NDB table that had no `AUTO_INCREMENT` column. ([Bug#21033](#))
- **MySQL Cluster:** Some values of `MaxNoOfTables` caused the error `JOB BUFFER CONGESTION` to occur. ([Bug#19378](#))
- Some equi-joins containing a `WHERE` clause that included a `NOT IN` subquery caused a server crash. ([Bug#27870](#))
- `SELECT DISTINCT` could return incorrect results if the select list contained duplicated columns. ([Bug#27659](#))

- With `NO_AUTO_VALUE_ON_ZERO` SQL mode enabled, `LOAD DATA` operations could assign incorrect `AUTO_INCREMENT` values. (Bug#27586)
- Under certain rare circumstances, `DROP TABLE` or `TRUNCATE` of an `NDB` table could cause a node failure or forced cluster shutdown. (Bug#27581)
- Incorrect results could be returned for some queries that contained a select list expression with `IN` or `BETWEEN` together with an `ORDER BY` or `GROUP BY` on the same expression using `NOT IN` or `NOT BETWEEN`. (Bug#27532)
- Evaluation of an `IN()` predicate containing a decimal-valued argument caused a server crash. (Bug#27513, Bug#27362, CVE-2007-2583)
- Profiling overhead was incurred even with profiling disabled. (Bug#27501)
- In out-of-memory conditions, the server might crash or otherwise not report an error to the Windows event log. (Bug#27490)
- Passing nested row expressions with different structures to an `IN` predicate caused a server crash. (Bug#27484)
- The `decimal.h` header file was incorrectly omitted from binary distributions. (Bug#27456)
- With `innodb_file_per_table` enabled, attempting to rename an `InnoDB` table to a non-existent database caused the server to exit. (Bug#27381)
- A subquery could get incorrect values for references to outer query columns when it contained aggregate functions that were aggregated in outer context. (Bug#27321)
- In a view, a column that was defined using a `GEOMETRY` function was treated as having the `LONGBLOB` data type rather than the `GEOMETRY` type. (Bug#27300)
- A race condition could sometimes occur if the node acting as master failed while node IDs were still being allocated during startup. (Bug#27286)
- When a data node was taking over as the master node, a race condition could sometimes occur as the node was assuming responsibility for handling of global checkpoints. (Bug#27283)
- Queries containing subqueries with `COUNT(*)` aggregated in an outer context returned incorrect results. This happened only if the subquery did not contain any references to outer columns. (Bug#27257)
- `SELECT ... INTO OUTFILE` with a long `FIELDS ENCLOSED BY` value could crash the server. (Bug#27231)
- Use of an aggregate function from an outer context as an argument to `GROUP_CONCAT()` caused a server crash. (Bug#27229)
- String truncation upon insertion into an integer or year column did not generate a warning (or an error in strict mode). (Bug#27176, Bug#26359)
- Storing `NULL` values in spatial fields caused excessive memory allocation and crashes on some systems. (Bug#27164)
- Row equalities in `WHERE` clauses could cause memory corruption. (Bug#27154)
- `GROUP BY` on a `ucs2` column caused a server crash when there was at least one empty string in the column. (Bug#27079)
- Duplicate members in `SET` definitions were not detected. Now they result in a warning; if strict SQL mode is enabled, an error occurs instead. (Bug#27069)
- For `INSERT ... ON DUPLICATE KEY UPDATE` statements on tables containing `AUTO_INCREMENT` columns, `LAST_INSERT_ID()` was reset to 0 if no rows were successfully inserted or changed. “Not changed” includes the case where a row was updated to its current values, but in that case, `LAST_INSERT_ID()` should not be reset to 0. Now `LAST_INSERT_ID()` is reset to 0 only if no rows were successfully inserted or touched, whether or not touched rows were changed. (Bug#27033)

This regression was introduced by Bug#19978

- `mysql_install_db` could terminate with an error after failing to determine that a system table already existed. (Bug#27022)
- `AFTER UPDATE` triggers were not activated by the update part of `INSERT ... ON DUPLICATE KEY UPDATE` statements. (Bug#27006, Bug#27210)

This regression was introduced by Bug#19978

- In a `MEMORY` table, using a `BTREE` index to scan for updatable rows could lead to an infinite loop. (Bug#26996)

- Invalid optimization of pushdown conditions for queries where an outer join was guaranteed to read only one row from the outer table led to results with too few rows. (Bug#26963)
- Windows binaries contained no debug symbol file. Now `.map` and `.pdb` files are included in 32-bit builds for `mysqld-nt.exe`, `mysqld-debug.exe`, and `mysqlmanager.exe`. (Bug#26893)
- For `MERGE` tables defined on underlying tables that contained a short `VARCHAR` column (shorter than four characters), using `ALTER TABLE` on at least one but not all of the underlying tables caused the table definitions to be considered different from that of the `MERGE` table, even if the `ALTER TABLE` did not change the definition. (Bug#26881)
- Out-of-memory errors for slave I/O threads were not reported. Now they are written to the error log. (Bug#26844)
- Improved out-of-memory detection when sending logs from a master server to slaves, and log a message when allocation fails. (Bug#26837)
- For `InnoDB` tables having a clustered index that began with a `CHAR` or `VARCHAR` column, deleting a record and then inserting another before the deleted record was purged could result in table corruption. (Bug#26835)
- Use of a subquery containing `GROUP BY` and `WITH ROLLUP` caused a server crash. (Bug#26830)
- `mysqld` processes would sometimes crash under high load. (Bug#26825)
- Duplicates were not properly identified among (potentially) long strings used as arguments for `GROUP_CONCAT(DISTINCT)`. (Bug#26815)
- `ALTER VIEW` requires the `CREATE VIEW` and `DROP` privileges for the view. However, if the view was created by another user, the server erroneously required the `SUPER` privilege. (Bug#26813)
- Added support for `--debugger=dbx` for `mysql-test-run.pl` and fixed support for `--debugger=devenv`, `-debugger=DevEnv`, and `--debugger=/path/to/devenv`. (Bug#26792)
- A result set column formed by concatenation of string literals was incomplete when the column was produced by a subquery in the `FROM` clause. (Bug#26738)
- An infinite loop in an internal logging function could cause trace logs to fill up with `UNKNOWN SIGNAL TYPE` error messages and thus grow to unreasonable sizes. (Bug#26720)
- SSL connections failed on Windows. (Bug#26678)
- When using the result of `SEC_TO_TIME()` for time value greater than 24 hours in an `ORDER BY` clause, either directly or through a column alias, the rows were sorted incorrectly as strings. (Bug#26672)
- Use of a subquery containing a `UNION` with an invalid `ORDER BY` clause caused a server crash. (Bug#26661)
- The range optimizer could cause the server to run out of memory. (Bug#26625)
- The range optimizer could consume a combinatorial amount of memory for certain classes of `WHERE` clauses. (Bug#26624)
- In some error messages, inconsistent format specifiers were used for the translations in different languages. `comp_err` (the error message compiler) now checks for mismatches. (Bug#26571)
- Views that used a scalar correlated subquery returned incorrect results. (Bug#26560)
- `UNHEX() IS NULL` comparisons failed when `UNHEX()` returned `NULL`. (Bug#26537)
- On 64-bit Windows, large timestamp values could be handled incorrectly. (Bug#26536)
- The parser accepted illegal code in SQL exception handlers, leading to a crash at runtime when executing the code. (Bug#26503)
- `mysqldump` could crash or exhibit incorrect behavior when some options were given very long values, such as `-fields-terminated-by="some very long string"`. The code has been cleaned up to remove a number of fixed-sized buffers and to be more careful about error conditions in memory allocation. (Bug#26346)
- If the server was started with `--skip-grant-tables`, selecting from `INFORMATION_SCHEMA` tables causes a server crash. (Bug#26285)
- For some values of the position argument, the `INSERT()` function could insert a NUL byte into the result. (Bug#26281)
- For an `INSERT` statement that should fail due to a column with no default value not being assigned a value, the statement succeeded with no error if the column was assigned a value in an `ON DUPLICATE KEY UPDATE` clause, even if that clause was

not used. (Bug#26261)

- `INSERT DELAYED` statements inserted incorrect values into `BIT` columns. (Bug#26238)
- The temporary file-creation code was cleaned up on Windows to improve server stability. (Bug#26233)
- For `MyISAM` tables, `COUNT(*)` could return an incorrect value if the `WHERE` clause compared an indexed `TEXT` column to the empty string (`' '`). This happened if the column contained empty strings and also strings starting with control characters such as tab or newline. (Bug#26231)
- For `INSERT INTO ... SELECT` where index searches used column prefixes, insert errors could occur when key value type conversion was done. (Bug#26207)
- For `DELETE FROM tbl_name ORDER BY col_name` (with no `WHERE` or `LIMIT` clause), the server did not check whether `col_name` was a valid column in the table. (Bug#26186)
- `REPAIR TABLE ... USE_FRM` with an `ARCHIVE` table deleted all records from the table. (Bug#26138)
- A multiple-row delayed insert with an auto-increment column could cause duplicate entries to be created on the slave in a replication environment. (Bug#26116, Bug#25507)
- `BENCHMARK()` did not work correctly for expressions that produced a `DECIMAL` result. (Bug#26093)
- `LOAD DATA INFILE` sent an okay to the client before writing the binary log and committing the changes to the table had finished, thus violating `ACID` requirements. (Bug#26050)
- `X() IS NULL` and `Y() IS NULL` comparisons failed when `X()` and `Y()` returned `NULL`. (Bug#26038)
- `mysqldump` crashed for `MERGE` tables if the `--complete-insert (-c)` option was given. (Bug#25993)
- Indexes on `TEXT` columns were ignored when `ref` accesses were evaluated. (Bug#25971)
- If a thread previously serviced a connection that was killed, excessive memory and CPU use by the thread occurred if it later serviced a connection that had to wait for a table lock. (Bug#25966)
- Setting a column to `NOT NULL` with an `ON DELETE SET NULL` clause foreign key crashes the server. (Bug#25927)
- `VIEW` restrictions were applied to `SELECT` statements after a `CREATE VIEW` statement failed, as though the `CREATE` had succeeded. (Bug#25897)
- Several deficiencies in resolution of column names for `INSERT ... SELECT` statements were corrected. (Bug#25831)
- Inserting `utf8` data into a `TEXT` column that used a single-byte character set could result in spurious warnings about truncated data. (Bug#25815)
- On Windows, debug builds of `mysqld` could fail with heap assertions. (Bug#25765)
- In certain situations, `MATCH ... AGAINST` returned false hits for `NULL` values produced by `LEFT JOIN` when no full-text index was available. (Bug#25729)
- In certain cases it could happen that deleting a row corrupted an `RTREE` index. This affected indexes on spatial columns. (Bug#25673)
- When `RAND()` was called multiple times inside a stored procedure, the server did not write the correct random seed values to the binary log, resulting in incorrect replication. (Bug#25543)
- `OPTIMIZE TABLE` might fail on Windows when it attempts to rename a temporary file to the original name if the original file had been opened, resulting in loss of the `.MYD` file. (Bug#25521)
- For `SHOW ENGINE INNODB STATUS`, the `LATEST DEADLOCK INFORMATION` was not always cleared properly. (Bug#25494)
- `mysql_stmt_fetch()` did an invalid memory deallocation when used with the embedded server. (Bug#25492)
- `GRANT` statements were not replicated if the server was started with the `--replicate-ignore-table` or `--replicate-wild-ignore-table` option. (Bug#25482)
- Expressions involving `SUM()`, when used in an `ORDER BY` clause, could lead to out-of-order results. (Bug#25376)
- Use of a `GROUP BY` clause that referred to a stored function result together with `WITH ROLLUP` caused incorrect results. (Bug#25373)

- A stored procedure that made use of cursors failed when the procedure was invoked from a stored function. (Bug#25345)
- Difficult repair or optimization operations could cause an assertion failure, resulting in a server crash. (Bug#25289)
- On Windows, the server exhibited a file-handle leak after reaching the limit on the number of open file descriptors. (Bug#25222)
- The `REPEAT()` function did not allow a column name as the `count` parameter. (Bug#25197)
- Duplicating the usage of a user variable in a stored procedure or trigger would not be replicated correctly to the slave. (Bug#25167)
- A reference to a non-existent column in the `ORDER BY` clause of an `UPDATE ... ORDER BY` statement could cause a server crash. (Bug#25126)
- A view on a join is insertable for `INSERT` statements that store values into only one table of the join. However, inserts were being rejected if the inserted-into table was used in a self-join because MySQL incorrectly was considering the insert to modify multiple tables of the view. (Bug#25122)
- MySQL would not compile when configured using `--without-query-cache`. (Bug#25075)
- Duplicate entries were not assessed correctly in a `MEMORY` table with a `BTREE` primary key on a `utf8 ENUM` column. (Bug#24985)
- Selecting the result of `AVG()` within a `UNION` could produce incorrect values. (Bug#24791)
- `MBROverlaps()` returned incorrect values in some cases. (Bug#24563)
- Increasing the width of a `DECIMAL` column could cause column values to be changed. (Bug#24558)
- `IF(expr, unsigned_expr, unsigned_expr)` was evaluated to a signed result, not unsigned. This has been corrected. The fix also affects constructs of the form `IS [NOT] {TRUE|FALSE}`, which were transformed internally into `IF()` expressions that evaluated to a signed result.

For existing views that were defined using `IS [NOT] {TRUE|FALSE}` constructs, there is a related implication. The definitions of such views were stored using the `IF()` expression, not the original construct. This is manifest in that `SHOW CREATE VIEW` shows the transformed `IF()` expression, not the original one. Existing views will evaluate correctly after the fix, but if you want `SHOW CREATE VIEW` to display the original construct, you must drop the view and re-create it using its original definition. New views will retain the construct in their definition. (Bug#24532)

- A problem in handling of aggregate functions in subqueries caused predicates containing aggregate functions to be ignored during query execution. (Bug#24484)
- `DROP TRIGGER` statements would not be filtered on the slave when using the `replication-wild-do-table` option. (Bug#24478)
- For `INSERT ... ON DUPLICATE KEY UPDATE` statements where some `AUTO_INCREMENT` values were generated automatically for inserts and some rows were updated, one auto-generated value was lost per updated row, leading to faster exhaustion of the range of the `AUTO_INCREMENT` column.

Because the original problem can affect replication (different values on master and slave), it is recommended that the master and its slaves be upgraded to the current version. (Bug#24432)

- The test for the `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` option for `mysql_options()` was performed incorrectly. Also changed as a result of this bugfix: The `arg` option for the `mysql_options()` C API function was changed from `char *` to `void *`. (Bug#24121)
- Queries that used a temporary table for the outer query when evaluating a correlated subquery could return incorrect results. (Bug#23800)
- Replication between master and slave would infinitely retry binary log transmission where the `max_allowed_packet` on the master was larger than that on the slave if the size of the transfer was between these two values. (Bug#23775)
- On Windows, debug builds of `mysqlbinlog` could fail with a memory error. (Bug#23736)
- The values displayed for the `InnoDB_row_lock_time`, `InnoDB_row_lock_time_avg`, and `InnoDB_row_lock_time_max` status variables were incorrect. (Bug#23666)
- `DOUBLE` values such as `20070202191048.000000` were being treated as illegal arguments by `WEEK()`. (Bug#23616)
- The server could crash if two or more threads initiated query cache resize operation at moments very close in time.

-)
- `SHOW CREATE VIEW` qualified references to stored functions in the view definition with the function's database name, even when the database was the default database. This affected `mysqldump` (which uses `SHOW CREATE VIEW` to dump views) because the resulting dump file could not be used to reload the database into a different database. `SHOW CREATE VIEW` now suppresses the database name for references to functions in the default database. (Bug#23491)
 - An `INTO OUTFILE` clause is allowed only for the final `SELECT` of a `UNION`, but this restriction was not being enforced correctly. (Bug#23345)
 - `NOW()` returned the wrong value in statements executed at server startup with the `--init-file` option. (Bug#23240)
 - With the `NO_AUTO_VALUE_ON_ZERO` SQL mode enabled, `LAST_INSERT_ID()` could return 0 after `INSERT ... ON DUPLICATE KEY UPDATE`. Additionally, the next rows inserted (by the same `INSERT`, or the following `INSERT` with or without `ON DUPLICATE KEY UPDATE`), would insert 0 for the auto-generated value if the value for the `AUTO_INCREMENT` column was `NULL` or missing. (Bug#23233)
 - `SOUNDEX()` returned an invalid string for international characters in multi-byte character sets. (Bug#22638)
 - When nesting stored procedures within a trigger on a table, a false dependency error was thrown when one of the nested procedures contained a `DROP TABLE` statement. (Bug#22580)
 - Instance Manager did not remove the angel PID file on a clean shutdown. (Bug#22511)
 - `EXPLAIN EXTENDED` did not show `WHERE` conditions that were optimized away. (Bug#22331)
 - `COUNT(decimal_expr)` sometimes generated a spurious truncation warning. (Bug#21976)
 - `IN ((subquery))`, `IN (((subquery)))`, and so forth, are equivalent to `IN (subquery)`, which is always interpreted as a table subquery (so that it is allowed to return more than one row). MySQL was treating the “over-parenthesized” subquery as a single-row subquery and rejecting it if it returned more than one row. This bug primarily affected automatically generated code (such as queries generated by Hibernate), because humans rarely write the over-parenthesized forms. (Bug#21904)
 - An `INSERT` trigger invoking a stored routine that inserted into a table other than the one on which the trigger was defined would fail with a `TABLE '...' DOESN'T EXIST` referring to the second table when attempting to delete records from the first table. (Bug#21825)
 - For `InnoDB`, fixed consistent-read behavior of the first read statement, if the read was served from the query cache, for the `READ COMMITTED` isolation level. (Bug#21409)
 - `CURDATE()` is less than `NOW()`, either when comparing `CURDATE()` directly (`CURDATE() < NOW()` is true) or when casting `CURDATE()` to `DATE` (`CAST(CURDATE() AS DATE) < NOW()` is true). However, storing `CURDATE()` in a `DATE` column and comparing `col_name < NOW()` incorrectly yielded false. This is fixed by comparing a `DATE` column as `DATETIME` for comparisons to a `DATETIME` constant. (Bug #Bug#21103)
 - When a stored routine attempted to execute a statement accessing a nonexistent table, the error was not caught by the routine's exception handler. (Bug#20713, Bug#8407)
 - For a stored procedure containing a `SELECT` statement that used a complicated join with an `ON` expression, the expression could be ignored during re-execution of the procedure, yielding an incorrect result. (Bug#20492)
 - The conditions checked by the optimizer to allow use of indexes in `IN` predicate calculations were unnecessarily tight and were relaxed. (Bug#20420)
 - When a `TIME_FORMAT()` expression was used as a column in a `GROUP BY` clause, the expression result was truncated. (Bug#20293)
 - When using certain server SQL modes, the `mysql.proc` table was not created by `mysql_install_db`. In addition, the creation of this and other MySQL system tables was not checked for by `mysql-test-run.pl`. (Bug#20166, Bug#23669)
 - For index reads, the `BLACKHOLE` engine did not return end-of-file (which it must because `BLACKHOLE` tables contain no rows), causing some queries to crash. (Bug#19717)
 - In some cases, the optimizer preferred a range or full index scan access method over lookup access methods when the latter were much cheaper. (Bug#19372)
 - For `expr IN(value_list)`, the result could be incorrect if `BIGINT UNSIGNED` values were used for `expr` or in the value list. (Bug#19342)
 - When attempting to call a stored procedure creating a table from a trigger on a table `tbl` in a database `db`, the trigger failed

with `ERROR 1146 (42S02): TABLE 'DB.TBL' DOESN'T EXIST`. However, the actual reason that such a trigger fails is due to the fact that `CREATE TABLE` causes an implicit `COMMIT`, and so a trigger cannot invoke a stored routine containing this statement. A trigger which does so now fails with `ERROR 1422 (HY000): EXPLICIT OR IMPLICIT COMMIT IS NOT ALLOWED IN STORED FUNCTION OR TRIGGER`, which makes clear the reason for the trigger's failure. (Bug#18914)

- When trying to create tables on an SQL node not connected to the cluster, a misleading error message `TABLE 'TBL_NAME' ALREADY EXISTS` was generated. The error now generated is `COULD NOT CONNECT TO STORAGE ENGINE`. (Bug#18676)
- A user-defined variable could be assigned an incorrect value if a temporary table was employed in obtaining the result of the query used to determine its value. (Bug#16861)
- The update columns for `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` could be assigned incorrect values if a temporary table was used to evaluate the `SELECT`. (Bug#16630)
- Conversion of `DATETIME` values in numeric contexts sometimes did not produce a double (`YYYYMMDDHHMMSS.uuuuuu`) value. (Bug#16546)
- For `SUBSTRING()` evaluation using a temporary table, when `SUBSTRING()` was used on a `LONGTEXT` column, the `max_length` metadata value of the result was incorrectly calculated and set to 0. Consequently, an empty string was returned instead of the correct result. (Bug#15757)
- Loading data using `LOAD DATA INFILE` may not replicate correctly (due to character set incompatibilities) if the `character_set_database` variable is set before the data is loaded. (Bug#15126)
- User defined variables used within stored procedures and triggers are not replicated correctly when operating in statement-based replication mode. (Bug#14914, Bug#20141)
- Local variables in stored routines or triggers, when declared as the `BIT` type, were interpreted as strings. (Bug#12976)
- `CONNECTION` is no longer treated as a reserved word. (Bug#12204)
- The patch for the following bugs was reverted: Bug#19370, Bug#21789.

D.1.3. Release Notes for MySQL Community Server 5.0.37 (27 February 2007)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.33.

Functionality added or changed:

- **Incompatible Change:** Previously, the `DATE_FORMAT()` function returned a binary string. Now it returns a string with a character set and collation given by `character_set_connection` and `collation_connection` so that it can return month and weekday names containing non-ASCII characters. (Bug#22646)
- **MySQL Cluster:** The `LockPagesInMainMemory` configuration parameter has changed its type and possible values. For more information, see `LockPagesInMainMemory`.

Important

The values `true` and `false` are no longer accepted for this parameter. If you were using this parameter and had it set to `false` in a previous release, you must change it to `0`. If you had this parameter set to `true`, you should instead use `1` to obtain the same behavior as previously, or `2` to take advantage of new functionality introduced with this release described in the section cited above.

(Bug#25686)

- Added the `Uptime_since_flush_status` status variable, which indicates the number of seconds since the most recent `FLUSH STATUS` statement. (From Jeremy Cole) (Bug#24822)
- Added the `SHOW PROFILES` and `SHOW PROFILE` statements to display statement profile data, and the accompanying `INFORMATION_SCHEMA.PROFILING` table. Profiling is controlled via the `profiling` and `profiling_history_size` session variables. see Section 12.5.4.22, “`SHOW PROFILES` and `SHOW PROFILE Syntax`”, and Section 21.17, “`The INFORMATION_SCHEMA.PROFILING Table`”. (From Jeremy Cole) (Bug#24795)
- The `localhost` anonymous user account created during MySQL installation on Windows now has no global privileges. Formerly this account had all global privileges. For operations that require global privileges, the `root` account can be used instead. (Bug#24496)
- The `--skip-thread-priority` option now is enabled by default for binary Mac OS X distributions. Use of thread priorit-

ies degrades performance on Mac OS X. ([Bug#18526](#))

Important

When using `MERGE` tables the definition of the `MERGE` table and the `MyISAM` tables are checked each time the tables are opened for access (including any `SELECT` or `INSERT` statement). Each table is compared for column order, types, sizes and associated. If there is a difference in any one of the tables then the statement will fail.

- This is the last version for which MySQL-Max RPM distributions are available. (This change was already made for non-RPM binary distributions in 5.0.27.)
- The bundled yaSSL library was upgraded to version 1.5.8.
- Added the `--disable-grant-options` option to `configure`. If `configure` is run with this option, the `--bootstrap`, `--skip-grant-tables`, and `--init-file` options for `mysqld` are disabled and cannot be used. For Windows, the `configure.js` script recognizes the `DISABLE_GRANT_OPTIONS` flag, which has the same effect.

Bugs fixed:

- **Incompatible Change:** For `ENUM` columns that had enumeration values containing commas, the commas were mapped to `0xff` internally. However, this rendered the commas indistinguishable from true `0xff` characters in the values. This no longer occurs. However, the fix requires that you dump and reload any tables that have `ENUM` columns containing true `0xff` in their values: Dump the tables using `mysqldump` with the current server before upgrading from a version of MySQL 5.0 older than 5.0.36 to version 5.0.36 or newer. ([Bug#24660](#))
- **MySQL Cluster:** A query with an `IN` clause against an `NDB` table employing explicit user-defined partitioning did not always return all matching rows. ([Bug#25821](#))
- **MySQL Cluster:** It was not possible to create an `NDB` table with a key on two `VARCHAR` columns where both columns had a storage length in excess of 256. ([Bug#25746](#))
- **MySQL Cluster:** Hosts in clusters with a large number of nodes could experience excessive CPU usage while obtaining configuration data. ([Bug#25711](#))
- **MySQL Cluster:** In some circumstances, shutting down the cluster could cause connected `mysqld` processes to crash. ([Bug#25668](#))
- **MySQL Cluster:** Memory allocations for `TEXT` columns were calculated incorrectly, resulting in space being wasted and other issues. ([Bug#25562](#))
- **MySQL Cluster:** The failure of a master node during a node restart could lead to a resource leak, causing later node failures. ([Bug#25554](#))
- **MySQL Cluster:** An `UPDATE` using an `IN` clause on an `NDB` table on which there was a trigger caused `mysqld` to crash. ([Bug#25522](#))
- **MySQL Cluster:** (Cluster APIs): Deletion of an `Ndb_cluster_connection` object took a very long time. ([Bug#25487](#))
- **MySQL Cluster:** A node shutdown occurred if the master failed during a commit. ([Bug#25364](#))
- **MySQL Cluster:** (NDB API): Invoking the `NdbTransaction::execute()` method using execution type `Commit` and abort option `AO_IgnoreError` could lead to a crash of the transaction coordinator (DBTC). ([Bug#25090](#))
- **MySQL Cluster:** (NDB API): A unique index lookup on a non-existent tuple could lead to a data node timeout (error 4012). ([Bug#25059](#))
- **MySQL Cluster:** Creating a non-unique index with the `USING HASH` clause silently created an ordered index instead of issuing a warning. ([Bug#24820](#))
- **MySQL Cluster:** The `ndb_size.tmp1` file (necessary for using the `ndb_size.pl` script) was missing from binary distributions. ([Bug#24191](#))
- **MySQL Cluster:** The management server did not handle logging of node shutdown events correctly in certain cases. ([Bug#22013](#))
- **MySQL Cluster:** `SELECT` statements with a `BLOB` or `TEXT` column in the selected column list and a `WHERE` condition including a primary key lookup on a `VARCHAR` primary key produced empty result sets. ([Bug#19956](#))

- **MySQL Cluster:** (Cluster APIs): `libndbclient.so` was not versioned. (Bug#13522)
- Using an `INFORMATION_SCHEMA` table with `ORDER BY` in a subquery could cause a server crash. (Bug#26556, Bug#24630)
- Using `ORDER BY` or `GROUP BY` could yield different results when selecting from a view and selecting from the underlying table. (Bug#26209)
- `DISTINCT` queries that were executed using a loose scan for an `InnoDB` table that had been emptied caused a server crash. (Bug#26159)
- A `WHERE` clause that used `BETWEEN` for `DATETIME` values could be treated differently for a `SELECT` and a view defined as that `SELECT`. (Bug#26124)
- Collation for `LEFT JOIN` comparisons could be evaluated incorrectly, leading to improper query results. (Bug#26017)
- The `WITH CHECK OPTION` clause for views was ignored for updates of multiple-table views when the updates could not be performed on fly and the rows to update had to be put into temporary tables first. (Bug#25931)
- `LOAD DATA INFILE` did not work with pipes. (Bug#25807)
- The `SEC_TO_TIME()` and `QUARTER()` functions sometimes did not handle `NULL` values correctly. (Bug#25643)
- The `InnoDB` parser sometimes did not account for null bytes, causing spurious failure of some queries. (Bug#25596)
- View definitions that used the `!` operator were treated as containing the `NOT` operator, which has a different precedence and can produce different results. (Bug#25580)
- An error in the name resolution of nested `JOIN ... USING` constructs was corrected. (Bug#25575)
- `GROUP BY` and `DISTINCT` did not group `NULL` values for columns that have a `UNIQUE` index. (Bug#25551)
- The `--with-readline` option for `configure` does not work for commercial source packages, but no error message was printed to that effect. Now a message is printed. (Bug#25530)
- `mysql_stmt_fetch()` did an invalid memory deallocation when used with the embedded server. (Bug #Bug#25492)
- Referencing an ambiguous column alias in an expression in the `ORDER BY` clause of a query caused the server to crash. (Bug#25427)
- A `yaSSL` program named `test` was installed, causing conflicts with the `test` system utility. It is no longer installed. (Bug#25417)
- For a `UNIQUE` index containing many `NULL` values, the optimizer would prefer the index for `col IS NULL` conditions over other more selective indexes. (Bug#25407)
- An `AFTER UPDATE` trigger on an `InnoDB` table with a composite primary key caused the server to crash. (Bug#25398)
- Passing a `NULL` value to a user-defined function from within a stored procedure crashes the server. (Bug#25382)
- `pererror` crashed on some platforms due to failure to handle a `NULL` pointer. (Bug#25344)
- `mysql.server stop` timed out too quickly (35 seconds) waiting for the server to exit. Now it waits up to 15 minutes, to ensure that the server exits. (Bug#25341)
- A query that contained an `EXIST` subquery with a `UNION` over correlated and uncorrelated `SELECT` queries could cause the server to crash. (Bug#25219)
- `mysql_kill()` caused a server crash when used on an SSL connection. (Bug#25203)
- `yaSSL` was sensitive to the presence of whitespace at the ends of lines in PEM-encoded certificates, causing a server crash. (Bug#25189)
- A query with `ORDER BY` and `GROUP BY` clauses where the `ORDER BY` clause had more elements than the `GROUP BY` clause caused a memory overrun leading to a crash of the server. (Bug#25172)
- Use of `ON DUPLICATE KEY UPDATE` defeated the usual restriction against inserting into a join-based view unless only one of the underlying tables is used. (Bug#25123)
- Using a view in combination with a `USING` clause caused column aliases to be ignored. (Bug#25106)
- A multiple-table `DELETE QUICK` could sometimes cause one of the affected tables to become corrupted. (Bug#25048)

- `ALTER TABLE ... ENABLE KEYS` acquired a global lock, preventing concurrent execution of other statements that use tables. (Bug#25044)
- An assertion failed incorrectly for prepared statements that contained a single-row uncorrelated subquery that was used as an argument of the IS NULL predicate. (Bug#25027)
- A return value of `-1` from user-defined handlers was not handled well and could result in conflicts with server code. (Bug#24987)
- Accessing a fixed record format table with a crashed key definition results in server/`myisamchk` segmentation fault. (Bug#24855)
- `mysqld_multi` and `mysqlaccess` looked for option files in `/etc` even if the `--sysconfdir` option for `configure` had been given to specify a different directory. (Bug#24780)
- If there was insufficient memory available to `mysqld`, this could sometimes cause the server to hang during startup. (Bug#24751)
- Optimizations that are legal only for subqueries without tables and `WHERE` conditions were applied for any subquery without tables. (Bug#24670)
- If an `ORDER BY` or `GROUP BY` list included a constant expression being optimized away and, at the same time, containing single-row subselects that return more than one row, no error was reported. If a query requires sorting by expressions containing single-row subselects that return more than one row, execution of the query may cause a server crash. (Bug#24653)
- For `ALTER TABLE`, using `ORDER BY expression` could cause a server crash. Now the `ORDER BY` clause allows only column names to be specified as sort criteria (which was the only documented syntax, anyway). (Bug#24562)
- A workaround was implemented to avoid a race condition in the NPTL `pthread_exit()` implementation. (Bug#24507)
- `mysqltest` crashed with a stack overflow. (Bug#24498)
- Within stored routines or prepared statements, inconsistent results occurred with multiple use of `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` when the `ON DUPLICATE KEY UPDATE` clause erroneously tried to assign a value to a column mentioned only in its `SELECT` part. (Bug#24491)
- Expressions of the form `(a, b) IN (SELECT a, MIN(b) FROM t GROUP BY a)` could produce incorrect results when column `a` of table `t` contained `NULL` values while column `b` did not. (Bug#24420)
- If a prepared statement accessed a view, access to the tables listed in the query after that view was checked in the security context of the view. (Bug#24404)
- Attempts to access a `MyISAM` table with a corrupt column definition caused a server crash. (Bug#24401)
- When opening a corrupted `.frm` file during a query, the server crashes. (Bug#24358)
- Some joins in which one of the joined tables was a view could return erroneous results or crash the server. (Bug#24345)
- A view was not handled correctly if the `SELECT` part contained “`\z`”. (Bug#24293)
- A query using `WHERE unsigned_column NOT IN ('negative_value')` could cause the server to crash. (Bug#24261)
- When `SET PASSWORD` was written to the binary log double quotes were included in the statement. If the slave was running in with the `sql_mode` set to `ANSI_QUOTES` the event would fail and halt the replication process. (Bug#24158)
- SSL connections could hang at connection shutdown. (Bug#24148)
- Expressions of the form `(a, b) IN (SELECT c, d ...)` could produce incorrect results if `a`, `b`, or both were `NULL`. (Bug#24127)
- A `FETCH` statement using a cursor on a table which was not in the table cache could sometimes cause the server to crash. (Bug#24117)
- Queries that evaluate `NULL IN (SELECT ... UNION SELECT ...)` could produce an incorrect result (`FALSE` instead of `NULL`). (Bug#24085)
- Hebrew-to-Unicode conversion failed for some characters. Definitions for the following Hebrew characters (as specified by the ISO/IEC 8859-8:1999) were added: LEFT-TO-RIGHT MARK (LRM), RIGHT-TO-LEFT MARK (RLM) (Bug#24037)
- Some `UPDATE` statements were slower than in previous versions when the search key could not be converted to a valid value

for the type of the search column. (Bug#24035)

- The server was built even when `configure` was run with the `--without-server` option. (Bug#23973)
- `ISNULL(DATE(NULL))` and `ISNULL(CAST(NULL AS DATE))` erroneously returned false. (Bug#23938)
- Within a stored routine, accessing a declared routine variable with `PROCEDURE ANALYSE()` caused a server crash. (Bug#23782)
- When reading from the standard input on Windows, `mysqlbinlog` opened the input in text mode rather than binary mode and consequently misinterpreted some characters such as Control-Z. (Bug#23735)
- A stored procedure, executed from a connection using a binary character set, and which wrote multibyte data, would write incorrectly escaped entries to the binary log. This caused syntax errors, and caused replication to fail. (Bug#23619, Bug#24492)
- `OPTIMIZE TABLE` tried to sort R-tree indexes such as spatial indexes, although this is not possible (see Section 12.5.2.5, “`OPTIMIZE TABLE Syntax`”). (Bug#23578)
- For an InnoDB table with any `ON DELETE` trigger, `TRUNCATE TABLE` mapped to `DELETE` and activated triggers. Now a fast truncation occurs and triggers are not activated. . (Bug#23556)
- The row count for MyISAM tables was not updated properly, causing `SHOW TABLE STATUS` to report incorrect values. (Bug#23526)
- User-defined variables could consume excess memory, leading to a crash caused by the exhaustion of resources available to the MEMORY storage engine, due to the fact that this engine is used by MySQL for variable storage and intermediate results of `GROUP BY` queries. Where `SET` had been used, such a condition could instead give rise to the misleading error message `YOU MAY ONLY USE CONSTANT EXPRESSIONS WITH SET, rather than OUT OF MEMORY (NEEDED NNNNNN BYTES)`. (Bug#23443)
- With `ONLY_FULL_GROUP_BY` enabled, the server was too strict: Some expressions involving only aggregate values were rejected as non-aggregate (for example, `MAX(a) - MIN(a)`). (Bug#23417)
- The arguments of the `ENCODE()` and the `DECODE()` functions were not printed correctly, causing problems in the output of `EXPLAIN EXTENDED` and in view definitions. (Bug#23409)
- A table created with the `ROW_FORMAT = FIXED` table option loses the option if an index is added or dropped with `CREATE INDEX` or `DROP INDEX`. (Bug#23404)
- A deadlock could occur, with the server hanging on `Closing tables`, with a sufficient number of concurrent `INSERT DELAYED`, `FLUSH TABLES`, and `ALTER TABLE` operations. (Bug#23312)
- Some queries against `INFORMATION_SCHEMA` that used subqueries failed. . (Bug#23299)
- `readline` detection did not work correctly on NetBSD. (Bug#23293)
- If there was insufficient memory to store or update a blob record in a MyISAM table then the table will be marked as crashed. (Bug#23196)
- `LAST_INSERT_ID()` was not reset to 0 if `INSERT . . . SELECT` inserted no rows. (Bug#23170)
- A compressed MyISAM table that became corrupted could crash `myisamchk` and possibly the MySQL Server. (Bug#23139)
- The number of `setsockopt()` calls performed for reads and writes to the network socket was reduced to decrease system call overhead. (Bug#22943)
- `mysql_upgrade` failed when called with a `basedir` pathname containing spaces. (Bug#22801)
- When a data node was shut down using the management client `STOP` command, a connection event (`NDB_LE_Connected`) was logged instead of a disconnection event (`NDB_LE_Disconnected`). (Bug#22773)
- `SET lc_time_names = value` allowed only exact literal values, not expression values. (Bug#22647)
- Changes to the `lc_time_names` system variable were not replicated. (Bug#22645)
- The `STDDEV()` function returned a positive value for data sets consisting of a single value. (Bug#22555)
- Storing values specified as hexadecimal values 64 or more bits long into `BIT(64)`, `BIGINT`, or `BIGINT UNSIGNED` columns did not raise any warning or error if the value was out of range. (Bug#22533)
- `SHOW COLUMNS` reported some `NOT NULL` columns as `NULL`. (Bug#22377)

- Type conversion errors during formation of index search conditions were not correctly checked, leading to incorrect query results. (Bug#22344)
- Changing the value of `MI_KEY_BLOCK_LENGTH` in `mysam.h` and recompiling MySQL resulted in a `mysamchk` that saw existing MyISAM tables as corrupt. (Bug#22119)
- Re-execution of `CREATE DATABASE`, `CREATE TABLE`, and `ALTER TABLE` statements in stored routines or as prepared statements caused incorrect results or crashes. (Bug#22060)
- A crash of the MySQL Server could occur when unpacking a `BLOB` column from a row in a corrupted MyISAM table. This could happen when trying to repair a table using either `REPAIR TABLE` or `mysamchk`; it could also happen when trying to access such a “broken” row using statements like `SELECT` if the table was not marked as crashed. (Bug#22053)
- The code for generating `USE` statements for binary logging of `CREATE PROCEDURE` statements resulted in confusing output from `mysqlbinlog` for `DROP PROCEDURE` statements. (Bug#22043)
- For the `IF()` and `COALESCE()` function and `CASE` expressions, large unsigned integer values could be mishandled and result in warnings. (Bug#22026)
- The `FEDERATED` storage engine did not support the `euckr` character set. (Bug#21556)
- When updating a table that used a `JOIN` of the table itself (for example, when building trees) and the table was modified on one side of the expression, the table would either be reported as crashed or the wrong rows in the table would be updated. (Bug#21310)
- `mysqld_error.h` was not installed when only the client libraries were built. (Bug#21265)
- `InnoDB`: During a restart of the MySQL Server that followed the creation of a temporary table using the `InnoDB` storage engine, MySQL failed to clean up in such a way that `InnoDB` still attempted to find the files associated with such tables. (Bug#20867)
- Inserting `DEFAULT` into a column with no default value could result in garbage in the column. Now the same result occurs as when inserting `NULL` into a `NOT NULL` column. (Bug#20691)
- A stored routine containing semicolon in its body could not be reloaded from a dump of a binary log. (Bug#20396)
- `SELECT ... FOR UPDATE`, `SELECT ... LOCK IN SHARE MODE`, `DELETE`, and `UPDATE` statements executed using a full table scan were not releasing locks on rows that did not satisfy the `WHERE` condition. (Bug#20390)
- On Windows, if the server was installed as a service, it did not auto-detect the location of the data directory. (Bug#20376)
- The `BUILD/check-cpu` script did not recognize Celeron processors. (Bug#20061)
- If the duplicate key value was present in the table, `INSERT ... ON DUPLICATE KEY UPDATE` reported a row count indicating that a record was updated, even when no record actually changed due to the old and new values being the same. Now it reports a row count of zero. (Bug#19978)
- The internal functions for table preparation, creation, and alteration were not re-execution friendly, causing problems in code that: repeatedly altered a table; repeatedly created and dropped a table; opened and closed a cursor on a table, altered the table, and then reopened the cursor. (Bug#19733, Bug#19182, Bug#4968, Bug#6895)
- For `SET`, `SELECT`, and `DO` statements that invoked a stored function from a database other than the default database, the function invocation could fail to be replicated. (Bug#19725)
- `ORDER BY` on `DOUBLE` values could change the set of rows returned by a query. (Bug#19690)
- The `readline` library wrote to uninitialized memory, causing `mysql` to crash. (Bug#19474)
- `mysqltest` incorrectly tried to retrieve result sets for some queries where no result set was available. (Bug#19410)
- Use of already freed memory caused SSL connections to hang forever. (Bug#19209)
- Some `CASE` statements inside stored routines could lead to excessive resource usage or a crash of the server. (Bug#19194, Bug#24854)
- Instance Manager could crash during shutdown. (Bug#19044)
- The server might fail to use an appropriate index for `DELETE` when `ORDER BY`, `LIMIT`, and a non-restricting `WHERE` are present. (Bug#17711)
- No warning was issued for use of the `DATA DIRECTORY` or `INDEX DIRECTORY` table options on a platform that does not

support them. (Bug#17498)

- The `FEDERATED` storage engine did not support the `utf8` character set. (Bug#17044)
- A user-defined variable could be assigned an incorrect value if a temporary table was employed in obtaining the result of the query used to determine its value. (Bug #Bug#16861)
- The optimizer removes expressions from `GROUP BY` and `DISTINCT` clauses if they happen to participate in `expression = constant` predicates of the `WHERE` clause, the idea being that, if the expression is equal to a constant, then it cannot take on multiple values. However, for predicates where the expression and the constant item are of different result types (for example, when a string column is compared to 0), this is not valid, and can lead to invalid results in such cases. The optimizer now performs an additional check of the result types of the expression and the constant; if their types differ, then the expression is not removed from the `GROUP BY` list. (Bug#15881)
- When a prepared statement failed during the prepare operation, the error code was not cleared when it was reused, even if the subsequent use was successful. (Bug#15518)
- Dropping a user-defined function sometimes did not remove the UDF entry from the `mysql.proc` table. (Bug#15439)
- Inserting a row into a table without specifying a value for a `BINARY(N) NOT NULL` column caused the column to be set to spaces, not zeroes. (Bug#14171)
- On Windows, the `SLEEP()` function could sleep too long, especially after a change to the system clock. (Bug#14094, Bug#24686, Bug#17635)
- `mysqldump --order-by-primary` failed if the primary key name was an identifier that required quoting. (Bug#13926)
- To enable installation of MySQL RPMs on Linux systems running RHEL 4 (which includes SE-Linux) additional information was provided to specify some actions that are allowed to the MySQL binaries. (Bug#12676)
- The presence of `ORDER BY` in a view definition prevented the `MERGE` algorithm from being used to resolve the view even if nothing else in the definition required the `TEMPTABLE` algorithm. (Bug#12122)
- If a slave server closed its relay log (for example, due to an error during log rotation), the I/O thread did not recognize this and still tried to write to the log, causing a server crash. (Bug#10798)

D.1.4. Release Notes for MySQL Community Server 5.0.33 (09 January 2007)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.27.

Note

This version of MySQL Community Server has been released as a source tarball only; there are no binaries built by MySQL.

Functionality added or changed:

- **Incompatible Change:** In MySQL 5.0.13 and up, `InnoDB` rolls back only the last statement on a transaction timeout. A new option, `--innodb_rollback_on_timeout`, causes `InnoDB` to abort and roll back the entire transaction if a transaction timeout occurs (the same behavior as before MySQL 5.0.13). (Bug#24200)
- **Incompatible Change:** The `prepared_stmt_count` system variable has been converted to the `Prepared_stmt_count` global status variable (viewable with the `SHOW GLOBAL STATUS` statement). (Bug#23159)
- **MySQL Cluster:** Setting the configuration parameter `LockPagesInMainMemory` had no effect. (Bug#24461)
- **MySQL Cluster:** The `ndb_config` utility now accepts `-c` as a short form of the `--ndb-connectstring` option. (Bug#22295)
- **MySQL Cluster:** Added the `--bind-address` option for `ndbd`. This allows a data node process to be bound to a specific network interface. (Bug#22195)
- **MySQL Cluster:** It is now possible to create a unique hashed index on a column that is not defined as `NOT NULL`. *Note that this change applies only to tables using the `NDB` storage engine.*

Unique indexes on columns in `NDB` tables do not store null values because they are mapped to primary keys in an internal index table (and primary keys cannot contain nulls).

Normally, an additional ordered index is created when one creates unique indexes on `NDB` table columns; this can be used to

search for `NULL` values. However, if `USING HASH` is specified when such an index is created, no ordered index is created.

The reason for permitting unique hash indexes with null values is that, in some cases, the user wants to save space if a large number of records are pre-allocated but not fully initialized. This also assumes that the user will *not* try to search for null values. Since MySQL does not support indexes that are not allowed to be searched in some cases, the `NDB` storage engine uses a full table scan with pushed conditions for the referenced index columns to return the correct result.

Note that a warning is returned if one creates a unique nullable hash index, since the query optimizer should be provided a hint not to use it with `NULL` values if this can be avoided. (Bug#21507)

- **MySQL Cluster:** The `Ndb_number_of_storage_nodes` system variable was renamed to `Ndb_number_of_data_nodes`. (Bug#20848)
- **MySQL Cluster:** The `HELP` command in the Cluster management client now provides command-specific help. For example, `HELP RESTART` in `ndb_mgm` provides detailed information about the `START` command. (Bug#19620)
- `DROP TRIGGER` now supports an `IF EXISTS` clause. (Bug#23703)
- The `Com_create_user` status variable was added (for counting `CREATE USER` statements). (Bug#22958)
- The `--memlock` option relies on system calls that are unreliable on some operating systems. If a crash occurs, the server now checks whether `--memlock` was specified and if so issues some information about possible workarounds. (Bug#22860)
- If the user specified the server options `--max-connections=N` or `--table-open-cache=M`, a warning would be given in some cases that some values were recalculated, with the result that `--table-open-cache` could be assigned greater value.

It should be noted that, in such cases, both the warning and the increase in the `--table-open-cache` value were completely harmless. Note also that it is not possible for the MySQL Server to predict or to control limitations on the maximum number of open files, since this is determined by the operating system.

The recalculation code has now been fixed to ensure that the value of `--table-open-cache` is no longer increased automatically, and that a warning is now given only if some values had to be decreased due to operating system limits. (Bug#21915)

- For the `CALL` statement, stored procedures that take no arguments now can be invoked without parentheses. That is, `CALL p()` and `CALL p` are equivalent. (Bug#21462)
- `mysql_upgrade` now passes all the parameters specified on the command line to both `mysqlcheck` and `mysql` using the `upgrade_defaults` file. (Bug#20100)
- `SHOW STATUS` is no longer logged to the slow query log. (Bug#19764)
- `mysqldump --single-transaction` now uses `START TRANSACTION /*!40100 WITH CONSISTENT SNAPSHOT */` rather than `BEGIN` to start a transaction, so that a consistent snapshot will be used on those servers that support it. (Bug#19660)
- The bundled yaSSL library was upgraded to version 1.5.0.

Bugs fixed:

- **MySQL Cluster:** The failure of a data node failure during a schema operation could lead to additional node failures. (Bug#24752)
- **MySQL Cluster:** A committed read could be attempted before a data node had time to connect, causing a timeout error. (Bug#24717)
- **MySQL Cluster:** (Cluster APIs): Using `BIT` values with any of the comparison methods of the `NdbScanFilter` class caused the cluster's data nodes to fail. (Bug#24503)
- **MySQL Cluster:** Sudden disconnection of an SQL or data node could lead to shutdown of data nodes with the error `FAILED NDBREQUIRE`. (Bug#24447)
- **MySQL Cluster:** (Cluster APIs): Some MGM API function calls could yield incorrect return values in certain cases where the cluster was operating under a very high load, or experienced timeouts in inter-node communications. (Bug#24011)
- **MySQL Cluster:** `ndb_config` failed when trying to use 2 management servers and node IDs. (Bug#23887)
- **MySQL Cluster:** Restoring a cluster failed if there were any tables with 128 or more columns. (Bug#23502, Bug#23494)

- **MySQL Cluster:** Cluster backups would fail when there were more than 2048 schema objects in the cluster. ([Bug#23499](#))
- **MySQL Cluster:** The management client command `ALL DUMP 1000` would cause the cluster to crash if data nodes were connected to the cluster but not yet fully started. ([Bug#23203](#))
- **MySQL Cluster:** `INSERT ... ON DUPLICATE KEY UPDATE` on an `NDB` table could lead to deadlocks and memory leaks. ([Bug#23200](#))
- **MySQL Cluster:** (NDB API): Inactivity timeouts for scans were not correctly handled. ([Bug#23107](#))
- **MySQL Cluster:** If a node restart could not be performed from the REDO log, no node takeover took place. This could cause partitions to be left empty during a system restart. ([Bug#22893](#))
- **MySQL Cluster:** Multiple node restarts in rapid succession could cause a system restart to fail, or induce a race condition. ([Bug#22892](#), [Bug#23210](#))
- **MySQL Cluster:** (NDB API): Attempting to read a nonexistent tuple using `Commit` mode for `NdbTransaction::execute()` caused node failures. ([Bug#22672](#))
- **MySQL Cluster:** The `--help` output from `NDB` binaries did not include file-related options. ([Bug#21994](#))
- **MySQL Cluster:** (NDB API): Scans closed before being executed were still placed in the send queue. ([Bug#21941](#))
- **MySQL Cluster:** A scan timeout returned Error 4028 (`NODE FAILURE CAUSED ABORT OF TRANSACTION`) instead of Error 4008 (`NODE FAILURE CAUSED ABORT OF TRANSACTION...`). ([Bug#21799](#))
- **MySQL Cluster:** The node recovery algorithm was missing a version check for tables in the `ALTER_TABLE_COMMITTED` state (as opposed to the `TABLE_ADD_COMMITTED` state, which has the version check). This could cause inconsistent schemas across nodes following node recovery. ([Bug#21756](#))
- **MySQL Cluster:** The output for the `--help` option used with `NDB` executable programs (`ndbd`, `ndb_mgm`, `ndb_restore`, `ndb_config`, and so on) referred to the `Ndb.cfg` file, instead of `my.cnf`. ([Bug#21585](#))
- **MySQL Cluster:** Partition distribution keys were updated only for the primary and starting replicas during node recovery. This could lead to node failure recovery for clusters having an odd number of replicas.

Note

We recommend values for `NumberOfReplicas` that are even powers of 2, for best results.

([Bug#21535](#))

- **MySQL Cluster:** The `ndb_mgm` management client did not set the exit status on errors, always returning 0 instead. ([Bug#21530](#))
- **MySQL Cluster:** Attempting to create an `NDB` table on a MySQL with an existing non-Cluster table with the same name in the same database could result in data loss or corruption. MySQL now issues a warning when a `SHOW TABLES` or other statement causing table discovery finds such a table. ([Bug#21378](#))
- **MySQL Cluster:** Cluster logs were not rotated following the first rotation cycle. ([Bug#21345](#))
- **MySQL Cluster:** When inserting a row into an `NDB` table with a duplicate value for a non-primary unique key, the error issued would reference the wrong key. ([Bug#21072](#))
- **MySQL Cluster:** Condition pushdown did not work correctly with `DATETIME` columns. ([Bug#21056](#))
- **MySQL Cluster:** (NDB API): The `NdbOperation::getBlobHandle()` method, when called with the name of a nonexistent column, caused a segmentation fault. ([Bug#21036](#))
- **MySQL Cluster:** Under some circumstances, local checkpointing would hang, keeping any unstarted nodes from being started. ([Bug#20895](#))
- **MySQL Cluster:** Using an invalid node ID with the management client `STOP` command could cause `ndb_mgm` to hang. ([Bug#20575](#))
- **MySQL Cluster:** (NDB API): When multiple processes or threads in parallel performed the same ordered scan with exclusive lock and updating the retrieved records, the scan could skip some records, which were not updated as a result. ([Bug#20446](#))
- **MySQL Cluster:** Data nodes added while the cluster was running in single user mode were all assigned node ID 0, which could later cause multiple node failures. Adding of nodes in single user mode is no longer possible. ([Bug#20395](#))

- **MySQL Cluster:** In some cases where `SELECT COUNT(*)` from an `NDB` table should have yielded an error, `MAX_INT` was returned instead. (Bug#19914)
- **MySQL Cluster:** Following the restart of an `MGM` node, the Cluster management client did not automatically reconnect. (Bug#19873)
- **MySQL Cluster:** Error messages given when trying to make online changes parameters such as `NoOfReplicas` that can only be changed via a complete shutdown and restart of the cluster did not indicate the true nature of the problem. (Bug#19787)
- **MySQL Cluster:** `ndb_restore` did not always make clear that it had recovered successfully from temporary errors while restoring a cluster backup. (Bug#19651)
- **MySQL Cluster:** In rare situations with resource shortages, a crash could result from insufficient `IndexScanOperations`. (Bug#19198)
- **MySQL Cluster:** `ndb_mgm -e show | head` would hang after displaying the first 10 lines of output. (Bug#19047)
- **MySQL Cluster:** The error returned by the cluster when too many nodes were defined did not make clear the nature of the problem. (Bug#19045)
- **MySQL Cluster:** A unique constraint violation was not ignored by an `UPDATE IGNORE` statement when the constraint violation occurred on a non-primary key. (Bug#18487, Bug#24303)
- **MySQL Cluster:** The `ndb_config` utility did not perform host lookups correctly when using the `--host` option. (Bug#17582)
- **MySQL Cluster:** The `ndb_config` utility did not perform host lookups correctly when using the `--host` option (Bug#17582)
- **MySQL Cluster:** A problem with takeover during a system restart caused ordered indexes to be rebuilt incorrectly. (Bug#15303)
- The `REPEAT()` function could return `NULL` when passed a column for the count argument. (Bug#24947)
- `mysql_upgrade` failed if the `--password` (or `-p`) option was given. (Bug#24896)
- With `innodb_file_per_table` enabled, `InnoDB` displayed incorrect file times in the output from `SHOW TABLE STATUS`. (Bug#24712)
- `ALTER ENABLE KEYS` or `ALTER TABLE DISABLE KEYS` combined with another `ALTER TABLE` option other than `RENAME TO` did nothing. In addition, if `ALTER TABLE` was used on a table having disabled keys, the keys of the resulting table were enabled. (Bug#24395)
- The `InnoDB` mutex structure was simplified to reduce memory load. (Bug#24386)
- The `--extern` option for `mysql-test-run.pl` did not function correctly. (Bug#24354)
- Foreign key identifiers for `InnoDB` tables could not contain certain characters. (Bug#24299)
- The `mysql.server` script used the `source` command, which is less portable than the `.` command; it now uses `.` instead. (Bug#24294)
- The loose index scan optimization for `GROUP BY` with `MIN` or `MAX` was not applied within other queries, such as `CREATE TABLE ... SELECT ...`, `INSERT ... SELECT ...`, or in the `FROM` clauses of subqueries. (Bug#24156)
- There was a race condition in the `InnoDB fil_flush_file_spaces()` function. (Bug#24089)
- `ALTER TABLE` statements that performed both `RENAME TO` and `{ENABLE|DISABLE} KEYS` operations caused a server crash. (Bug#24089)
- Subqueries for which a pushed-down condition did not produce exactly one key field could cause a server crash. (Bug#24056)
- The size of `MEMORY` tables and internal temporary tables was limited to 4GB on 64-bit Windows systems. (Bug#24052)
- Some `yaSSL`-related memory leaks detected by `Valgrind` were fixed. (Bug#23981)
- The internal SQL interpreter of `InnoDB` placed an unnecessary lock on the supremum record when `innodb_locks_unsafe_for_binlog=1`. This caused an assertion failure when `InnoDB` was built with debugging enabled. (Bug#23769)
- `ROW_COUNT()` did not work properly as an argument to a stored procedure. (Bug#23760)

- `LAST_DAY('0000-00-00')` could cause a server crash. (Bug#23653)
- A trigger that invoked a stored function could cause a server crash when activated by different client connections. (Bug#23651)
- The stack size for NetWare binaries was increased to 128KB to prevent problems caused by insufficient stack size. (Bug#23504)
- If elements in a non-top-level `IN` subquery were accessed by an index and the subquery result set included a `NULL` value, the quantified predicate that contained the subquery was evaluated to `NULL` when it should return a non-`NULL` value. (Bug#23478)
- When applying the `group_concat_max_len` limit, `GROUP_CONCAT()` could truncate multi-byte characters in the middle. (Bug#23451)
- MySQL 5.0.26 introduced an ABI incompatibility, which this release reverts. Programs compiled against 5.0.26 are not compatible with any other version and must be recompiled. (Bug#23427)
- `M % 0` returns `NULL`, but `(M % 0) IS NULL` evaluated to false. (Bug#23411)
- `mysql_affected_rows()` could return values different from `mysql_stmt_affected_rows()` for the same sequence of statements. (Bug#23383)
- For not-yet-authenticated connections, the `Time` column in `SHOW PROCESSLIST` was a random value rather than `NULL`. (Bug#23379)
- Accuracy was improved for comparisons between `DECIMAL` columns and numbers represented as strings. (Bug#23260)
- MySQL would fail to build on the Alpha platform. (Bug#23256)
- If `COMPRESS()` returned `NULL`, subsequent invocations of `COMPRESS()` within a result set or within a trigger also returned `NULL`. (Bug#23254)
- Calculation of `COUNT(DISTINCT)`, `AVG(DISTINCT)`, or `SUM(DISTINCT)` when they are referenced more than once in a single query with `GROUP BY` could cause a server crash. (Bug#23184)
- Insufficient memory (`myisam_sort_buffer_size`) could cause a server crash for several operations on `MyISAM` tables: repair table, create index by sort, repair by sort, parallel repair, bulk insert. (Bug#23175)
- The column default value in the output from `SHOW COLUMNS` or `SELECT FROM INFORMATION_SCHEMA.COLUMNS` was truncated to 64 characters. (Bug#23037)
- `mysql` did not check for errors when fetching data during result set printing. (Bug#22913)
- Changes to character set variables prior to an action on a replication-ignored table were forgotten by slave servers. (Bug#22877)
- `InnoDB` exhibited thread thrashing with more than 50 concurrent connections under an update-intensive workload. (Bug#22868)
- The return value from `my_seek()` was ignored. (Bug#22828)
- The optimizer failed to use equality propagation for `BETWEEN` and `IN` predicates with string arguments. (Bug#22753)
- The `Host` column in `SHOW PROCESSLIST` output was blank when the server was started with the `-skip-grant-tables` option. (Bug#22728)
- The `Handler_rollback` status variable sometimes was incremented when no rollback had taken place. (Bug#22728)
- If a table contains an `AUTO_INCREMENT` column, inserting into an insertable view on the table that does not include the `AUTO_INCREMENT` column should not change the value of `LAST_INSERT_ID()`, because the side effects of inserting default values into columns not part of the view should not be visible. MySQL was incorrectly setting `LAST_INSERT_ID()` to zero. (Bug#22584)
- Queries using a column alias in an expression as part of an `ORDER BY` clause failed, an example of such a query being `SELECT mycol + 1 AS mynum FROM mytable ORDER BY 30 - mynum`. (Bug#22457)
- Using `EXPLAIN` caused a server crash for queries that selected from `INFORMATION_SCHEMA` in a subquery in the `FROM` clause. (Bug#22413)
- Instance Manager had a race condition involving `mysqld` PID file removal. (Bug#22379)
- A server crash occurred when using `LOAD DATA` to load a table containing a `NOT NULL` spatial column, when the statement

did not load the spatial column. Now a `NULL supplied to NOT NULL column` error occurs. ([Bug#22372](#))

- The optimizer used the `ref` join type rather than `eq_ref` for a simple join on strings. ([Bug#22367](#))
- Some queries that used `MAX()` and `GROUP BY` could incorrectly return an empty result. ([Bug#22342](#))
- `DATE_ADD()` requires complete dates with no “zero” parts, but sometimes did not return `NULL` when given such a date. ([Bug#22229](#))
- If an `init_connect` SQL statement produced an error, the connection was silently terminated with no error message. Now the server writes a warning to the error log. ([Bug#22158](#))
- Some small double precision numbers (such as `1.00000001e-300`) that should have been accepted were truncated to zero. ([Bug#22129](#))
- For a nonexistent table, `DROP TEMPORARY TABLE` failed with an incorrect error message if `read_only` was enabled. ([Bug#22077](#))
- Trailing spaces were not removed from Unicode `CHAR` column values when used in indexes. This resulted in excessive usage of storage space, and could affect the results of some `ORDER BY` queries that made use of such indexes.

Note

When upgrading, it is necessary to re-create any existing indexes on Unicode `CHAR` columns in order to take advantage of the fix. This can be done by using a `REPAIR TABLE` statement on each affected table.

([Bug#22052](#))

- The code for generating `USE` statements for binary logging of `CREATE PROCEDURE` statements resulted in confusing output from `mysqlbinlog` for `DROP PROCEDURE` statements. ([Bug #Bug#22043](#))
- `STR_TO_DATE()` returned `NULL` if the format string contained a space following a non-format character. ([Bug#22029](#))
- Use of `PREPARE` with a `CREATE PROCEDURE` statement that contained a syntax error caused a server crash. ([Bug#21868](#))
- Use of a DES-encrypted SSL certificate file caused a server crash. ([Bug#21868](#))
- Adding a day, month, or year interval to a `DATE` value produced a `DATE`, but adding a week interval produced a `DATETIME` value. Now all produce a `DATE` value. ([Bug#21811](#))
- In some cases, the parser failed to distinguish a user-defined function from a stored function. ([Bug#21809](#))
- Use of a subquery that invoked a function in the column list of the outer query resulted in a memory leak. ([Bug#21798](#))
- Inserting a default or invalid value into a spatial column could fail with `Unknown error` rather than a more appropriate error. ([Bug#21790](#))
- It was possible to use `DATETIME` values whose year, month, and day parts were all zeroes but whose hour, minute, and second parts contained nonzero values, an example of such an illegal `DATETIME` being `'0000-00-00 11:23:45'`. ([Bug#21789](#))
- `yaSSL` crashed on pre-Pentium Intel CPUs. ([Bug #Bug#21765](#))
- Evaluation of subqueries that require the filesort algorithm were allocating and freeing the `sort_buffer_size` buffer many times, resulting in slow performance. Now the buffer is allocated once and reused. ([Bug#21727](#))
- Through the C API, the member strings in `MYSQL_FIELD` for a query that contains expressions may return incorrect results. ([Bug#21635](#))
- Selecting from a `MERGE` table could result in a server crash if the underlying tables had fewer indexes than the `MERGE` table itself. ([Bug#21617](#), [Bug#22937](#))
- Using `FLUSH TABLES` in one connection while another connection is using `HANDLER` statements caused a server crash. ([Bug#21587](#))
- View columns were always handled as having implicit derivation, leading to `illegal mix of collation errors` for some views in `UNION` operations. Now view column derivation comes from the original expression given in the view definition. ([Bug#21505](#))
- `InnoDB` crashed while performing XA recovery of prepared transactions. ([Bug#21468](#))
- `INET_ATON()` returned a signed `BIGINT` value, not an unsigned value. ([Bug#21466](#))

- After `FLUSH TABLES WITH READ LOCK` followed by `UNLOCK TABLES`, attempts to drop or alter a stored routine failed with an error that the routine did not exist, and attempts to execute the routine failed with a lock conflict error. (Bug#21414)
- It was possible to set the backslash character (“\”) as the delimiter character using `DELIMITER`, but not actually possible to use it as the delimiter. (Bug#21412)
- For multiple-table `UPDATE` statements, storage engines were not notified of duplicate-key errors. (Bug#21381)
- Within a prepared statement, `SELECT (COUNT(*) = 1)` (or similar use of other aggregate functions) did not return the correct result for statement re-execution. (Bug#21354)
- It was possible for a stored routine with a non-`latin1` name to cause a stack overrun. (Bug#21311)
- Certain malformed `INSERT` statements could crash the `mysql` client. (Bug#21142)
- Creating a `TEMPORARY` table with the same name as an existing table that was locked by another client could result in a lock conflict for `DROP TEMPORARY TABLE` because the server unnecessarily tried to acquire a name lock. (Bug#21096)
- Incorrect results could be obtained from re-execution of a parametrized prepared statement or a stored routine with a `SELECT` that uses `LEFT JOIN` with a second table having only one row. (Bug#21081)
- Within a stored routine, a view definition cannot refer to routine parameters or local variables. However, an error did not occur until the routine was called. Now it occurs during parsing of the routine creation statement.

Note

A side effect of this fix is that if you have already created such routines, an error will occur if you execute `SHOW CREATE PROCEDURE` or `SHOW CREATE FUNCTION`. You should drop these routines because they are erroneous.

(Bug#20953)

- In `mysql`, invoking `connect` or `\r` with very long `db_name` or `host_name` parameters caused buffer overflow. (Bug#20894)
- `SHOW VARIABLES` truncated the `Value` field to 256 characters. (Bug#20862)
- Selecting into variables sometimes returned incorrect wrong results. (Bug#20836)
- `WITH ROLLUP` could group unequal values. (Bug#20825)
- Range searches on columns with an index prefix could miss records. (Bug#20732)
- On slave servers, transactions that exceeded the lock wait timeout failed to roll back properly. (Bug#20697)
- Inserting `DEFAULT` into a column with no default value could result in garbage in the column. Now the same result occurs as when inserting `NULL` into a `NOT NULL` column. (Bug #Bug#20691)
- An `UPDATE` that referred to a key column in the `WHERE` clause and activated a trigger that modified the column resulted in a loop. (Bug#20670)
- `CONCURRENT` did not work correctly for `LOAD DATA INFILE`. (Bug#20637)
- `mysql_fix_privilege_tables.sql` altered the `table_privs.table_priv` column to contain too few privileges, causing loss of the `CREATE VIEW` and `SHOW VIEW` privileges. (Bug#20589)
- `LIKE` searches failed for indexed `utf8` character columns. (Bug#20471)
- With `lower_case_table_names` set to 1, `SHOW CREATE TABLE` printed incorrect output for table names containing Turkish I (LATIN CAPITAL LETTER I WITH DOT ABOVE). (Bug#20404)
- A query with a subquery that references columns of a view from the outer `SELECT` could return an incorrect result if used from a prepared statement. (Bug#20327)
- For queries that select from a view, the server was returning `MYSQL_FIELD` metadata inconsistently for view names and table names. For view columns, the server now returns the view name in the `table` field and, if the column selects from an underlying table, the table name in the `org_table` field. (Bug#20191)
- Invalidating the query cache caused a server crash for `INSERT INTO ... SELECT` statements that selected from a view. (Bug#20045)
- With `SQL_MODE=TRADITIONAL`, MySQL incorrectly aborted on warnings within stored routines and triggers. (Bug#20028)

- Unsigned `BIGINT` values treated as signed values by the `MOD ()` function. (Bug#19955)
- Compiling PHP 5.1 with the MySQL static libraries failed on some versions of Linux. (Bug#19817)
- The `DELIMITER` statement did not work correctly when used in an SQL file run using the `SOURCE` statement. (Bug#19799)
- `mysqldump --xml` produced invalid XML for `BLOB` data. (Bug#19745)
- Column names were not quoted properly for replicated views. (Bug#19736)
- For a cast of a `DATETIME` value containing microseconds to `DECIMAL`, the microseconds part was truncated without generating a warning. Now the microseconds part is preserved. (Bug#19491)
- `InnoDB`: Reduced optimization level for Windows 64 builds to handle possible memory overrun. (Bug#19424)
- SQL statements close to the size of `max_allowed_packet` could produce binary log events larger than `max_allowed_packet` that could not be read by slave servers. (Bug#19402)
- `VARBINARY` column values inserted on a MySQL 4.1 server had trailing zeroes following upgrade to MySQL 5.0 or later. (Bug#19371)
- `FLUSH INSTANCES` in Instance Manager triggered an assertion failure. (Bug#19368)
- For a debug server, a reference to an undefined user variable in a prepared statement executed with `EXECUTE` caused an assertion failure. (Bug#19356)
- The server could send incorrect column count information to the client for queries that produce a larger number of columns than can fit in a two-byte number. (Bug#19216)
- Within a trigger for a base table, selecting from a view on that base table failed. (Bug#19111)
- The value of the `warning_count` system variable was not being calculated correctly (also affecting `SHOW COUNT(*) WARNINGS`). (Bug#19024)
- For some problems relating to character set conversion or incorrect string values for `INSERT` or `UPDATE`, the server was reporting truncation or length errors instead. (Bug#18908)
- `DELETE IGNORE` could hang for foreign key parent deletes. (Bug#18819)
- Constant expressions and some numeric constants used as input parameters to user-defined functions were not treated as constants. (Bug#18761)
- `InnoDB` used table locks (not row locks) within stored functions. (Bug#18077)
- `myisampack` wrote to unallocated memory, causing a crash. (Bug#17951)
- `FLUSH LOGS` or `mysqladmin flush-logs` caused a server crash if the binary log was not open. (Bug#17733)
- `mysql_fix_privilege_tables` did not handle a password containing embedded space or apostrophe characters. (Bug#17700)
- `mysql` would lose its connection to the server if its standard output was not writable. (Bug#17583)
- Attempting to use a view containing `DEFINER` information for a non-existent user resulted in an error message that revealed the definer account. Now the definer is revealed only to superusers. Other users receive only an `access denied` message. (Bug#17254)
- `mysql-test-run` did not work correctly for RPM-based installations. (Bug#17194)
- `IN ()` and `CHAR ()` can return `NULL`, but did not signal that to the query processor, causing incorrect results for `IS NULL` operations. (Bug#17047)
- A client library crash was caused by executing a statement such as `SELECT * FROM t1 PROCEDURE ANALYSE ()` using a server side cursor on a table `t1` that does not have the same number of columns as the output from `PROCEDURE ANALYSE ()`. (Bug#17039)
- The `WITH CHECK OPTION` for a view failed to prevent storing invalid column values for `UPDATE` statements. (Bug#16813)
- Slave servers would retry the execution of a SQL statement an infinite number of times, ignoring the value `SLAVE_TRANSACTION_RETRIES` when using the `NDB` engine. (Bug#16228)
- `InnoDB` showed substandard performance with multiple queries running concurrently. (Bug#15815)

- `ALTER TABLE` was not able to rename a view. (Bug#14959)
- Statements such as `DROP PROCEDURE` and `DROP VIEW` were written to the binary log too late due to a race condition. (Bug#14262)
- A literal string in a `GROUP BY` clause could be interpreted as a column name. (Bug#14019)
- Instance Manager didn't close the client socket file when starting a new `mysqld` instance. `mysqld` inherited the socket, causing clients connected to Instance Manager to hang. (Bug#12751)
- Entries in the slow query log could have an incorrect `Rows_examined` value. (Bug#12240)
- Warnings were generated when explicitly casting a character to a number (for example, `CAST('x' AS SIGNED)`), but not for implicit conversions in simple arithmetic operations (such as `'x' + 0`). Now warnings are generated in all cases. (Bug#11927)
- Lack of validation for input and output `TIME` values resulted in several problems: `SEC_TO_TIME()` within subqueries incorrectly clipped large values; `SEC_TO_TIME()` treated `BIGINT UNSIGNED` values as signed; only truncation warnings were produced when both truncation and out-of-range `TIME` values occurred. (Bug#11655, Bug#20927)
- Metadata for columns calculated from scalar subqueries was limited to integer, double, or string, even if the actual type of the column was different. (Bug#11032)
- Several string functions could return incorrect results when given very large length arguments. (Bug#10963)
- A locking safety check in InnoDB reported a spurious error `stored_select_lock_type is 0 inside ::start_stmt()` for `INSERT ... SELECT` statements in `innodb_locks_unsafe_for_binlog` mode. The safety check was removed. (Bug#10746)
- `FROM_UNIXTIME()` did not accept arguments up to `POWER(2, 31)-1`, which it had previously. (Bug#9191)
- Subqueries of the form `NULL IN (SELECT ...)` returned invalid results. (Bug#8804, Bug#23485)
- `OPTIMIZE TABLE` with `myisam_repair_threads > 1` could result in MyISAM table corruption. (Bug#8283)
- Transient errors in replication from master to slave may trigger multiple `Got fatal error 1236: 'binlog truncated in the middle of event'` errors on the slave. (Bug#4053)

D.1.5. Release Notes for MySQL Community Server 5.0.27 (21 October 2006)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.26.

Functionality added or changed:

- This is the last version for which binary MySQL-Max distributions are available, except for RPM distributions. (For RPM distributions, the last version is 5.0.37.)

Bugs fixed:

- MySQL 5.0.26 introduced an ABI incompatibility, which this release reverts. Programs compiled against 5.0.26 are not compatible with any other version and must be recompiled. (Bug #Bug#23427)

Appendix E. MySQL Change History

Note

This appendix lists the changes from version to version in the MySQL 5.0 source code through MySQL 5.0.26. For changes made to versions following 5.0.26, see [Appendix C, MySQL Enterprise Release Notes](#), and [Appendix D, MySQL Community Server Enhancements and Release Notes](#).

Starting with MySQL 5.0, we began offering a new version of the Manual for each new series of MySQL releases (5.0, 5.1, and so on). For information about changes in previous release series of the MySQL database software, see the corresponding version of this Manual. For information about legacy versions of the MySQL software through the 4.1 series, see *MySQL 3.23, 4.0, 4.1 Reference Manual*.

We update this section as we add new features in the 5.0 series, so that everybody can follow the development process.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (<http://dev.mysql.com/downloads/>), it means that the version has not yet been released.

The date mentioned with a release version is the date of the last BitKeeper ChangeSet on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

The manual included in the source and binary distributions may not be fully accurate when it comes to the release changelog entries, because the integration of the manual happens at build time. For the most up-to-date release changelog, please refer to the online version instead.

E.1. Changes in release 5.0.x (Production)

The following changelog shows what has been done in the 5.0 tree:

- Basic support for read-only server side cursors. For information about using cursors within stored routines, see [Section 18.2.9, “Cursors”](#). For information about using cursors from within the C API, see [Section 23.2.7.3, “mysql_stmt_attr_set\(\)”](#).
- Basic support for (updatable) views. See, for example, [Section 20.2, “CREATE VIEW Syntax”](#).
- Basic support for stored procedures and functions (SQL:2003 style). See [Chapter 18, Stored Procedures and Functions](#).
- Initial support for rudimentary triggers.
- Added `SELECT INTO list_of_vars`, which can be of mixed (that is, global and local) types. See [Section 18.2.7.3, “SELECT ... INTO Statement”](#).
- Removed the update log. It is fully replaced by the binary log. If the MySQL server is started with `--log-update`, it is translated to `--log-bin` (or ignored if the server is explicitly started with `--log-bin`), and a warning message is written to the error log. Setting `SQL_LOG_UPDATE` silently sets `SQL_LOG_BIN` instead (or do nothing if the server is explicitly started with `--log-bin`).
- Support for the `ISAM` storage engine has been removed. If you have `ISAM` tables, you should convert them before upgrading. See [Section 2.4.17.2, “Upgrading from MySQL 4.1 to 5.0”](#).
- Support for `RAID` options in `MyISAM` tables has been removed. If you have tables that use these options, you should convert them before upgrading. See [Section 2.4.17.2, “Upgrading from MySQL 4.1 to 5.0”](#).
- User variable names are now case insensitive: If you do `SET @a=10;` then `SELECT @A;` now returns `10`. Case sensitivity of a variable's value depends on the collation of the value.
- Strict mode, which in essence means that you get an error instead of a warning when inserting an incorrect value into a column. See [Section 5.2.6, “SQL Modes”](#).
- `VARCHAR` and `VARBINARY` columns remember end space. A `VARCHAR()` or `VARBINARY` column can contain up to 65,535 characters or bytes, respectively.
- `MEMORY (HEAP)` tables can have `VARCHAR` columns.
- When using a constant string or a function that generates a string result in `CREATE ... SELECT`, MySQL creates the result column based on the maximum length of the string or expression:

Maximum Length	Data type
= 0	CHAR(0)
< 512	VARCHAR(max_length)
>= 512	TEXT

- A fixed-point math library is introduced that supports precision math, resulting in more accurate results when working with the `DECIMAL` and `NUMERIC` data types. For details, see [Chapter 22, Precision Math](#).

For a full list of changes, please refer to the changelog sections for each individual 5.0.x release.

E.1.1. Changes for release 5.0.27 and up

Beginning with MySQL 5.0.27, change notes are listed separately for MySQL Enterprise and MySQL Community Server. See [Appendix C, MySQL Enterprise Release Notes](#), and [Appendix D, MySQL Community Server Enhancements and Release Notes](#).

E.1.2. Changes in MySQL 5.0.26 (03 October 2006)

This is a bugfix release for the current production release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- The number of `InnoDB` threads is no longer limited to 1,000 on Windows. ([Bug#22268](#))
- `mysqldump` now has a `--flush-privileges` option. It causes `mysqldump` to emit a `FLUSH PRIVILEGES` statement after dumping the `mysql` database. This option should be used any time the dump contains the `mysql` database and any other database that depends on the data in the `mysql` database for proper restoration. ([Bug#21424](#))
- The output generated by the server when using the `--xml` option has changed with regard to null values. It now matches the output from `mysqldump --xml`. That is, a column containing a `NULL` value is now reported as

```
<field name="column_name" xsi:nil="true" />
```

whereas a column containing the string value 'NULL' is reported as

```
<field name="column_name">NULL</field>
```

and a column containing an empty string is reported as

```
<field name="column_name">>/field>
```

([Bug#21263](#))

- The source distribution has been updated so that the UDF example can be compiled under Windows with CMake. See [Section 26.2.4.5, "Compiling and Installing User-Defined Functions"](#). ([Bug#19121](#))
- `LOAD DATA INFILE` no longer causes an implicit commit for all storage engines. It now causes an implicit commit only for tables using the `NDB` storage engine. ([Bug#11151](#))
- The `LOAD DATA FROM MASTER` and `LOAD TABLE FROM MASTER` statements are deprecated. See [Section 12.6.2.2, "LOAD DATA FROM MASTER Syntax"](#), for recommended alternatives. ([Bug#9125](#), [Bug#20596](#), [Bug#14399](#), [Bug#12187](#), [Bug#15025](#), [Bug#18822](#))

Bugs fixed:

- Deleting entries from a large `MyISAM` index could cause index corruption when it needed to shrink. Deletes from an index can happen when a record is deleted, when a key changes and must be moved, and when a key must be un-inserted because of a du-

uplicate key. This can also happen in `REPAIR TABLE` when a duplicate key is found and in `myisamchk` when sorting the records by an index. (Bug#22384)

- `yaSSL` had a conflicting definition for `socklen_t` on `hurd-i386` systems. (Bug#22326)
- `mysql_ftdump` produced bad counts for common words. (Bug#22326)
- Conversion of values inserted into a `BIT` column could affect adjacent columns. (Bug#22271)
- `mysql_com.h` unnecessarily referred to the `ulong` type. (Bug#22227)
- The source distribution would not build on Windows due to a spurious dependency on `ib_config.h`. (Bug#22224)
- Execution of a prepared statement that uses an `IN` subquery with aggregate functions in the `HAVING` clause could cause a server crash. (Bug#22085)
- Using `GROUP_CONCAT()` on the result of a subquery in the `FROM` clause that itself used `GROUP_CONCAT()` could cause a server crash. (Bug#22015)
- A query that used `GROUP BY` and an `ALL` or `ANY` quantified subquery in a `HAVING` clause could trigger an assertion failure. (Bug#21853)
- `UPGRADE` was treated as a reserved word, although it is not. (Bug#21772)
- The value of `LAST_INSERT_ID()` was not always updated correctly within stored routines. (Bug#21726)
- A function result in a comparison was replaced with a constant by the optimizer under some circumstances when this optimization was invalid. (Bug#21698)
- If `mysqld` was linked against a system-installed `zlib` library compiled without large-file support, it would likely exit with a `SIGXFSZ` (file size exceeded) signal if an `ARCHIVE` table reached 2GB. The server now checks for space before writing. (Bug#21675)
- The presence of a subquery in the `ON` clause of a join in a view definition prevented the `MERGE` algorithm from being used for the view in cases where it should be allowed. (Bug#21646)
- When records are merged from the insert buffer and the page needs to be reorganized, `InnoDB` used incorrect column length information when interpreting the records of the page. This caused a server crash due to apparent corruption of secondary indexes in `ROW_FORMAT=COMPACT` that contain prefix indexes of fixed-length columns. Data files should not be corrupted, but the crash was likely to repeat every time the server was restarted. (Bug#21638)
- For character sets having a `mbmaxlen` value of 2, any `ALTER TABLE` statement changed `TEXT` columns to `MEDIUMTEXT`. (Bug#21620)
- `mysql` displayed an empty string for `NULL` values. (Bug#21618)
- Selecting from a `MERGE` table could result in a server crash if the underlying tables had fewer indexes than the `MERGE` table itself. (Bug#21617, Bug#22937)
- For `INSERT ... ON DUPLICATE KEY UPDATE`, use of `VALUES(col_name)` within the `UPDATE` clause sometimes was handled incorrectly. (Bug#21555)
- Subqueries with aggregate functions but no `FROM` clause could return incorrect results. (Bug#21540)
- The server could crash for the second execution of a function containing a `SELECT` statement that uses an aggregating `IN` subquery. (Bug#21493)
- The URL into the online manual that is printed in the stack trace message by the server was out of date. (Bug#21449)
- Table aliases in multiple-table `DELETE` statements sometimes were not resolved. (Bug#21392)
- `mysql_config --libmysqld-libs` did not produce any SSL options necessary for linking `libmysqld` with SSL support enabled. (Bug#21239)
- In the package of pre-built time zone tables that is available for download at timezones.html, the tables now explicitly use the `utf8` character set so that they work the same way regardless of the system character set value. (Bug#21208)
- A subquery that uses an index for both the `WHERE` and `ORDER BY` clauses produced an empty result. (Bug#21180)
- `mysql_upgrade` produced a malformed `upgrade_defaults` file by overwriting the `[client]` group header with a `password` option. This prevented `mysqlcheck` from running successfully when invoked by `mysql_upgrade`.

[Bug#21011](#))

- On Windows, inserting into a `MERGE` table after renaming an underlying `MyISAM` table caused a server crash. ([Bug#20789](#))
- Within stored routines, some error messages were printed incorrectly. A non-null-terminated string was passed to a message-printing routine that expected a null-terminated string. ([Bug#20778](#))
- `INSERT DELAYED` did not honor `SET INSERT_ID` or the `auto_increment_*` system variables. ([Bug#20627](#), [Bug#20830](#))
- If the `auto_increment_offset` setting causes MySQL to generate a value larger than the column's maximum possible value, the `INSERT` statement is accepted in strict SQL mode, whereas but should fail with an error. ([Bug#20573](#))
- Usernames have a maximum length of 16 characters (even if they contain multi-byte characters), but were being truncated to 16 bytes. ([Bug#20393](#))
- `PROCEDURE ANALYSE()` returned incorrect values of `MFLOAT(M, D)` and `DOUBLE(M, D)`. ([Bug#20305](#))
- For a `MyISAM` table locked with `LOCK TABLES ...WRITE`, queries optimized using the `index_merge` method did not show rows inserted with the lock in place. ([Bug#20256](#))
- `SUBSTR()` results sometimes were stored improperly into a temporary table when multi-byte character sets were used. ([Bug#20204](#))
- For an `ENUM` column that used the `ucs2` character set, using `ALTER TABLE` to modify the column definition caused the default value to be lost. ([Bug#20108](#))
- Join conditions using index prefixes on `utf8` columns of `InnoDB` tables incorrectly ignored rows where the length of the actual value was greater than the length of the index prefix. ([Bug#19960](#))
- `make install` tried to build files that should already have been built by `make all`, causing a failure if installation was performed using a different account than the one used for the initial build. ([Bug#19738](#))
- For a `MyISAM` table with a `FULLTEXT` index, compression with `myisampack` or a check with `myisamchk` after compression resulted in table corruption. ([Bug#19702](#))
- Column names supplied for a view created on a master server could be lost on a slave server. ([Bug#19419](#))
- The build process incorrectly tried to overwrite `sql/lex_hash.h`. This caused the build to fail when using a shadow link tree pointing to original sources that were owned by another account. ([Bug#18888](#))
- Linking the `pthread` library to single-threaded MySQL libraries caused `dlopen()` to fail at runtime on HP-UX. ([Bug#18267](#))
- The source distribution failed to compile when configured with the `--with-libwrap` option. ([Bug#18246](#))
- Queries containing a subquery that used aggregate functions could return incorrect results. ([Bug#16792](#))
- Row equalities (such as `WHERE (a,b) = (c,d)`) were not taken into account by the optimizer, resulting in slow query execution. Now they are treated as conjunctions of equalities between row elements. ([Bug#16081](#))
- `BIN()`, `OCT()`, and `CONV()` did not work with `BIT` values. ([Bug#15583](#))
- The parser rejected queries that selected from a table twice using a `UNION` within a subquery. The parser now supports arbitrary subquery, join, and parenthesis operations within `EXISTS` subqueries. A limitation still exists for scalar subqueries: If the subquery contains `UNION`, the first `SELECT` of the `UNION` cannot be within parentheses. For example, `SELECT (SELECT a FROM t1 UNION SELECT b FROM t2)` will work, but `SELECT ((SELECT a FROM t1) UNION (SELECT b FROM t2))` will not. ([Bug#14654](#))
- The source distribution failed to compile when configured with the `--without-geometry` option. ([Bug#12991](#))
- On Mac OS X, zero-byte `read()` or `write()` calls to an SMB-mounted filesystem could return a non-standard return value, leading to data corruption. Now such calls are avoided. ([Bug#12620](#))
- The server returns a more informative error message when it attempts to open a `MERGE` table that has been defined to use non-`MyISAM` tables. ([Bug#10974](#))
- With `TRADITIONAL` SQL mode, assignment of out-of-bound values and rounding of assigned values was done correctly, but assignment of the same numbers represented as strings sometimes was handled differently. ([Bug#6147](#))
- On an `INSERT` into an updatable but non-insertable view, an error message was issued stating that the view was not updatable.

Now the message says the view is not insertable-into. (Bug#5505)

- `EXPLAIN` sometimes returned an incorrect `select_type` for a `SELECT` from a view, compared to the `select_type` for the equivalent `SELECT` from the base table. (Bug#5500)
- Incorporated some portability fixes into the definition of `__attribute__` in `my_global.h`. (Bug#2717)

E.1.3. Changes in MySQL 5.0.25 (15 September 2006)

End of Product Lifecycle

Active development and support for MySQL database server versions 3.23, 4.0, and 4.1 has ended. However, for MySQL 4.0 and 4.1, there is still extended support available. For details, see <http://www.mysql.com/company/legal/lifecycle/#calendar>. According to the MySQL Lifecycle Policy (see <http://www.mysql.com/company/legal/lifecycle/#policy>), only Security and Severity Level 1 issues will still be fixed for MySQL 4.0 and 4.1. Please consider upgrading to a recent version (MySQL 5.0 or 5.1).

This is a bugfix release for the current production release family. This version was released as MySQL Classic 5.0.25 to commercial customers only.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- MySQL now can do stack dumps on `x86_64` and `i386/NPTL` systems. (Bug#21250)
- The `mysqld` and `mysqlmanager` manpages have been reclassified from volume 1 to volume 8. (Bug#21220)
- `TIMESTAMP` columns that are `NOT NULL` now are reported that way by `SHOW COLUMNS` and `INFORMATION_SCHEMA`. (Bug#20910)
- The MySQL distribution now compiles on UnixWare 7.13. (Bug#20190)
- `configure` now defines the symbol `DEBUG_ON` in `config.h` to indicate whether the source tree is configured to be compiled with debugging support. (Bug#19517)
- `mysql_upgrade` no longer reads the `[client]` option file group because it is not a client and did not understand client options such as `host`. Now it reads only the `[mysql_upgrade]` group. (Bug#19452)
- For `mysqlshow`, if a database name argument contains wildcard characters (such as “`_`”) but matches a single database name exactly, treat the name as a literal name. This allows a command such as `mysqlshow information_schema` work without having to escape the wildcard character. (Bug#19147)
- For the `mysql` client, typing Control-C causes `mysql` to attempt to kill the current statement. If this cannot be done, or Control-C is typed again before the statement is killed, `mysql` exits. Previously, Control-C caused `mysql` to exit in all cases. (Bug#17926, Bug#1989)
- The `VIEW_DEFINITION` column of the `INFORMATION_SCHEMA VIEWS` table now contains information about the view algorithm. (Bug#16832)
- The bundled yaSSL library licensing has added a FLOSS exception similar to MySQL to resolve licensing incompatibilities with MySQL. (See the `extra/yassl/FLOSS-EXCEPTIONS` file in a MySQL source distribution for details.) (Bug#16755)
- If a `DROP VIEW` statement named multiple views, it stopped with an error if a non-existent view was named and did not drop the remaining views. Now it continues on and reports an error at the end, similar to `DROP TABLE`. (Bug#16614)
- Table comments longer than 60 characters and column comments longer than 255 characters were truncated silently. Now a warning is issued, or an error in strict mode. (Bug#13934)
- The `mysql` client used the default character set if it automatically reconnected to the server, which is incorrect if the character set had been changed. To enable the character set to remain synchronized on the client and server, the `mysql` command `charset` (or `\C`) that changes the default character set and now also issues a `SET NAMES` statement. The changed character set is used for reconnects. (Bug#11972)
- The server now issues a warning if it removes leading spaces from an alias. (Bug#10977)

- For a successful dump, `mysqldump` now writes a SQL comment to the end of the dump file in the following format:

```
-- Dump completed on YYYY-MM-DD hh:mm:ss
```

([Bug#10877](#))

- For spatial data types, the server formerly returned these as `VARSTRING` values with a binary collation. Now the server returns spatial values as `BLOB` values. ([Bug#10166](#))
- A new system variable, `lc_time_names`, specifies the locale that controls the language used to display day and month names and abbreviations. This variable affects the output from the `DATE_FORMAT()`, `DAYNAME()` and `MONTHNAME()` functions. See [Section 5.10.9, “MySQL Server Locale Support”](#).
- Using `--with-debug` to configure MySQL with debugging support enables you to use the `--debug="d,parser_debug"` option when you start the server. This causes the Bison parser that is used to process SQL statements to dump a parser trace to the server's standard error output. Typically, this output is written to the error log.
- The bundled yaSSL library was upgraded to version 1.3.7.

Bugs fixed:

- **Security Fix:** A stored routine created by one user and then made accessible to a different user using `GRANT EXECUTE` could be executed by that user with the privileges of the routine's definer. ([Bug#26844](#), [CVE-2006-4227](#))
- **Security Fix:** On Linux, and possibly other platforms using case-sensitive filesystems, it was possible for a user granted rights on a database to create or access a database whose name differed only from that of the first by the case of one or more letters. ([Bug#17647](#), [CVE-2006-4226](#))
- **MySQL Cluster:** Setting `TransactionDeadlockDetectionTimeout` to a value greater than 12000 would cause scans to deadlock, time out, fail to release scan records, until the cluster ran out of scan records and stopped processing. ([Bug#21800](#))
- **MySQL Cluster:** (Direct APIs): Invoking the MGM API function `ndb_mgm_listen_event()` caused a memory leak. ([Bug#21671](#))
- **MySQL Cluster:** The server provided a non-descriptive error message when encountering a fatally corrupted REDO log. ([Bug#21615](#))
- **MySQL Cluster:** A partial rollback could lead to node restart failures. ([Bug#21536](#))
- **MySQL Cluster:** The failure of a unique index read due to an invalid schema version could be handled incorrectly in some cases, leading to unpredictable results. ([Bug#21384](#))
- **MySQL Cluster:** In a cluster with more than 2 replicas, a manual restart of one of the data nodes could fail and cause the other nodes in its nodegroup to shut down. ([Bug#21213](#))
- **MySQL Cluster:** (Direct APIs): The MGM API function `ndb_logevent_get_fd()` was not actually implemented. ([Bug#21129](#))
- **MySQL Cluster:** Some queries involving joins on very large NDB tables could crash the MySQL server. ([Bug#21059](#))
- **MySQL Cluster:** Restarting a data node while DDL operations were in progress on the cluster could cause other data nodes to fail. This could also lead to `mysqld` hanging or crashing under some circumstances. ([Bug#21017](#), [Bug#21050](#))
- **MySQL Cluster:** In some situations with a high disk-load, writing of the redo log could hang, causing a crash with the error message `GCP STOP DETECTED`. ([Bug#20904](#))
- **MySQL Cluster:** When the redo buffer ran out of space, a `POINTER TOO LARGE` error was raised and the cluster could become unusable until restarted with `--initial`. ([Bug#20892](#))
- **MySQL Cluster:** A vague error message was returned when reading of both schema files occurred during a restart of the cluster. ([Bug#20860](#))
- **MySQL Cluster:** Incorrect values were inserted into `AUTO_INCREMENT` columns of tables restored from a cluster backup. ([Bug#20820](#))
- **MySQL Cluster:** When attempting to restart the cluster following a data import, the cluster would fail during Phase 4 of the restart with `ERROR 2334: JOB BUFFER CONGESTION`. ([Bug#20774](#))
- **MySQL Cluster:** `REPLACE` statements did not work correctly on an NDB table having both a primary key and a unique key. In

such cases, proper values were not set for columns which were not explicitly referenced in the statement. (Bug#20728)

- **MySQL Cluster:** The server did not honor the value set for `ndb_cache_check_time` in the `my.cnf` file. (Bug#20708)
- **MySQL Cluster:** (Replication): In some cases, a large number of MySQL servers sending requests to the cluster simultaneously could cause the cluster to crash. This could also be triggered by many NDB API clients making simultaneous event subscriptions or unsubscriptions. (Bug#20683)
- **MySQL Cluster:** `ndb_size.pl` and `ndb_error_reporter` were missing from RPM packages. (Bug#20426)
- **MySQL Cluster:** Running `ndbd --nowait-nodes=id` where `id` was the node ID of a node that was already running would fail with an invalid error message. (Bug#20419)
- **MySQL Cluster:** (Direct APIs): `NdbScanOperation::readTuples()` and `NdbIndexScanOperation::readTuples()` ignored the `batch` parameter. (Bug#20252)
- **MySQL Cluster:** A node failure during a scan could sometime cause the node to crash when restarting too quickly following the failure. (Bug#20197)
- **MySQL Cluster:** It was possible to use port numbers greater than 65535 for `ServerPort` in the `config.ini` file. (Bug#19164)
- **MySQL Cluster:** Under certain circumstances, a node that was shut down then restarted could hang during the restart. (Bug#18863)
- **MySQL Cluster:** Trying to create or drop a table while a node was restarting caused the node to crash. This is now handled by raising an error. (Bug#18781)
- **MySQL Cluster:** The server failed with a non-descriptive error message when out of data memory. (Bug#18475)
- **MySQL Cluster:** `SELECT ... FOR UPDATE` failed to lock the selected rows. (Bug#18184)
- **MySQL Cluster:** A Cluster whose storage nodes were installed from the `MySQL-ndb-storage-*` RPMs could not perform `CREATE` or `ALTER` operations that made use of non-default character sets or collations. (Bug#14918)
- **MySQL Cluster:** The management client `ALL STATUS` command could sometimes report the status of some data nodes incorrectly. (Bug#13985)
- **MySQL Cluster:** An issue that arose from a patch for Bug#19852 made in MySQL 5.0.23 was corrected. (See Section E.1.6, “Changes in MySQL 5.0.23 (Not released)”.)
- For ODBC compatibility, MySQL supports use of `WHERE col_name IS NULL` for `DATE` or `DATETIME` columns that are `NOT NULL`, to allow column values of `'0000-00-00'` or `'0000-00-00 00:00:00'` to be selected. However, this was not working for `WHERE` clauses in `DELETE` statements. (Bug#23412)
- Some Linux-x86_64-icc packages (of previous releases) mistakenly contained 32-bit binaries. Only `ICC` builds are affected, not `gcc` builds. Solaris and FreeBSD x86_64 builds are not affected. (Bug#22238)
- Running `SHOW MASTER LOGS` at the same time as binary log files were being switched would cause `mysqld` to hang. (Bug#21965)
- `libmysqlclient` defined a symbol `BN_bin2bn` which belongs to OpenSSL. This could break applications that also linked against OpenSSL's `libcrypto` library. The fix required correcting an error in a build script that was failing to add rename macros for some functions. (Bug#21930)
- `character_set_results` can be `NULL` to signify “no conversion,” but some code did not check for `NULL`, resulting in a server crash. (Bug#21913)
- A `NUL` byte within a prepared statement string caused the rest of the string not to be written to the query log, allowing logging to be bypassed. (Bug#21813)
- `COUNT(*)` queries with `ORDER BY` and `LIMIT` could return the wrong result.

Note

This problem was introduced by the fix for Bug#9676, which limited the rows stored in a temporary table to the `LIMIT` clause. This optimization is not applicable to non-group queries with aggregate functions. The current fix disables the optimization in such cases.

(Bug#21787)

- `INSERT ... SELECT` sometimes generated a spurious `Column count doesn't match value count` error. (Bug#21774)
- A memory leak was found when running `ndb_mgm -e "SHOW"`. (Bug#21670)
- `EXPORT_SET()` did not accept arguments with coercible character sets. (Bug#21531)
- `mysqldump` incorrectly tried to use `LOCK TABLES` for tables in the `INFORMATION_SCHEMA` database. (Bug#21527)
- Memory overruns could occur for certain kinds of subqueries. (Bug#21477)
- A `DATE` can be represented as an integer (such as `20060101`) or as a string (such as `'2006.01.01'`). When a `DATE` (or `TIME`) column is compared in one `SELECT` against both representations, constant propagation by the optimizer led to comparison of `DATE` as a string against `DATE` as an integer. This could result in integer comparisons such as `2006` against `20060101`, erroneously producing a false result. (Bug#21475)
- Adding `ORDER BY` to a `SELECT DISTINCT(expr)` query could produce incorrect results. (Bug#21456)
- Database and table names have a maximum length of 64 characters (even if they contain multi-byte characters), but were being truncated to 64 bytes. This patch was reverted in MySQL 5.0.26. (Bug#21432)
- With `max_sp_recursion` set to 0, a stored procedure that executed a `SHOW CREATE PROCEDURE` statement for itself triggered a recursion limit exceeded error, though the statement involves no recursion. (Bug#21416)
- On 64-bit Windows, a missing table generated error 1017, not the correct value of 1146. (Bug#21396)
- The optimizer sometimes produced an incorrect row-count estimate after elimination of `const` tables. This resulted in choosing extremely inefficient execution plans in some cases when distribution of data in joins were skewed. (Bug#21390)
- A query result could be sorted improperly when using `ORDER BY` for the second table in a join. (Bug#21302)
- Query results could be incorrect if the `WHERE` clause contained `t.key_part NOT IN (val_list)`, where `val_list` is a list of more than 1000 constants. (Bug#21282)
- For user-defined functions created with `CREATE FUNCTION`, the `DEFINER` clause is not legal, but no error was generated. (Bug#21269)
- The `SELECT` privilege was required for an insert on a view, instead of the `INSERT` privilege. (Bug#21261)
This regression was introduced by Bug#20989
- Subqueries on `INFORMATION_SCHEMA` tables could erroneously return an empty result. (Bug#21231)
- `mysql_upgrade` created temporary files in a possibly insecure way. (Bug#21224)
- When `DROP DATABASE` or `SHOW OPEN TABLES` was issued while concurrently issuing `DROP TABLE` (or `RENAME TABLE`, `CREATE TABLE LIKE` or any other statement that required a name lock) in another connection, the server crashed. (Bug#21216)
- The `--master-data` option for `mysqldump` requires certain privileges, but `mysqldump` generated a truncated dump file without producing an appropriate error message or exit status if the invoking user did not have those privileges. (Bug#21215)
- `InnoDB` did not honor `IGNORE INDEX`, which prevented using `IGNORE INDEX` in cases where an index sort would be slower than a filesort. This patch was reverted in MySQL 5.0.26. Hint operation was revised further in MySQL 5.0.40. (Bug#21174)
- Some prepared statements caused a server crash when executed a second time. (Bug#21166)
- The optimizer assumed that if `(a=x AND b=x)` is true, `(a=x AND b=x) AND a=b` is also true. But that is not always so if `a` and `b` have different data types. (Bug#21159)
- `SHOW INNODB STATUS` contained some duplicate output. (Bug#21113)
- `InnoDB` was slow with more than 100,000 `.idb` files. (Bug#21112)
- Performing an `INSERT` on a view that was defined using a `SELECT` that specified a collation and a column alias caused the server to crash. (Bug#21086)
- `ALTER VIEW` did not retain existing values of attributes that had been originally specified but were not changed in the `ALTER VIEW` statement. (Bug#21080)

- For `InnoDB` tables, the server could crash when executing `NOT IN ()` subqueries. (Bug#21077)
- The `ndb_mgm` program was included in both the `MySQL-ndb-tools` and `MySQL-ndb-management` RPM packages, resulting in a conflict if both were installed. Now `ndb_mgm` is included only in `MySQL-ndb-tools`. (Bug#21058)
- The `mysam_stats_method` variable was mishandled when set from an option file or on the command line. (Bug#21054)
- With `query_cache_type` set to 0, `RESET QUERY CACHE` was very slow and other threads were blocked during the operation. Now a cache reset is faster and non-blocking. (Bug#21051)
- `mysql` crashed for very long arguments to the `connect` command. (Bug#21042)
- A query using `WHERE column = constant OR column IS NULL` did not return consistent results on successive invocations. The `column` in each part of the `WHERE` clause could be either the same column, or two different columns, for the effect to be observed. (Bug#21019)
- Successive invocations of a `COUNT(*)` query containing a join on two `MyISAM` tables and a `WHERE` clause of the form `WHERE (table1.column1 = table2.column2) OR table2.column2 IS NULL` yielded different results. (Bug#21019)
- Performance during an import on a table with a trigger that called a stored procedure was severely degraded. This issue first arose in MySQL 5.0.18. (Bug#21013)
- A query of the form shown here caused the server to crash:

```
SELECT * FROM t1 NATURAL JOIN (
  t2 JOIN (
    t3 NATURAL JOIN t4,
    t5 NATURAL JOIN t6
  )
  ON (t3.id3 = t2.id3 AND t5.id5 = t2.id5)
);
```

(Bug#21007)

- `STR_TO_DATE()` sometimes would return `NULL` if the `%D` format specifier was not the last specifier in the format string. (Bug#20987)
- A query using `WHERE NOT (column < ANY (subquery))` yielded a different result from the same query using the same `column` and `subquery` with `WHERE (column > ANY (subquery))`. (Bug#20975)
- In debugging mode, `mysqld` printed `server_init` rather than `network_init` during network initialization. (Bug#20968)
- Under certain circumstances, `AVG(key_val)` returned a value but `MAX(key_val)` returned an empty set due to incorrect application of `MIN()/MAX()` optimization. (Bug#20954)
- On Windows, `mysql_upgrade.exe` could not find `mysqlcheck.exe`. (Bug#20950)
- Use of zero-length variable names caused a server crash. (Bug#20908)
- The server crashed when using the range access method to execute a subquery with a `ORDER BY DESC` clause. (Bug#20869)
- For certain queries, the server incorrectly resolved a reference to an aggregate function and crashed. (Bug#20868)
- Using aggregate functions in subqueries yielded incorrect results under certain circumstances due to incorrect application of `MIN()/MAX()` optimization. (Bug#20792)
- If a column definition contained a character set declaration, but a `DEFAULT` value began with an introducer, the introducer character set was used as the column character set. (Bug#20695)
- Multiplication of `DECIMAL` values could produce incorrect fractional part and trailing garbage caused by signed overflow. (Bug#20569)
- Users who had the `SHOW VIEW` privilege for a view and privileges on one of the view's base table could not see records in `INFORMATION_SCHEMA` tables relating to the base table. (Bug#20543)
- The `MD5()`, `SHA1()`, and `ENCRYPT()` functions should return a binary string, but the result sometimes was converted to the character set of the argument. `MAKE_SET()` and `EXPORT_SET()` now use the correct character set for their default separators, resulting in consistent result strings which can be coerced according to normal character set rules. (Bug#20536)
- A subquery that contained `LIMIT N, 1` could return more than one row. (Bug#20519)

- Creation of a view as a join of views or tables could fail if the views or tables are in different databases. ([Bug#20482](#))
- `SELECT` statements using `GROUP BY` against a view could have missing columns in the output when there was a trigger defined on one of the base tables for the view. ([Bug#20466](#))
- `CREATE PROCEDURE`, `CREATE FUNTION`, `CREATE TRIGGER`, and `CREATE VIEW` statements containing multi-line comments (`/* ... */`) could not be replicated. ([Bug#20438](#))
- For connections that required a `SUBJECT` value, a check was performed to verify that the value was correct, but the connection was not refused if not. ([Bug#20411](#))
- Some user-level errors were being written to the server's error log, which is for server errors. ([Bug#20402](#))
- `perorr` crashed on Solaris due to `NULL` return value of `strerror()` system call. ([Bug#20145](#))
- For `mysql`, escaping with backslash sometimes did not work. ([Bug#20103](#))
- Use of `MIN()` or `MAX()` with `GROUP BY` on a `ucs2` column could cause a server crash. ([Bug#20076](#))
- `mysqld --flush` failed to flush `MyISAM` table changes to disk following an `UPDATE` statement for which no updated column had an index. ([Bug#20060](#))
- A user-defined function that is called on each row of a returned result set, could receive an `in_null` state that is set, if it was set previously. Now, the `is_null` state is reset to false before each invocation of a UDF. ([Bug#19904](#))
- The `query` command for `mysqltest` did not work. ([Bug#19890](#))
- When executing a `SELECT` with `ORDER BY` on a view that is constructed from a `SELECT` statement containing a stored function, the stored function was evaluated too many times. ([Bug#19862](#))
- The first time a user who had been granted the `CREATE ROUTINE` privilege used that privilege to create a stored function or procedure, the `Password` column in that user's row in the `mysql.user` table was set to `NULL`. ([Bug#19857](#))
- For `TIME_FORMAT()`, the `%H` and `%k` format specifiers can return values larger than two digits (if the hour is greater than 99), but for some query results that contained three-character hours, column values were truncated. ([Bug#19844](#))
- Using `SELECT` on a corrupt `MyISAM` table using the dynamic record format could cause a server crash. ([Bug#19835](#))
- Using cursors with `READ COMMITTED` isolation level could cause `InnoDB` to crash. ([Bug#19834](#))
- The `yaSSL` library bundled with `libmysqlclient` had some conflicts with `OpenSSL`. Now macros are used to rename the conflicting symbols to have a prefix of `ya`. ([Bug#19810](#))
- On 64-bit systems, use of the `cp1250` character set with a primary key column in a `LIKE` clause caused a server crash for patterns having letters in the range 128..255. ([Bug#19741](#))
- `DESCRIBE` returned the type `BIGINT` for a column of a view if the column was specified by an expression over values of the type `INT`. ([Bug#19714](#))
- An issue with `yaSSL` prevented `Connector/J` clients from connecting to the server using a certificate. ([Bug#19705](#))
- A cast problem caused incorrect results for prepared statements that returned float values when MySQL was compiled with `gcc 4.0`. ([Bug#19694](#))
- The `mysql_list_fields()` C API function returned the incorrect table name for views. ([Bug#19671](#))
- If a query had a condition of the form `tableX.key = tableY.key`, which participated in equality propagation and also was used for `ref` access, then early `ref`-access `NULL` filtering was not performed for the condition. This could make query execution slower. ([Bug#19649](#))
- Repeated `DROP TABLE` statements in a stored procedure could sometimes cause the server to crash. ([Bug#19399](#))
- When not running in strict mode, the server failed to convert the invalid years portion of a `DATE` or `DATETIME` value to `'0000'` when inserting it into a table.

This patch was reverted in MySQL 5.0.42. ([Bug#19370](#))

- The final parenthesis of a `CREATE INDEX` statement occurring in a stored procedure was omitted from the binary log when the stored procedure was called. ([Bug#19207](#))
- A `SELECT` with a subquery that was bound to the outer query over multiple columns returned different results when a constant

was used instead of one of the dependant columns. (Bug#18925)

- Setting `myisam_repair_threads` caused any repair operation on a `MyISAM` table to fail to update the cardinality of indexes, instead making them always equal to 1. (Bug#18874)
- `FEDERATED` tables raised invalid duplicate key errors when attempting on one server to insert rows having the same primary key values as rows that had been deleted from the linked table on the other server. (Bug#18764)
- The implementation for `UNCOMPRESS()` did not indicate that it could return `NULL`, causing the optimizer to do the wrong thing. (Bug#18539)
- Using `> ALL` with subqueries that return no rows yielded incorrect results under certain circumstances due to incorrect application of `MIN()`/`MAX()` optimization. (Bug#18503)
- Referring to a stored function qualified with the name of one database and tables in another database caused a “table doesn't exist” error. (Bug#18444)
- For `NDB` and possibly `InnoDB` tables, a `BEFORE UPDATE` trigger could insert incorrect values. (Bug#18437)
- Triggers on tables in the `mysql` database caused a server crash. Triggers for tables in this database now are disallowed. (Bug#18361)
- The length of the pattern string prefix for `LIKE` operations was calculated incorrectly for multi-byte character sets. As a result, the scanned range was wider than necessary if the prefix contained any multi-byte characters, and rows could be missing from the result set. (Bug#18359, Bug#16674)
- Multiple invocations of the `REVERSE()` function could return different results. (Bug#18243)
- The optimizer did not take advantage of indexes on columns used for the second or third arguments of `BETWEEN`. (Bug#18165)
- For table-format output, `mysql` did not always calculate columns widths correctly for columns containing multi-byte characters in the column name or contents. (Bug#17939)
- The character set was not being properly initialized for `CAST()` with a type like `CHAR(2) BINARY`, which resulted in incorrect results or even a server crash. (Bug#17903)
- Checking a `MyISAM` table (using `CHECK TABLE`) having a spatial index and only one row would wrongly indicate that the table was corrupted. (Bug#17877)
- A stored procedure that created and invoked a prepared statement was not executed when called in a `mysqld` init-file. (Bug#17843)
- It is possible to create `MERGE` tables into which data cannot be inserted (by not specifying a `UNION` clause. However, when an insert was attempted, the error message was confusing. Now an error occurs indicating that the table is read-only. (Bug#17766)
- Attempting to insert a string of greater than 4096 bytes into a `FEDERATED` table resulted in the error `ERROR 1296 (HY000) AT LINE 2: GOT ERROR 10000 'ERROR ON REMOTE SYSTEM: 1054: UNKNOWN COLUMN 'STRING-VALUE' FROM FEDERATED`. This error was raised regardless of the type of column involved (`VARCHAR`, `TEXT`, and so on.) (Bug#17608)
- Views could not be updated within a stored function or trigger. (Bug#17591)
- Use of the `--prompt` option or `prompt` command caused `mysql` to be unable to connect to the Instance Manager. (Bug#17485)
- `N'xxx'` and `_utf8'xxx'` were not treated as equivalent because `N'xxx'` failed to unescape backslashes (`\`) and doubled apostrophe/single quote characters (`'`). (Bug#17313)
- Use of the join cache in favor of an index for `ORDER BY` operations could cause incorrect result sorting. (Bug#17212)
- The `PASSWORD()` function returned invalid results when used in some `UNION` queries. (Bug#16881)
- `ORDER BY RAND() LIMIT 1` always set a user variable to the last possible value from the table. (Bug#16861)
- When performing a `GROUP_CONCAT()`, the server transformed `BLOB` columns `VARCHAR` columns, which could cause erroneous results when using Connector/J and possibly other MySQL APIs. (Bug#16712)
- Stored procedures did not use the character set defined for the database in which they were created. (Bug#16676)
- Some server errors were not reported to the client, causing both to try to read from the connection until a hang or crash resulted. (Bug#16581)

- `perror` did not properly report NDB error codes. (Bug#16561)
 - On Windows, a definition for `mysql_set_server_option()` was missing from the C client library. (Bug#16513)
 - Updating a column of a `FEDERATED` table to `NULL` sometimes failed. (Bug#16494)
 - For `SELECT ... FOR UPDATE` statements that used `DISTINCT` or `GROUP BY` over all key parts of a unique index (or primary key), the optimizer unnecessarily created a temporary table, thus losing the linkage to the underlying unique index values. This caused a `Result set not updatable` error. (The temporary table is unnecessary because under these circumstances the distinct or grouped columns must also be unique.) (Bug#16458)
 - Using `ANY` with “non-table” subqueries such as `SELECT 1` yielded incorrect results under certain circumstances due to incorrect application of `MIN()`/`MAX()` optimization. (Bug#16302)
 - A subquery in the `WHERE` clause of the outer query and using `IN` and `GROUP BY` returned an incorrect result. (Bug#16255)
 - A query could produce different results with and without an index, if the `WHERE` clause contained a range condition that used an invalid `DATETIME` constant. (Bug#16249)
 - `TIMESTAMPDIFF()` examined only the date and ignored the time when the requested difference unit was months or quarters. (Bug#16226)
 - Using tables from MySQL 4.x in MySQL 5.x, in particular those with `VARCHAR` fields and using `INSERT DELAYED` to update data in the table would result in either data corruption or a server crash. (Bug#16218, Bug#17294, Bug#16611)
 - The value returned by a stored function returning a string value was not of the declared character set. (Bug#16211)
 - The `index_merge/Intersection` optimizer could have a memory overrun when the number of table columns covered by an index is sufficiently large, possibly resulting in a server crash. (Bug#16201)
 - `DECIMAL` columns were handled incorrectly in two respects :
 1. When the precision of the column was too small for the value. In this case, the original value was returned instead of an error.
 2. When the scale of the column was set to 0. In this case, the value was treated as though the scale had been defined as 2.
- (Bug#16172)
- Certain queries having a `WHERE` clause that included conditions on multi-part keys with more than 2 key parts could produce incorrect results and send `[NOTE] USE_COUNT: WRONG COUNT FOR KEY AT...` messages to `STDERR`. (Bug#16168)
 - When a row was inserted through a view but did not specify a value for a column that had no default value in the base table, no warning or error occurred. Now a warning occurs, or an error in strict SQL mode. (Bug#16110)
 - When `NOW()` was used in a `BETWEEN` clause of the definition for a view, it was replaced with a constant in the view. (Bug#15950)
 - The C API failed to return a status message when invoking a stored procedure. (Bug#15752)
 - `mysqlimport` sends a `set @@character_set_database=binary` statement to the server, but this is not understood by pre-4.1 servers. Now `mysqlimport` encloses the statement within a `/*!40101 ... */` comment so that old servers will ignore it. (Bug#15690)
 - For the `CSV` storage engine, memory-mapped pages of the data file were not invalidated when new data was appended to the file via traditional (file descriptor-based) I/O primitives. (Bug#15669)
 - `SHOW GRANTS FOR CURRENT_USER` did not return definer grants when executed in `DEFINER` context (such as within a stored procedure defined with `SQL SECURITY DEFINER`), it returned the invoker grants. (Bug#15298)
 - The `--collation-server` server option was being ignored. With the fix for this problem, if you choose a non-default character set with `--character-set-server`, you should also use `--collation-server` to specify the collation. (Bug#15276)
 - The server crashed if it tried to access a `CSV` table for which the data file had been removed. (Bug#15205)
 - Tables created with the `FEDERATED` storage engine did not permit indexes using `NULL` columns. (Bug#15133)
 - When using tables created under MySQL 4.1 with a 5.0 server, if the tables contained `VARCHAR` columns, for some queries the metadata sent to the client could have an empty column name. (Bug#14897)

- `CREATE TABLE ... SELECT` statements that selected `GEOMETRY` values resulted in a table that contained `BLOB` columns, not `GEOMETRY` columns. (Bug#14807)
- When setting a column to its implicit default value as the result of inserting a `NULL` into a `NOT NULL` column as part of a multi-row insert or `LOAD DATA` operation, the server returned a misleading warning message. (Bug#14770)
- The use of `WHERE col_name IS NULL` in `SELECT` statements reset the value of `LAST_INSERT_ID()` to zero. (Bug#14553)
- Inserts into `BIT` columns of `FEDERATED` tables did not work. (Bug#14532)
- Using `SELECT` and a table join while running a concurrent `INSERT` operation would join incorrect rows. (Bug#14400)
- Prepared statements caused general log and server memory corruption. (Bug#14346)
- `libmysqld` produced some warnings to `stderr` which could not be silenced. These warnings now are suppressed. (Bug#13717)
- The Instance Manager allowed `STOP INSTANCE` to be used on a server instance that was not running. (Bug#12673)
- For very complex `SELECT` statements could create temporary tables that were too big, but for which the temporary files did not get removed, causing subsequent queries to fail. (Bug#11824)
- `USE` did not refresh database privileges when employed to re-select the current database. (Bug#10979)
- The type of the value returned by the `VARIANCE()` function varied according to the type of the input value. The function should always return a `DOUBLE` value. (Bug#10966)
- The same trigger error message was produced under two conditions: The trigger duplicated an existing trigger name, or the trigger duplicated an existing combination of action and event. Now different messages are produced for the two conditions so as to be more informative. (Bug#10946)
- `CREATE USER` did not respect the 16-character username limit. (Bug#10668)
- A server or network failure with an open client connection would cause the client to hang even though the server was no longer available. (Bug#9678)
- `INSERT INTO ... SELECT ... LIMIT 1` could be slow because the `LIMIT` was ignored when selecting candidate rows. (Bug#9676)
- The optimizer could produce an incorrect result after `AND` with collations such as `latin1_german2_ci`, `utf8_czech_ci`, and `utf8_lithianian_ci`. (Bug#9509)
- A stored procedure with a `CONTINUE` handler that encountered an error continued to execute a statement that caused an error, rather with the next statement following the one that caused the error. (Bug#8153)
- A user variable set to a value selected from an unsigned column was stored as a signed value. (Bug#7498)
- The `--with-collation` option was not honored for client connections. (Bug#7192)
- When the precision of the column was too small for the value. In this case, the original value was returned instead of an error.
- When the scale of the column was set to 0. In this case, the value. In this case, the value was treated as though the scale had been defined as 2.

E.1.4. Changes in MySQL 5.0.24a (25 August 2006)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.24.

Bugs fixed:

- The shared compatibility RPM files were missing some files. (Bug#22251)
- `mysqld` could crash when closing temporary tables. (Bug#21582)
- MySQL 5.0.24 introduced an ABI incompatibility, which this release reverts. Programs compiled against 5.0.24 are not compatible with any other version and must be recompiled. (Bug#21543)
- Pathname separator and device characters were not correctly parameterized for NetWare, causing `mysqld` startup errors.

[Bug#21537](#))

- Closing of temporary tables failed if binary logging was not enabled. ([Bug#20919](#))
- For statements that have a `DEFINER` clause such as `CREATE TRIGGER` or `CREATE VIEW`, long usernames or hostnames could cause a buffer overflow. ([Bug#16899](#))

E.1.5. Changes in MySQL 5.0.24 (27 July 2006)

This is a bugfix release for the current production release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- In the `INFORMATION_SCHEMA.ROUTINES` table the `ROUTINE_DEFINITION` column now is defined as `NULL` rather than `NOT NULL`. Also, `NULL` rather than the empty string is returned as the column value if the user does not have sufficient privileges to see the routine definition. ([Bug#20230](#))
- The `LEFT()` and `RIGHT()` functions return `NULL` if any argument is `NULL`. ([Bug#11728](#))
- Program Database files (extension `pdf`) are now included by default in Windows distributions. These can be used to help diagnose problems with `mysqld` and other tools. See [Section 26.4.1, “Debugging a MySQL Server”](#).

Bugs fixed:

- **Security Fix:** If a user has access to `MyISAM` table `t`, that user can create a `MERGE` table `m` that accesses `t`. However, if the user's privileges on `t` are subsequently revoked, the user can continue to access `t` by doing so through `m`. If this behavior is undesirable, you can start the server with the new `--skip-merge` option to disable the `MERGE` storage engine. ([Bug#15195](#), [CVE-2006-4031](#))
- **MySQL Cluster:** The `ndb_size.pl` script did not account for `TEXT` and `BLOB` column values correctly. ([Bug#21204](#))
- **MySQL Cluster:** The repeated creating and dropping of a table would eventually lead to `NDB Error 826, TOO MANY TABLES AND ATTRIBUTES ... INSUFFICIENT SPACE`. ([Bug#20847](#))
- Under heavy load (executing more than 1024 simultaneous complex queries), a problem in the code that handles internal temporary tables could lead to writing beyond allocated space and memory corruption. Use of more than 1024 simultaneous cursors server wide also could lead to memory corruption. (This applies both to stored procedure and C API cursors.) ([Bug#21206](#))
- Failure to account for a `NULL` table pointer on big-endian machines could cause a server crash during type conversion. ([Bug#21135](#))
- `mysqldump` sometimes did not select the correct database before trying to dump views from it, resulting in an empty result set that caused `mysqldump` to die with a segmentation fault. ([Bug#21014](#))
- A `SELECT` that used a subquery in the `FROM` clause that did not select from a table failed when the subquery was used in a join. ([Bug#21002](#))
- `REPLACE ... SELECT` for a view required the `INSERT` privilege for tables other than the table being modified. ([Bug#20989](#))
- A race condition during slave server shutdown caused an assert failure. ([Bug#20850](#))
- Issuing a `SHOW CREATE FUNCTION` or `SHOW CREATE PROCEDURE` statement without sufficient privileges could crash the `mysql` client. ([Bug#20664](#))
- In a view defined with `SQL SECURITY DEFINER`, the `CURRENT_USER()` function returned the invoker, not the definer. ([Bug#20570](#))
- With the `auto_increment_increment` system variable set larger than 1, if the next generated `AUTO_INCREMENT` value would be larger than the column's maximum value, the value would be clipped down to that maximum value and inserted, even if the resulting value would not be in the generated sequence. This could cause problems for master-master replication. Now the server clips the value down to the previous value in the sequence, which correctly produces a duplicate-key error if that value

already exists in the column. (Bug#20524)

- `SELECT @@INSERT_ID` displayed a value unrelated to a preceding `SET INSERT_ID`. (It was returning `LAST_INSERT_ID` instead.) (Bug#20392)
- The `mysql` client did not understand `help` commands that had spaces at the end. (Bug#20328)
- `mysqldump` produced a malformed dump file when dumping multiple databases that contained views. (Bug#20221)
- If a table on a slave server had a higher `AUTO_INCREMENT` counter than the corresponding master table (even though all rows of the two tables were identical), in some cases `REPLACE` or `INSERT ... ON DUPLICATE KEY UPDATE` would not replicate properly using statement-based logging. (Different values would be inserted on the master and slave.) (Bug#20188)
- For a `DATE` parameter sent via a `MYSQL_TIME` data structure, `mysql_stmt_execute()` zeroed the hour, minute, and second members of the structure rather than treating them as read-only. (Bug#20152)
- Performing `INSERT ... SELECT ... JOIN ... USING` without qualifying the column names caused `ERROR 1052 "column 'x' in field list is ambiguous"` even in cases where the column references were unambiguous. (Bug#18080)
- Using the extended syntax for `TRIM()` — that is, `TRIM(... FROM ...)` — in a `SELECT` statement defining a view caused an invalid syntax error when selecting from the view. (Bug#17526)
- Assignments of values to variables of type `TEXT` were handled incorrectly in stored routines. (Bug#17225)
- `DATE_ADD()` and `DATE_SUB()` returned `NULL` when the result date was on the day '9999-12-31'. (Bug#12356)
- The `DATA DIRECTORY` table option did not work for `TEMPORARY` tables. (Bug#8706)
- Bug#10952 may cause inadvertent data loss. A fix for this bug was included in MySQL 5.0.23, but the approach used caused a loss of intended functionality. Because of this, that fix has been reverted in MySQL 5.0.24. As a consequence, the risk of inadvertent data loss still exists (see Bug#10952).

E.1.6. Changes in MySQL 5.0.23 (Not released)

MySQL 5.0.23 was never officially released.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **MySQL Cluster:** The limit of 2048 ordered indexes per cluster has been lifted. There is now no upper limit on the number of ordered indexes (including `AUTO_INCREMENT` columns) that may be used. (Bug#14509)
- **MySQL Cluster:** The status variables `Ndb_connected_host` and `Ndb_connected_port` were renamed to `Ndb_config_from_host` and `Ndb_config_from_port`, respectively.
- The `mysqldumpslow` script has been moved from client RPM packages to server RPM packages. This corrects a problem where `mysqldumpslow` could not be used with a client-only RPM install, because it depends on `my_print_defaults` which is in the server RPM. (Bug#20216)
- Added the `log_queries_not_using_indexes` system variable. (Bug#19616)
- Added the `ssl_ca`, `ssl_capath`, `ssl_cert`, `ssl_cipher`, and `ssl_key` system variables, which display the values given via the corresponding command options. See Section 5.8.7.3, “SSL Command Options”. (Bug#19606)
- SQL syntax for prepared statements now supports `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE`. (Bug#19308)
- For a table with an `AUTO_INCREMENT` column, `SHOW CREATE TABLE` now shows the next `AUTO_INCREMENT` value to be generated. (Bug#19025)
- The `ONLY_FULL_GROUP_BY` SQL mode now also applies to the `HAVING` clause. That is, columns not named in the `GROUP BY` clause cannot be used in the `HAVING` clause if not used in an aggregate function. (Bug#18739)
- Added the `--set-charset` option to `mysqlbinlog` to allow the character set to be specified for processing binary log

files. (Bug#18351)

- The bundled yaSSL library was upgraded to version 1.3.5. This improves handling of certain problems with SSL-related command options. (Bug#17737)
- Added the `--ssl-verify-server-cert` option to MySQL client programs. This option causes the server's Common Name value in the certificate that the server sends to the client to be verified against the hostname that the client uses for connecting to the server, and the connection is rejected if there is a mismatch. Added `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` option for the `mysql_options()` C API function to enable this verification. This feature can be used to prevent man-in-the-middle attacks. Verification is disabled by default. (Bug#17208)
- It is now possible to use `NEW.var_name` values within triggers as `INOUT` parameters to stored procedures. (Bug#14635)
- Added the `--angel-pid-file` option to `mysqlmanager` for specifying the file in which the angel process records its process ID when `mysqlmanager` runs in daemon mode. (Bug#14106)
- The `mysql_get_ssl_cipher()` C API function was added.
- The `mysql_upgrade` command has been converted from a shell script to a C program, so it is available on non-Unix systems such as Windows. This program should be run for each MySQL upgrade. See Section 5.5.8, “`mysql_upgrade` — Check Tables for MySQL Upgrade”.
- Binary distributions that include SSL support now are built using yaSSL when possible.

Bugs fixed:

- **MySQL Cluster:** The `mgm` client command `ALL CLUSTERLOG STATISTICS=15;` had no effect. (Bug#20336)
- **MySQL Cluster:** The failure of a data node when preparing to commit a transaction (that is, while the node's status was `CS_PREPARE_TO_COMMIT`) could cause the failure of other cluster data nodes. (Bug#20185)
- **MySQL Cluster:** An internal formatting error caused some management client error messages to be unreadable. (Bug#20016)
- **MySQL Cluster:** Renaming a table in such a way as to move it to a different database failed to move the table's indexes. (Bug#19967)
- **MySQL Cluster:** Running management client commands while `mgmd` was in the process of disconnecting could cause the management server to fail. (Bug#19932)
- **MySQL Cluster:** Running `ALL START` in the `NDB` management client or restarting multiple nodes simultaneously could under some circumstances cause the cluster to crash. (Bug#19930)
- **MySQL Cluster:** `TEXT` columns in Cluster tables having both an explicit primary key and a unique key were not correctly updated by `REPLACE` statements. (Bug#19906)
- **MySQL Cluster:** The cluster's data nodes would fail while trying to load data when `NoOfFrangmentLogFiles` was equal to 1. (Bug#19894)
- **MySQL Cluster:** Restoring a backup made using `ndb_restore` failed when the backup had been taken from a cluster whose data memory was full. (Bug#19852)
- **MySQL Cluster:** Resources for unique indexes on Cluster table columns were incorrectly allocated, so that only one-fourth as many unique indexes as indicated by the value of `UniqueHashIndexes` could be created. (Bug#19623)
- **MySQL Cluster:** (NDBAPI): On big-endian platforms, `NdbOperation::write_attr()` did not update 32-bit fields correctly. (Bug#19537)
- **MySQL Cluster:** `LOAD DATA LOCAL` failed to ignore duplicate keys in Cluster tables. (Bug#19496)
- **MySQL Cluster:** A problem with error handling when `ndb_use_exact_count` was enabled could lead to incorrect values returned from queries using `COUNT()`. A warning is now returned in such cases. (Bug#19202)
- **MySQL Cluster:** `TRUNCATE` failed on tables having `BLOB` or `TEXT` columns with the error `LOCK WAIT TIMEOUT EXCEEDED`. (Bug#19201)
- **MySQL Cluster:** Stopping multiple nodes could cause node failure handling not to be completed. (Bug#19039)
- **MySQL Cluster:** The management client `ALL STOP` command shut down `mgmd` processes (as well as `ndbd` processes). (Bug#18966)

- **MySQL Cluster:** `TRUNCATE TABLE` failed to reset the `AUTO_INCREMENT` counter. (Bug#18864)
- **MySQL Cluster:** Repeated `CREATE - INSERT - DROP` operations tables could in some circumstances cause the MySQL table definition cache to become corrupt, so that some `mysqld` processes could access table information but others could not. (Bug#18595)
- **MySQL Cluster:** Repeated use of the `SHOW` and `ALL STATUS` commands in the `ndb_mgm` client could cause the `mgmd` process to crash. (Bug#18591)
- **MySQL Cluster:** `ndbd` could sometimes fail to start with the error `NODE FAILURE HANDLING NOT COMPLETED` following a graceful restart. (Bug#18550)
- **MySQL Cluster:** Backups could fail for large clusters with many tables, where the number of tables approached `MaxNoOfTables`. (Bug#17607)
- **MySQL Cluster:** An issue with `ndb_mgmd` prevented more than 27 `mysqld` processes from connecting to a single cluster at one time. (Bug#17150)
- **MySQL Cluster:** Using “stale” `mysqld .FRM` files could cause a newly-restored cluster to fail. This situation could arise when restarting a MySQL Cluster using the `--initial` option while leaving connected `mysqld` processes running. (Bug#16875)
- **MySQL Cluster:** Data node failures could cause excessive CPU usage by `ndb_mgmd`. (Bug#13987)
- **MySQL Cluster:** Cluster system status variables were not updated. (Bug#11459)
- **MySQL Cluster:** Some queries having a `WHERE` clause of the form `c1=val1 OR c2 LIKE 'val2'` were not evaluated correctly. (Bug # 17421)
- **MySQL Cluster:** (NDBAPI): Update operations on blobs were not checked for illegal operations.

Note

Read locks with blob update operations are now upgraded from read committed to read shared.

- For `mysqld`, Valgrind revealed problems that were corrected: A dangling stack pointer being overwritten ; possible uninitialized data in a string comparison; memory corruption in replication slaves when switching databases; syscall write parameter pointing to uninitialized byte. (Bug#20769, Bug#20783, Bug#19022, Bug#20579)
- A buffer overwrite error in Instance Manager caused a crash. (Bug#20622)
- On Windows, temporary tables containing “ : ” in the name could not be created. (Bug#20616)
- The `fill_help_tables.sql` file did not contain a `SET NAMES 'utf8'` statement to indicate its encoding. This caused problems for some settings of the MySQL character set such as `big5`. (Bug#20551)
- The `fill_help_tables.sql` file did not load properly if the `ANSI_QUOTES` SQL mode was enabled. (Bug#20542)
- `mysql_upgrade` was missing from binary MySQL distributions. (Bug#20403, Bug#18516, Bug#20556)
- Several aspects of view privileges were being checked incorrectly. (Bug#20363, Bug#18681)
- Queries using an indexed column as the argument for the `MIN()` and `MAX()` functions following an `ALTER TABLE ... DISABLE KEYS` statement returned `GOT ERROR 124 FROM STORAGE ENGINE` until `ALTER TABLE ... ENABLE KEYS` was run on the table. (Bug#20357)
- The thread for `INSERT DELAYED` rows was maintaining a separate `AUTO_INCREMENT` counter, resulting in incorrect values being assigned if `DELAYED` and non-`DELAYED` inserts were mixed. (Bug#20195)
- On Linux, `libmysqlclient` when compiled with yaSSL using the `icc` compiler had a spurious dependency on C++ libraries. (Bug#20119)
- A number of dependency issues in the RPM `bench` and `test` packages caused installation of these packages to fail. (Bug#20078)
- A compatibility issue with NPTL (Native POSIX Thread Library) on Linux could result in a deadlock with `FLUSH TABLES WITH READ LOCK` under some conditions. (Bug#20048)
- Some outer joins were incorrectly converted to inner joins. (Bug#19816)

This regression was introduced by Bug#17146

- If there is a global read lock, `CREATE DATABASE` and `DROP DATABASE` could deadlock. (Bug#19815)
- The `WITH CHECK OPTION` was not enforced when a `REPLACE` statement was executed against a view. (Bug#19789)
- Multiple-table updates with `FEDERATED` tables could cause a server crash. (Bug#19773)
- `InnoDB` unlocked its data directory before committing a transaction, potentially resulting in non-recoverable tables if a server crash occurred before the commit. (Bug#19727)
- Subqueries that produced a `BIGINT UNSIGNED` value were being treated as returning a signed value. (Bug#19700)
- `GROUP BY` on an expression that contained a cast to `DECIMAL` produced an incorrect result. (Bug#19667)
- `MERGE` tables did not work reliably with `BIT` columns. (Bug#19648)
- Re-execution of a prepared multiple-table `DELETE` statement that involves a trigger or stored function can result in a server crash. (Bug#19634)
- The range operator failed and caused a server crash for clauses of the form `tbl_name.unsigned_keypart NOT IN (negative_const, ...)`. (Bug#19618)
- `CHECK TABLE` on a `MyISAM` table briefly cleared its `AUTO_INCREMENT` value, while holding only a read lock. Concurrent inserts to that table could use the wrong `AUTO_INCREMENT` value. `CHECK TABLE` no longer modifies the `AUTO_INCREMENT` value. (Bug#19604)
- Using `CONCAT(@user_var, col_name)`, where `col_name` is a column in an `INFORMATION_SCHEMA` table, could cause erroneous duplication of data in the query result. (Bug#19599)
- Some `yaSSL` public function names conflicted with those from `OpenSSL`, causing conflicts for applications that linked against both `OpenSSL` and a version of `libmysqlclient` that was built with `yaSSL` support. The `yaSSL` public functions now are renamed to avoid this conflict. (Bug#19575)
- A view definition that referred to an alias in the `HAVING` clause could be saved in the `.frm` file with the alias replaced by the expression that it referred to, causing failure of subsequent `SELECT * FROM view_name` statements. (Bug#19573)
- `mysql` displayed `NULL` for strings that are empty or contain only spaces. (Bug#19564)
- `InnoDB` did not increment the `handler_read_prev` counter. (Bug#19542)
- Selecting from a view that used `GROUP BY` on a non-constant temporal interval (such as `DATE(col) + INTERVAL TIME_TO_SEC(col) SECOND`) could cause a server crash. (Bug#19490)
- `mysqldump` did not dump the table name correctly for some table identifiers that contained unusual characters such as “ : ”. (Bug#19479)
- On 64-bit Windows systems, `REGEXP` for regular expressions with exactly 31 characters did not work. (Bug#19407)
- An outer join of two views that was written using `{ OJ ... }` syntax could cause a server crash. (Bug#19396)
- Race conditions on certain platforms could cause the Instance Manager to fail to initialize. (Bug#19391)
- Use of the `--no-pager` option caused `mysql` to crash. (Bug#19363)
- For `ndb_mgmd`, Valgrind revealed problems that were corrected: A memory leak; a dependency on an uninitialized variable. (Bug#19318, Bug#20333)
- In the `INFORMATION_SCHEMA.COLUMNS` table, the values for the `CHARACTER_MAXIMUM_LENGTH` and `CHARACTER_OCTET_LENGTH` columns were incorrect for multi-byte character sets. (Bug#19236)
- Multiple-table `DELETE` statements containing a subquery that selected from one of the tables being modified caused a server crash. (Bug#19225)
- On Windows, removal of binary log files would fail if the files were already open. (Bug#19208)
- Flushing the compression buffer (via `FLUSH TABLE`) no longer increases the size of an unmodified `ARCHIVE` table. (Bug#19204)
- An `ALTER TABLE` operation that does not need to copy data, when executed on a table created prior to MySQL 4.0.25, could result in a server crash for subsequent accesses to the table. (Bug#19192)
- SSL connections using `yaSSL` on `OpenBSD` could fail. (Bug#19191)

- Attempting to set the default value of an `ENUM` or `SET` column to `NULL` caused a server crash. (Bug#19145)
- Use of uninitialized user variables in a subquery in the `FROM` clause results in bad entries in the binary log. (Bug#19136)
- A `CREATE TABLE` statement that created a table from a materialized view did not inherit default values from the underlying table. (Bug#19089)
- `mysql-test-run.pl` started `NDB` even for test cases that didn't need it. (Bug#19083)
- Index prefixes for `utf8 VARCHAR` columns did not work for `UPDATE` statements. (Bug#19080)
- Premature optimization of nested subqueries in the `FROM` clause that refer to aggregate functions could lead to incorrect results. (Bug#19077)
- The parser leaked memory when its stack needed to be extended. (Bug#18930)
- `BIT` columns in a table could cause joins that use the table to fail. (Bug#18895)
- The MySQL server startup script `/etc/init.d/mysql` (created from `mysql.server`) is now marked to ensure that the system services `yppbind`, `nscd`, `ldap`, and `NTP` are started first (if these are configured on the machine). (Bug#18810)
- The `COM_STATISTICS` command was changed in 5.0.3 to display session status variable values rather than global values. This causes `mysqladmin status` information not to be useful for the `Slow queries` and `Opens` values. Now `COM_STATISTICS` displays the global values for `Slow queries` and `Opens`. (Bug#18669)
- `LOAD DATA FROM MASTER` would fail when trying to load the `INFORMATION_SCHEMA` database from the master, because the `INFORMATION_SCHEMA` system database would already exist on the slave. (Bug#18607)
- `BLOB` or `TEXT` arguments to or values returned from stored functions were not copied properly if too long and could become garbled. (Bug#18587)
- The `IN-to-EXISTS` transformation was making a reference to a parse tree fragment that was left out of the parse tree. This caused problems with prepared statements. (Bug#18492)
- `mysqldump` produced garbled output for view definitions. (Bug#18462)
- The configuration information for building the embedded server on Windows was missing a file. (Bug#18455)
- In `mysqltest`, `--sleep=0` had no effect. Now it correctly causes `sleep` commands in test case files to sleep for 0 seconds. (Bug#18312)
- `INFORMATION_SCHEMA.TABLES` provided inconsistent info about invalid views. This could cause server crashes or result in incorrect data being returned for queries that attempt to obtain information from `INFORMATION_SCHEMA` tables about views using stored functions. (Bug#18282)
- On Windows, corrected a crash stemming from differences in Visual C runtime library routines from POSIX behavior regarding invalid file descriptors. (Bug#18275)
- On Windows, terminating `mysqld` with Control-C could result in a crash during shutdown. (Bug#18235)
- Selecting data from a `MEMORY` table with a `VARCHAR` column and a `HASH` index over it returned only the first row matched. (Bug#18233)
- The use of `MIN()` and `MAX()` on columns with an index prefix produced incorrect results in some queries. (Bug#18206)
- An entry in the `mysql.proc` table with an empty routine name caused access to the `INFORMATION_SCHEMA.ROUTINES` table to crash the server. (Bug#18177)
- A `UNION` over more than 128 `SELECT` statements that use an aggregate function failed. (Bug#18175)
- Updates to a `MEMORY` table caused the size of `BTREE` indexes for the table to increase. (Bug#18160)
- `SELECT DISTINCT` queries sometimes returned only the last row. (Bug#18068)
- Returning the value of a system variable from a stored function caused a server crash. (Bug#18037)
- An update that used a join of a table to itself and modified the table on both sides of the join reported the table as crashed. (Bug#18036)
- Race conditions on certain platforms could cause the Instance Manager to try to restart the same instance multiple times. (Bug#18023)

- For a reference to a non-existent index in `FORCE INDEX`, the error message referred to a column, not an index. (Bug#17873)
- The `sql_big_selects` system variable was not displayed by `SHOW VARIABLES`. (Bug#17849)
- `REPAIR TABLE` did not restore the length for packed keys in tables created under MySQL 4.x, which caused them to appear corrupt to `CHECK TABLE` but not to `REPAIR TABLE`. (Bug#17810)
- A `NUL` byte within a comment in a statement string caused the rest of the string not to be written to the query log, allowing logging to be bypassed. (Bug#17667, CVE-2006-0903)
- Results from `INFORMATION_SCHEMA.SCHEMATA` could contain uppercase information when `lower_case_table_names` was not 0. (Bug#17661)
- `CREATE TABLE ... SELECT` did not always produce the proper column default value in `TRADITIONAL SQL` mode. (Bug#17626)
- A range access optimizer heuristic was invalid, causing some queries to be much slower in MySQL 5.0 than in 4.0. (Bug#17379, Bug#18940)
- `mysqldump` would not dump views that had become invalid because a table named in the view definition had been dropped. Instead, it quit with an error message. Now you can specify the `--force` option to cause `mysqldump` to keep going and write a SQL comment containing the view definition to the dump output. (Bug#17371)
- The `--core-file-size` option for `mysqld_safe` was effective only for `root`. (Bug#17353)
- On Windows, multiple clients simultaneously attempting to perform `ALTER TABLE` operations on an `InnoDB` table could deadlock. (Bug#17264)
- The binary log would create an incorrect `DROP` query when creating temporary tables during replication. (Bug#17263)
- Revised memory allocation for local objects within stored functions and triggers to avoid memory leak for repeated function or trigger invocation. (Bug#17260)
- Multiple calls to a stored procedure that selects from `INFORMATION_SCHEMA` could cause a server crash. (Bug#17204)
- Views created from prepared statements inside of stored procedures were created with a definition that included both `SQL_CACHE` and `SQL_NO_CACHE`. (Bug#17203)
- `mysqldump` wrote an extra pair of `DROP DATABASE` and `CREATE DATABASE` statements if run with the `--add-drop-database` option and the database contained views. (Bug#17201)
- A `TABLE ... DOESN'T EXIST` error could occur for statements that called a function defined in another database. (Bug#17199)
- For certain `CREATE TABLE ... SELECT` statements, the selected values were truncated when inserted into the new table. (Bug#17048)
- `ALTER TABLE` on a table created prior to 5.0.3 would cause table corruption if the `ALTER TABLE` did one of the following:
 - Change the default value of a column.
 - Change the table comment.
 - Change the table password.(Bug#17001)
- `MyISAM` table deadlock was possible if one thread issued a `LOCK TABLES` request for write locks and then an administrative statement such as `OPTIMIZE TABLE`, if between the two statements another client meanwhile issued a multiple-table `SELECT` for some of the locked tables. (Bug#16986)
- Symlinking `.mysql_history` to `/dev/null` to suppress statement history saving by `mysql` did not work. (`mysql` deleted the symlink and recreated `.mysql_history` as a regular file, and then wrote history to it.) (Bug#16803)
- Concatenating the results of multiple constant subselects produced incorrect results. (Bug#16716)
- Privilege checking on the contents of the `INFORMATION_SCHEMA.VIEWS` table was insufficiently restrictive. (Bug#16681)
- `mysqlcheck` tried to check views instead of ignoring them. (Bug#16502)
- `IS_USED_LOCK()` could return an incorrect connection identifier. (Bug#16501)

- The omission of leading zeros in dates could lead to erroneous results when these were compared with the output of certain date and time functions. (Bug#16377)
- Concurrent reading and writing of privilege structures could crash the server. (Bug#16372)
- Grant table modifications sometimes did not refresh the in-memory tables if the hostname was ' ' or not specified. (Bug#16297)
- The `sql_notes` and `sql_warnings` system variables were not always displayed correctly by `SHOW VARIABLES` (for example, they were displayed as `ON` after being set to `OFF`). (Bug#16195)
- The `max_length` metadata value for columns created from `CONCAT()` could be incorrect when the collation of an argument differed from the collation of the `CONCAT()` itself. In some contexts such as `UNION`, this could lead to truncation of the column contents. (Bug#15962)
- The server no longer uses a signal handler for signal 0 because it could cause a crash on some platforms. (Bug#15869)
- InnoDB does not support `SPATIAL` indexes, but did not prevent creation of such an index. (Bug#15860)
- Long multiple-row `INSERT` statements could take a very long time for some multi-byte character sets. (Bug#15811)
- The `system_time_zone` and `version_*` system variables could not be accessed via `SELECT @@var_name` syntax. (Bug#15684, Bug#12792)
- `EXPLAIN ... SELECT INTO` caused the client to hang. (Bug#15463)
- Nested natural joins worked executed correctly when executed as a non-prepared statement could fail with an `Unknown column 'col_name' in 'field list'` error when executed as a prepared statement, due to a name resolution problem. (Bug#15355)
- The `MD5()` and `SHA()` functions treat their arguments as case-sensitive strings. But when they are compared, their arguments were compared as case-insensitive strings, which leads to two function calls with different arguments (and thus different results) compared as being identical. This can lead to a wrong decision made in the range optimizer and thus to an incorrect result set. (Bug#15351)
- Invalid escape sequences in option files caused MySQL programs that read them to abort. (Bug#15328)
- Re-executing a stored procedure with a complex stored procedure cursor query could lead to a server crash. (Bug#15217)
- `CREATE TABLE ... SELECT ...` statements that used a stored function explicitly or implicitly (through a view) resulted in a `Table not locked` error. (Bug#15137, Bug#12472)
- An invalid comparison between keys with index prefixes over multi-byte character fields could lead to incorrect result sets if the selected query execution plan used a range scan by an index prefix over a `UTF8` character field. This also caused incorrect results under similar circumstances with many other character sets. (Bug#14896)
- A view with a non-existent account in the `DEFINER` clause caused `SHOW CREATE VIEW` to fail. Now `SHOW CREATE VIEW` issues a warning instead. (Bug#14875)
- For `BOOLEAN` mode full-text searches on non-indexed columns, `NULL` rows generated by a `LEFT JOIN` caused incorrect query results. (Bug#14708)
- `SHOW CREATE TABLE` did not display the `AUTO_INCREMENT` column attribute if the SQL mode was `MYSQL323` or `MYSQL40`. This also affected `mysqldump`, which uses `SHOW CREATE TABLE` to get table definitions. (Bug#14515)
- Some queries were slower in 5.0 than in 4.1 because some 4.1 cost-evaluation code had not been merged into 5.0. (Bug#14292)
- The binary log lacked character set information for table name when dropping temporary tables. (Bug#14157)
- The result from `CONV()` is a string, but was not always treated the same way as a string when converted to a real value for an arithmetic operation. (Bug#13975)
- RPM packages had spurious dependencies on Perl modules and other programs. (Bug#13634)
- `REPLACE` statements caused activation of `UPDATE` triggers, not `DELETE` and `INSERT` triggers. (Bug#13479)
- With settings of `read_buffer_size >= 2G` and `read_rnd_buffer_size >= 2G`, `LOAD DATA INFILE` failed with no error message or caused a server crash for files larger than 2GB. (Bug#12982)
- A `B-TREE` index on a `MEMORY` table erroneously reported duplicate entry error for multiple `NULL` values. (Bug#12873)

- Use of `CONVERT_TZ()` in a stored function or trigger (or in a stored procedure called from a stored function or trigger) caused an error. (Bug#11081)
- `LOAD_FILE()` returned an error if the file did not exist, rather than `NULL` as it should according to the manual. (Bug#10418)
- When `myisamchk` needed to rebuild a table, `AUTO_INCREMENT` information was lost. (Bug#10405)
- For certain `CREATE VIEW` statements, the server did not detect invalid subqueries within the `SELECT` part. (Bug#7549)
- Within a trigger, `SET` used the SQL mode of the invoking statement, not the mode in effect at trigger creation time. (Bug#6951)
- An invalid `GRANT` statement for which `Ok` was returned on a replication master caused an error on the slave and replication to fail. (Bug#6774)
- Some queries that used `ORDER BY` and `LIMIT` performed quickly in MySQL 3.23, but slowly in MySQL 4.x/5.x due to an optimizer problem. (Bug#4981)
- The `basedir` and `tmpdir` system variables could not be accessed via `@@var_name` syntax. (Bug#1039)
- Change the table password.
- Change the table comment.
- Change the default value of a column.

E.1.7. Changes in MySQL 5.0.22 (24 May 2006)

This is a security fix release for the previous production release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Bugs fixed:

- **Security Fix:** An SQL-injection security hole has been found in multi-byte encoding processing. The bug was in the server, incorrectly parsing the string escaped with the `mysql_real_escape_string()` C API function.

This vulnerability was discovered and reported by Josh Berkus <josh@postgresql.org> and Tom Lane <tgl@sss.pgh.pa.us> as part of the inter-project security collaboration of the OSDB consortium. For more information about SQL injection, please see the following text.

Discussion: An SQL-injection security hole has been found in multi-byte encoding processing. An SQL-injection security hole can include a situation whereby when a user supplied data to be inserted into a database, the user might inject SQL statements into the data that the server will execute. With regards to this vulnerability, when character set unaware-escaping is used (for example, `addslashes()` in PHP), it is possible to bypass the escaping in some multi-byte character sets (for example, SJIS, BIG5 and GBK). As a result, a function such as `addslashes()` is not able to prevent SQL-injection attacks. It is impossible to fix this on the server side. The best solution is for applications to use character set-aware escaping offered by a function such as `mysql_real_escape_string()`.

However, a bug was detected in how the MySQL server parses the output of `mysql_real_escape_string()`. As a result, even when the character set-aware function `mysql_real_escape_string()` was used, SQL injection was possible. This bug has been fixed.

Workarounds: If you are unable to upgrade MySQL to a version that includes the fix for the bug in `mysql_real_escape_string()` parsing, but run MySQL 5.0.1 or higher, you can use the `NO_BACKSLASH_ESCAPES` SQL mode as a workaround. (This mode was introduced in MySQL 5.0.1.) `NO_BACKSLASH_ESCAPES` enables an SQL standard compatibility mode, where backslash is not considered a special character. The result will be that queries will fail.

To set this mode for the current connection, enter the following SQL statement:

```
SET sql_mode='NO_BACKSLASH_ESCAPES';
```

You can also set the mode globally for all clients:

```
SET GLOBAL sql_mode='NO_BACKSLASH_ESCAPES';
```

This SQL mode also can be enabled automatically when the server starts by using the command-line option `--sql-mode=NO_BACKSLASH_ESCAPES` or by setting `sql-mode=NO_BACKSLASH_ESCAPES` in the server option file (for example, `my.cnf` or `my.ini`, depending on your system). (Bug#8378, CVE-2006-2753)

- The dropping of a temporary table whose name contained a backtick (``) character was not correctly written to the binary log, which also caused it not to be replicated correctly. (Bug#19188)
- The client libraries had not been compiled for position-independent code on Solaris-SPARC and AMD x86_64 platforms. (Bug#18091, Bug#13159, Bug#14202)
- Running `myisampack` followed by `myisamchk` with the `--unpack` option would corrupt the `auto_increment` key. (Bug#12633)
- The patch for Bug#8303 broke the fix for Bug#8378 and was undone. (In string literals with an escape character (\\) followed by a multi-byte character that has a second byte of (\\), the literal was not interpreted correctly. The next byte now is escaped, not the entire multi-byte character. This means it a strict reverse of the `mysql_real_escape_string()` function.)

E.1.8. Changes in MySQL 5.0.21 (02 May 2006)

This MySQL 5.0.21 release includes the patches for recently reported security vulnerabilities in the MySQL client-server protocol. We would like to thank Stefano Di Paola <stefano.dipaola@wisec.it> for finding and reporting these to us.

This is a bugfix release for the current production release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Security Enhancement:** Added the global `max_prepared_stmt_count` system variable to limit the total number of prepared statements in the server. This limits the potential for denial-of-service attacks based on running the server out of memory by preparing huge numbers of statements. The current number of prepared statements is available through the `prepared_stmt_count` system variable. (Bug#16365)
- **MySQL Cluster:** It is now possible to perform a partial start of a cluster. That is, it is now possible to bring up the cluster without running `ndbd --initial` on all configured data nodes first. (Bug#18606)
- **MySQL Cluster:** A new `--nowait-nodes` startup option for `ndbd` makes it possible to “skip” specific nodes without waiting for them to start when starting the cluster. See Section 16.5.5.2, “Command Options for `ndbd`”.
- **MySQL Cluster:** It is now possible to install MySQL with Cluster support to a non-default location and change the search path for font description files using either the `--basedir` or `--character-sets-dir` options. (Previously in MySQL 5.0, `ndbd` searched only the default path for character sets.)
- The `MySQL-shared-compat-5.0.X-i386.rpm` shared compatibility RPMs no longer contain libraries for MySQL 5.1. This avoids a conflict because the 5.0 and 5.1 libraries share the same soname number. It contains libraries for 3.23, 4.0, 4.1, and 5.0. (Bug#19288)
- Creating a table in an `InnoDB` database with a column name that matched the name of an internal `InnoDB` column (including `DB_ROW_ID`, `DB_TRX_ID`, `DB_ROLL_PTR` and `DB_MIX_ID`) would cause a crash. MySQL now returns error 1005 (cannot create table) with `errno` set to -1. (Bug#18934)
- The default for the `innodb_thread_concurrency` system variable was changed to 8. (Bug#15868)
- In result set metadata, the `MYSQL_FIELD.length` value for `BIT` columns now is reported in number of bits. For example, the value for a `BIT(9)` column is 9. (Formerly, the value was related to number of bytes.) (Bug#13601)

Bugs fixed:

- **Security Fix:** Invalid arguments to `DATE_FORMAT()` caused a server crash. Thanks to Jean-David Maillefer for discovering and reporting this problem to the Debian project and to Christian Hammers from the Debian Team for notifying us of it. (Bug#20729, CVE-2006-3469)
- **Security Fix:** A malicious client, using specially crafted invalid `COM_TABLE_DUMP` packets was able to trigger an exploitable

buffer overflow on the server. Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and reporting this bug. (CVE-2006-1518)

- **Security Fix:** A malicious client, using specially crafted invalid login or `COM_TABLE_DUMP` packets was able to read uninitialized memory, which potentially, though unlikely in MySQL, could have led to an information disclosure. (,) Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and reporting this bug. (CVE-2006-1516, CVE-2006-1517)
- **MySQL Cluster:** A simultaneous `DROP TABLE` and table update operation utilising a table scan could trigger a node failure. (Bug#18597)
- **MySQL Cluster:** When multiple node restarts were attempted without allowing each restart to complete, the error message returned was `ARRAY INDEX OUT OF BOUNDS` rather than `TOO MANY CRASHED REPLICAS`. (Bug#18349)
- **MySQL Cluster:** In a 2-node cluster with a node failure, restarting the node with a low value for `StartPartialTimeout` could cause the cluster to come up partitioned (“split-brain” issue).

A similar issue could occur when the cluster was first started with a sufficiently low value for this parameter. (Bug#16447, Bug#18612)

- **MySQL Cluster:** On systems with multiple network interfaces, data nodes would get “stuck” in startup phase 2 if the interface connecting them to the management server was working on node startup while the interface interconnecting the data nodes experienced a temporary outage. (Bug#15695)
- **MySQL Cluster:** On slow networks or CPUs, the management client `SHOW` command could sometimes erroneously show all data nodes as being master nodes belonging to nodegroup 0. (Bug#15530)
- **MySQL Cluster:** Unused open handlers for tables in which the metadata had changed were not properly closed. This could result in stale results from Cluster tables following an `ALTER TABLE`. (Bug#13228)
- **MySQL Cluster:** Uninitialized internal variables could lead to unexpected results. (Bug#11033, Bug#11034)
- **MySQL Cluster:** When attempting to create an index on a `BIT` or `BLOB` column, `ERROR 743: UNSUPPORTED CHARACTER SET IN TABLE OR INDEX` was returned instead of `ERROR 906: UNSUPPORTED ATTRIBUTE TYPE IN INDEX`.
- **InnoDB** could read a delete mark from its system tables incorrectly. (Bug#19217)
- Corrected a syntax error in `mysql-test-run.sh`. (Bug#19190)
- Index corruption could occur in cases when `key_cache_block_size` was not a multiple of `myisam_block_size` (for example, with `key_cache_block_size=1536` and `myisam_block_size=1024`). (Bug#19079)
- The optimizer could cause a server crash or use a non-optimal subset of indexes when evaluating whether to use `Index Merge/Intersection` variant of `index_merge` optimization. (Bug#19021)
- A missing `DEBUG_RETURN()` caused the server to emit a spurious error message: `missing DEBUG_RETURN or DEBUG_VOID_RETURN macro in function "open_table"`. (Bug#18964)
- MySQL would not compile on Linux distributions that use the tinfo library. (Bug#18912)
- `mysql_reconnect()` sent a `SET NAMES` statement to the server, even for pre-4.1 servers that do not understand the statement. (Bug#18830)
- For a reference to a non-existent stored function in a stored routine that had a `CONTINUE` handler, the server continued as though a useful result had been returned, possibly resulting in a server crash. (Bug#18787)
- For single-`SELECT` union constructs of the form `(SELECT ... ORDER BY order_list1 [LIMIT n]) ORDER BY order_list2`, the `ORDER BY` lists were concatenated and the `LIMIT` clause was ignored. (Bug#18767)
- `CREATE VIEW` statements would not be replicated to the slave if the `--replicate-wild-ignore-table` rule was enabled. (Bug#18715)
- Conversion of a number to a `CHAR UNICODE` string returned an invalid result. (Bug#18691)
- `UNCOMPRESS(NULL)` could cause subsequent `UNCOMPRESS()` calls to return `NULL` for legal non-`NULL` arguments. (Bug#18643)
- If the second or third argument to `BETWEEN` was a constant expression such as `'2005-09-01 - INTERVAL 6 MONTH` and the other two arguments were columns, `BETWEEN` was evaluated incorrectly. (Bug#18618)
- A `LOCK TABLES` statement that failed could cause `MyISAM` not to update table statistics properly, causing a subsequent `CHECK TABLE` to report table corruption. (Bug#18544)

- The yaSSL library returned a cipher list in a manner incompatible with OpenSSL. (Bug#18399)
- InnoDB did not use a consistent read for `CREATE ... SELECT` when `innodb_locks_unsafe_for_binlog` was set. (Bug#18350)
- `DROP DATABASE` did not drop stored routines associated with the database if the database name was longer than 21 characters. (Bug#18344)
- The euro sign (€) was not stored correctly in columns using the `latin1_german1_ci` or `latin1_general_ci` collation. (Bug#18321)
- A recent change caused the `mysql` client not to display `NULL` values correctly and to display numeric columns left-justified rather than right-justified. The problems have been corrected. (Bug#18265)
- `COUNT(*)` on a `MyISAM` table could return different results for the base table and a view on the base table. (Bug#18237)
- `EXTRACT(QUARTER FROM date)` returned unexpected results. (Bug#18100)
- Executing `SELECT` on a large table that had been compressed within `myisampack` could cause a crash. (Bug#17917)
- Updating a field value when also requesting a lock with `GET_LOCK()` would cause slave servers in a replication environment to terminate. (Bug#17284)
- Casting a string to `DECIMAL` worked, but casting a trimmed string (using `LTRIM()` or `RTRIM()`) resulted in loss of decimal digits. (Bug#17043)
- `mysql-test-run` could not be run as `root`. (Bug#17002)
- Queries of the form `SELECT DISTINCT timestamp_column WHERE date_function(timestamp_col) = constant` did not return all matching rows. (Bug#16710)
- IA-64 RPM packages for Red Hat and SuSE Linux that were built with the `icc` compiler incorrectly depended on `icc` runtime libraries. (Bug#16662)
- `MySQL-shared-compat-5.0.13-0.i386.rpm`, `MySQL-shared-compat-5.0.15-0.i386.rpm`, `MySQL-shared-compat-5.0.18-0.i386.rpm`, `MySQL-shared-compat-5.0.19-0.i386.rpm`, `MySQL-shared-compat-5.0.20-0.i386.rpm`, and `MySQL-shared-compat-5.0.20a-0.i386.rpm` incorrectly depended on `glibc 2.3` and could not be installed on a `glibc 2.2` system. (Bug#16539)
- The presence of multiple equalities in a condition after reading a constant table could cause the optimizer not to use an index. This resulted in certain queries being much slower than in MySQL 4.1. (Bug#16504)
- Within a trigger, `CONNECTION_ID()` did not return the connection ID of the thread that caused the trigger to be activated. (Bug#16461)
- For tables created in a MySQL 4.1 installation upgraded to MySQL 5.0 and up, multiple-table updates could update only the first matching row. (Bug#16281)
- A query using `WHERE (column_1, column_2) IN ((value_1, value_2)[, (...), ...])` would return incorrect results. (Bug#16248)
- For `mysql.server`, if the `basedir` option was specified after `datadir` in an option file, the setting for `datadir` was ignored and assumed to be located under `basedir`. (Bug#16240)
- If the first argument to `BETWEEN` was a `DATE` or `TIME` column of a view and the other arguments were constants, `BETWEEN` did not perform conversion of the constants to the appropriate temporary type, resulting in incorrect evaluation. (Bug#16069)
- After calling `FLUSH STATUS`, the `max_used_connections` variable did not increment for existing connections and connections which use the thread cache. (Bug#15933)
- Lettercase in database name qualifiers was not consistently handled properly in queries when `lower_case_table_names` was set to 1. (Bug#15917)
- `DELETE` and `UPDATE` statements that used large `NOT IN (value_list)` clauses could use large amounts of memory. (Bug#15872)
- InnoDB failure to release an adaptive hash index latch could cause a server crash if the query cache was enabled. (Bug#15758)
- `LAST_INSERT_ID()` in a stored function or trigger returned zero. (Bug#15728)
- `DELETE` with `LEFT JOIN` for InnoDB tables could crash the server if `innodb_locks_unsafe_for_binlog` was en-

abled. (Bug#15650)

- When running a query that contained a `GROUP_CONCAT(SELECT GROUP_CONCAT(. . .))`, the result was `NULL` except in the `ROLLUP` part of the result, if there was one. (Bug#15560)
- Use of `CONVERT_TZ()` in a view definition could result in spurious syntax or access errors. (Bug#15153)
- `CAST(double AS SIGNED INT)` for large `double` values outside the signed integer range truncates the result to be within range, but the result sometimes had the wrong sign, and no warning was generated. (Bug#15098)
- Server and clients ignored the `--sysconfdir` option that was passed to `configure`. (Bug#15069)
- `TRUNCATE` did not reset the `AUTO_INCREMENT` counter for `MyISAM` tables when issued inside a stored procedure.

Note

This bug did not affect `InnoDB` tables. Also, `TRUNCATE` does not reset the `AUTO_INCREMENT` counter for `NDB-Cluster` tables regardless of when it is called.

(Bug#14945)

See also Bug#18864

- For `InnoDB` tables, an expression of the form `col_name BETWEEN col_name2 - INTERVAL x DAY AND col_name2 + INTERVAL x DAY` when used in a join returned incorrect results. (Bug#14360)
- Prevent recursive views caused by using `RENAME TABLE` on a view after creating it. (Bug#14308)
- `INSERT DELAYED` into a view caused an infinite loop. (Bug#13683)
- Avoid trying to include `<asm/atomic.h>` when it doesn't work in C++ code. (Bug#13621)
- Within stored routines, usernames were parsed incorrectly if they were enclosed within quotes. (Bug#13310)
- The server was always built as though `--with-extra-charsets=complex` had been specified. (Bug#12076)

E.1.9. Changes in MySQL 5.0.20a (18 April 2006)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.20.

Additional information about SSL support

- Please note that the original 5.0.20 announcement included inexact wording: SSL support is “included” in both server and client, but by default not “enabled”. SSL can be enabled by passing the SSL-related options (`--ssl`, `--ssl-key=...`, `--ssl-cert=...`, `--ssl-ca=...`) when starting the server and the client or by specifying these options in an option file. For more information, see [Section 5.8.7, “Using Secure Connections”](#).
- With version 5.0.20a, SSL support is contained in all binaries for all Unix (including Linux) and Windows platforms except AIX, HP-UX, OpenServer 6, and the RPMs specific for RHAS3/RHAS4/SLES9 on Itanium CPUs ([ia64](#)); It is also not contained in those for Novell Netware. We are trying to add these platforms in future versions.

Bugs fixed:

- The fix for “Command line options are ignored for mysql client” has been revoked because it introduced an incompatible change in the way the `mysql` command-line client selects the server to connect to. In the worst case, this might have led to a client issuing commands to a server for which they were not intended, and this must not happen. To help all users in understanding this subject, [Section 4.2, “Invoking MySQL Programs”](#) now includes additional explanation of how command options with regard to host selection. (Bug#16855)
- The code of the `yaSSL` library has been improved to avoid the dependency on a C++ runtime library, so a link with pure C applications is now possible on additional (but not yet all) platforms. We are working on fixing the remaining issues.

E.1.10. Changes in MySQL 5.0.20 (31 March 2006)

Functionality added or changed:

- Builds for Windows, Linux, and Unix (except AIX) platforms now have SSL support enabled, in the server as well as in the client libraries. Because part of the SSL code is written in C++, this does introduce dependencies on the system's C++ runtime libraries in several cases, depending on compiler specifics. (Bug#18195)
- The `NDBCluster` storage engine now supports `INSERT IGNORE` and `REPLACE` statements. Previously, these statements failed with an error. (Bug#17431)
- Large file support added to build for `QNX` platform. (Bug#17336)
- `InnoDB`: The `InnoDB` storage engine now provides a descriptive error message if `ibdata` file information is omitted from `my.cnf`. (Bug#16827)
- Added the `--sysdate-is-now` option to `mysqld` to enable `SYSDATE()` to be treated as an alias for `NOW()`. See Section 11.6, “Date and Time Functions”. (Bug#15101)
- Large file support was re-enabled for the MySQL server binary for the AIX 5.2 platform. (Bug#13571)
- The syntax for `CREATE PROCEDURE` and `CREATE FUNCTION` statements now includes a `DEFINER` clause. The `DEFINER` value specifies the security context to be used when checking access privileges at routine invocation time if the routine has the `SQL SECURITY DEFINER` characteristic. See Section 18.2.1, “CREATE PROCEDURE and CREATE FUNCTION Syntax”, for more information.

When `mysqldump` is invoked with the `--routines` option, it now dumps the `DEFINER` value for stored routines.

Bugs fixed:

- **MySQL Cluster**: A timeout in the handling of an `ABORT` condition with more than 32 operations could yield a node failure. (Bug#18414)
- **MySQL Cluster**: A node restart immediately following a `CREATE TABLE` would fail.

Important

This fix supports 2-node Clusters only.

(Bug#18385)

- **MySQL Cluster**: In event of a node failure during a rollback, a “false” lock could be established on the backup for that node, which lock could not be removed without restarting the node. (Bug#18352)
- **MySQL Cluster**: The cluster created a crashed replica of a table having an ordered index — or when logging was not enabled, of a table having a table or unique index — leading to a crash of the cluster following 8 successive restarts. (Bug#18298)
- **MySQL Cluster**: When replacing a failed master node, the replacement node could cause the cluster to crash from a buffer overflow if it had an excessively large amount of data to write to the cluster log. (Bug#18118)
- **MySQL Cluster**: Certain queries using `ORDER BY ... ASC` in the `WHERE` clause could return incorrect results. (Bug#17729)
- **MySQL Cluster**: If a `mysql` or other client could not parse the result set returned from a `mysqld` process acting as an SQL node in a cluster, the client would crash instead of returning the appropriate error. For example, this could happen when the client attempted to use a character set was not available to the `mysqld`. (Bug#17380)
- **MySQL Cluster**: Some query cache statistics were not always correctly reported for Cluster tables. (Bug#16795)
- **MySQL Cluster**: Restarting nodes were allowed to start and join the cluster too early. (Bug#16772)
- **MySQL Cluster**: Inserting and deleting `BLOB` column values while a backup was in process could cause the loss of an `ndbd` node. (Bug#14028)
- A `SELECT ... ORDER BY ...` from a view defined using a function could crash the server. An example of such a view might be `CREATE VIEW AS SELECT SQRT(c1) FROM t1`. (Bug#18386)
- `InnoDB` had a memory leak for duplicate-key errors with tables having 90 columns or more. (Bug#18384)
- A `DELETE` using a subquery could crash the server. (Bug#18306)
- If a row was inserted inside a stored procedure using the parameters passed to the procedure in the `INSERT` statement, the resulting binlog entry was not escaped properly. (Bug#18293)

- If `InnoDB` encountered a `HA_ERR_LOCK_TABLE_FULL` error and rolled-back a transaction, the transaction was still written to the binary log. (Bug#18283)
- When using `ORDER BY` with a non-string column inside `GROUP_CONCAT()` the result's character set was converted to binary. (Bug#18281)
See also Bug#14169
- Complex queries with nested joins could cause a server crash. (Bug#18279)
- For `InnoDB` tables created in MySQL 4.1 or earlier, or created in 5.0 or later with compact format, updating a row so that a long column is updated or the length of some column changes, `InnoDB` later would fail to reclaim the `BLOB` storage space if the row was deleted. (Bug#18252)
- If `InnoDB` ran out of buffer space for row locks and adaptive hashes, the server would crash. Now `InnoDB` rolls back the transaction. (Bug#18238)
- Views that incorporated tables from the `INFORMATION_SCHEMA` database resulted in a server crash when queried. (Bug#18224)
- `REPAIR TABLE`, `OPTIMIZE TABLE`, and `ALTER TABLE` operations on transactional tables (or on tables of any type on Windows) could corrupt triggers associated with those tables. (Bug#18153)
- The server could deadlock under heavy load while writing to the binary log. (Bug#18116)
- A `SELECT *` query on an `INFORMATION_SCHEMA` table by a user with limited privileges resulted in a server crash. (Bug#18113)
- Connecting to a server with a UCS2 default character set with a client using a non-UCS2 character set crashed the server. (Bug#18004)
- `MyISAM`: Performing a bulk insert on a table referenced by a trigger would crash the table. (Bug#17764)
- Updating a view that filters certain rows to set a filtered out row to be included in the table caused infinite loop. For example, if the view has a `WHERE` clause of `salary > 100` then issuing an `UPDATE` statement of `SET salary = 200 WHERE id = 10`, caused an infinite loop. (Bug#17726)
- `MyISAM`: Keys for which the first part of the key was a `CHAR` or `VARCHAR` column using the UTF-8 character set and longer than 254 bytes could become corrupted. (Bug#17705)
- Updating the value of a Unicode `VARCHAR` column with the result returned by a stored function would cause the insertion of ASCII characters into the column instead of Unicode, even where the function's return type was also declared as Unicode. (Bug#17615)
- For `FEDERATED` tables, a `SELECT` statement with an `ORDER BY` clause did not return rows in the proper order. (Bug#17377)
- `SELECT ... WHERE column LIKE 'A%'`, when `column` had a key and used the `latin2_czech_cs` collation, caused the wrong number of rows to be returned. (Bug#17374)
- A `LEFT JOIN` with a `UNION` that selects literal values could crash the server. (Bug#17366)
- Checks for permissions on database operations could be performed in a case-insensitive manner (a user with permissions on database `MYDATABASE` could by accident get permissions on database `myDataBase`), if the privilege data were still cached from a previous check. (Bug#17279)
- Stored procedures that call UDFs and pass local string variables caused server crashes. (Bug#17261)
- If the `WHERE` condition of a query contained an `OR`-ed `FALSE` term, the set of tables whose rows cannot serve for null-complements in outer joins was determined incorrectly. This resulted in blocking possible conversions of outer joins into joins by the optimizer for such queries. (Bug#17164)
- Use of `TRUNCATE TABLE` for a `TEMPORARY` table on a master server was propagated to slaves properly, but slaves did not decrement the `Slave_open_temp_tables` counter properly. (Bug#17137)
- `InnoDB` tables with an adaptive hash blocked other queries during `CHECK TABLE` statements while the entire hash was checked. This could be a long time for a large hash. (Bug#17126)
- Stored routine names longer than 64 characters were silently truncated. Now the limit is properly enforced and an error occurs. (Bug#17015)
- `InnoDB`: The `LATEST FOREIGN KEY ERROR` section in the output of `SHOW INNODB STATUS` was sometimes format-

ted incorrectly, causing problems with scripts that parsed the output of this statement. (Bug#16814)

- If the server was started with the `--skip-grant-tables` option, it was impossible to create a trigger or a view without explicitly specifying a `DEFINER` clause. (Bug#16777)
- The `FORMAT()` function returned an incorrect result when the client's `character_set_connection` value was `utf8`. (Bug#16678)
- Using `ORDER BY intvar` within a stored procedure (where `intvar` is an integer variable or expression) would crash the server.

Note

The use of an integer `i` in an `ORDER BY i` clause for sorting the result by the `i`th column is deprecated (and non-standard). It should *not* be used in new applications. See Section 12.2.7, “`SELECT Syntax`”.

(Bug#16474)

- Replication slaves could not replicate triggers from older servers that included no `DEFINER` clause in the trigger definition. Now the trigger executes with the privileges of the invoker (which on the slave is the slave SQL thread). (Bug#16266)
- The `DEFINER` value for stored routines was not replicated. (Bug#15963)
- Character set conversion of string constants for `UNION` of constant and table column was not done when it was safe to do so. (Bug#15949)
- Triggers created in MySQL 5.0.16 and earlier could not be dropped after upgrading the server to 5.0.17 or later. (Bug#15921)
- The `mysql_close()` C API function leaked handles for shared-memory connections on Windows. (Bug#15846)
- `COUNT(DISTINCT col1, col2)` and `COUNT(DISTINCT CONCAT(col1, col2))` operations produced different results if one of the columns was an indexed `DECIMAL` column. (Bug#15745)
- A `SELECT` using a function against a nested view would crash the server. (Bug#15683)
- The server displayed garbage in the error message warning about bad assignments to `DECIMAL` columns or routine variables. (Bug#15480)
- During conversion from one character set to `ucs2`, multi-byte characters with no `ucs2` equivalent were converted to multiple characters, rather than to `0x003F QUESTION MARK`. (Bug#15375)
- Certain combinations of joins with mixed `ON` and `USING` clauses caused unknown column errors. (Bug#15229)
- `SELECT COUNT(*)` for a `MyISAM` table could return different results depending on whether an index was used. (Bug#14980)
- Attempting to access an `InnoDB` table after starting the server with `--skip-innodb` caused a server crash. (Bug#14575)
- Use of stored functions with `DISTINCT` or `GROUP BY` can produce incorrect results when `ORDER BY` is also used. (Bug#13575)
- The server would execute stored routines that had a non-existent definer. (Bug#13198)
- `mysql_config` returned incorrect libraries on `x86_64` systems. (Bug#13158)
- Loading of UDFs in a statically linked MySQL caused a server crash. UDF loading is now blocked if the MySQL server is statically linked. (Bug#11835)
- Large file support did not work in AIX server binaries. (Bug#10776)

E.1.11. Changes in MySQL 5.0.19 (04 March 2006)

Functionality added or changed:

- **Incompatible Change:** The `InnoDB` storage engine no longer ignores trailing spaces when comparing `BINARY` or `VARBINARY` column values. This means that (for example) the binary values `'a'` and `'a '` are now regarded as *unequal* any time they are compared, as they are in `MyISAM` tables.

See Section 10.4.2, “`The BINARY and VARBINARY Types`” for more information about the `BINARY` and `VARBINARY` types.

Bug#14189)

- **MySQL Cluster:** More descriptive warnings are now issued when inappropriate logging parameters are set in `config.ini`. (Formerly, the warning issued was simply `COULD NOT ADD LOGFILE DESTINATION`.) (Bug#11331)
- **MySQL Cluster:** The `ndb_mgm` client commands `node_id START` and `node_id STOP` now work with management nodes as well as data nodes. (However, using `ALL` for the `node_id` continues to affect all data nodes only.)
- `mysql` no longer terminates data value display when it encounters a NUL byte. Instead, it displays NUL bytes as spaces. (Bug#16859)
- New `charset` command added to `mysql` command-line client. By typing `charset name` or `\C name` (such as `\C UTF8`), the client character set can be changed without reconnecting. (Bug#16217)
- Added the `--wait-timeout` option to `mysqlmanager` to allow configuration of the timeout for dropping an inactive connection, and increased the default timeout from 30 seconds to 28,800 seconds (8 hours). (Bug#15980, Bug#12674)
- The `INFORMATION_SCHEMA` now skips data contained in unlistable/unreadable directories rather than returning an error. (Bug#15851)
- `InnoDB` now caches a list of unflushed files instead of scanning for unflushed files during a table flush operation. This improves performance when `--innodb_file_per_table` is set on a system with a large number of `InnoDB` tables. (Bug#15653)
- Added the `--port-open-timeout` option to `mysqld` to control how many seconds the server should wait for the TCP/IP port to become free if it cannot be opened. (Bug#15591)
- Wording of error 1329 changed to `NO DATA - ZERO ROWS FETCHED, SELECTED, OR PROCESSED`. (Bug#15206)
- The message for error 1109 changed from `UNKNOWN TABLE ... IN ORDER CLAUSE` to `UNKNOWN TABLE ... IN FIELD LIST`. (Bug#15091)
- A number of performance issues were resolved that had previously been encountered when using statements that repeatedly invoked stored functions. For example, calling `BENCHMARK()` using a stored function executed much more slowly than when invoking it with inline code that accomplished the same task. In most cases the two should now execute with approximately the same speed. (Bug#14946, Bug#15014)
- `mysqldump` now surrounds the `DEFINER`, `SQL SECURITY DEFINER` and `WITH CHECK OPTION` clauses of a `CREATE VIEW` statement with "not in version" comments to prevent errors in earlier versions of MySQL. (Bug#14871)
- When using the `GROUP_CONCAT()` function where the `group_concat_max_len` system variable was greater than 512, the type of the result was `BLOB` only if the query included an `ORDER BY` clause; otherwise the result was a `VARCHAR`.
The result type of the `GROUP_CONCAT()` function is now `VARCHAR` only if the value of the `group_concat_max_len` system variable is less than or equal to 512. Otherwise, this function returns a `BLOB`. (Bug#14169)
- The `mysql_ping` function will now retry if the `reconnect` flag is set and error `CR_SERVER_LOST` is encountered during the first attempt to ping the server. (Bug#14057)
- The `mysqltest` utility now converts all `CR/LF` combinations to `LF` to allow test cases intended for Windows to work properly on UNIX-like systems. (Bug#13809)
- `libmysqlclient` now uses versioned symbols with GNU ld. (Bug#3074)
- Client API will now attempt reconnect on TCP/IP if the `reconnect` flag is set, as is the case with sockets. (Bug#2845)
- Added the `--check-upgrade` to `mysqlcheck` that invokes `CHECK TABLE` with the `FOR UPGRADE` option.
- Added the `FOR UPGRADE` option for the `CHECK TABLE` statement. This option checks whether tables are incompatible with the current version of MySQL Server.
- Two new Hungarian collations are included: `utf8_hungarian_ci` and `ucs2_hungarian_ci`. These support the correct sort order for Hungarian vowels. However, they do not support the correct order for sorting Hungarian consonant contractions; this issue will be fixed in a future release.
- Several changes were made to make upgrades easier:
 - Added the `mysql_upgrade` program that checks all tables for incompatibilities with the current version of MySQL Server and repairs them if necessary. This program should be run for each MySQL upgrade (rather than `mysql_fix_privilege_tables`). See Section 5.5.8, "mysql_upgrade — Check Tables for MySQL Upgrade".

- Added the `FOR UPGRADE` option for the `CHECK TABLE` statement. This option checks whether tables are incompatible with the current version of MySQL Server.
- Added the `--check-upgrade` to `mysqlcheck` that invokes `CHECK TABLE` with the `FOR UPGRADE` option.
- Added the `mysql_upgrade` program that checks all tables for incompatibilities with the current version of MySQL Server and repairs them if necessary. This program should be run for each MySQL upgrade (rather than `mysql_fix_privilege_tables`). See [Section 5.5.8, “mysql_upgrade — Check Tables for MySQL Upgrade”](#).

Bugs fixed:

- **MySQL Cluster:** Cluster log file paths were truncated to 128 characters. They may now be as long as `MAX_PATH` (the maximum path length permitted by the operating system). ([Bug#17411](#))
- **MySQL Cluster:** Following multiple forced shutdowns and restarts of data nodes, `DROP DATABASE` could fail. ([Bug#17325](#))
- **MySQL Cluster:** The `REDO` log would become corrupted (and thus unreadable) in some circumstances, due to a failure in the query handler. ([Bug#17295](#))
- **MySQL Cluster:** An `UPDATE` with an inner join failed to match any records if both tables in the join did not have a primary key. ([Bug#17257](#))
- **MySQL Cluster:** A `DELETE` with a join in the `WHERE` clause failed to retrieve any records if both tables in the join did not have a primary key. ([Bug#17249](#))
- **MySQL Cluster:** In some cases, `LOAD DATA INFILE` did not load all data into `NDB` tables. ([Bug#17081](#))
- **MySQL Cluster:** `ndb_delete_all` would run out of memory on tables containing `BLOB` columns. ([Bug#16693](#))
- **MySQL Cluster:** `UNIQUE` keys in Cluster tables were limited to 225 bytes in length. ([Bug#15918](#))
- **MySQL Cluster:** No error message was generated for setting `NoOfFragmentLogFiles` too low. ([Bug#13966](#))
- **MySQL Cluster:** No error message was generated for setting `MaxNoOfAttributes` too low. ([Bug#13965](#))
- `type_decimal` failed with the prepared statement protocol. ([Bug#17826](#))
- The MySQL server could crash with out of memory errors when performing aggregate functions on a `DECIMAL` column. ([Bug#17602](#))
- Using `DROP FUNCTION IF EXISTS func_name` to drop a user-defined function caused a server crash if the server was running with the `--skip-grant-tables` option. ([Bug#17595](#))
- Data truncations on non-`UNIQUE` indexes could crash `InnoDB` when using multi-byte character sets. ([Bug#17530](#))
- A natural join between `INFORMATION_SCHEMA` tables failed. ([Bug#17523](#))
- A stored procedure failed to return data the first time it was called per connection. ([Bug#17476](#))
- For certain `MERGE` tables, the optimizer wrongly assumed that using `index_merge/intersection` was too expensive. ([Bug#17314](#))
- The error message returned by `pererror --ndb` was prefixed with `OS ERROR CODE:` instead of `NDB ERROR CODE:`. ([Bug#17235](#))
- The parser allowed `CREATE AGGREGATE FUNCTION` for creating stored functions, even though `AGGREGATE` does not apply. (It is used only for `CREATE FUNCTION` only when creating user-defined functions.) ([Bug#16896](#))
- Cursors in stored routines could cause a server crash. ([Bug#16887](#))
- Triggers created without `BEGIN` and `END` clauses resulted in “You have an error in your SQL syntax” errors when dumping and replaying a binary log. ([Bug#16878](#))
- Using `ALTER TABLE` to increase the length of a `BINARY(M)` column caused column values to be padded with spaces rather than `0x00` bytes. ([Bug#16857](#))
- A `RETURN` statement within a trigger caused a server crash. `RETURN` now is disallowed within triggers. To exit immediately, use `LEAVE`. ([Bug#16829](#))

- For a MySQL 5.0 server, using MySQL 4.1 tables in queries with a `GROUP BY` clause could result in buffer overrun or a server crash. (Bug#16752)
- An `INSERT` statement in a stored procedure corrupted the binary log. (Bug#16621)
- If the query optimizer transformed a `GROUP BY` clause in a subquery, it did not also transform the `HAVING` clause if there was one, producing incorrect results. (Bug#16603)
- In a highly concurrent environment, a server crash or deadlock could result from execution of a statement that used stored functions or activated triggers coincident with alteration of the tables used by these functions or triggers. (Bug#16593)
- Corrected race condition when dropping the adaptive hash index for a B-tree page in `InnoDB`. (Bug#16582)
- When evaluation of the test in a `CASE` failed in a stored procedure that contained a `CONTINUE` handler, execution resumed at the beginning of the `CASE` statement instead of at the end. (Bug#16568)
- For a transaction that used `MyISAM` and `InnoDB` tables, interruption of the transaction due to a dropped connection on a master server caused slaves to lose synchrony. (Bug#16559)
- Clients compiled from source with the `--without-readline` did not save command history from session to session. (Bug#16557)
- The `DECIMAL` data type was not being handled correctly with prepared statements. (Bug#16511)
- Instance Manager searched wrong location for password file on some platforms. (Bug#16499)
- `UPDATE` statement crashed multi-byte character set `FULLTEXT` index if update value was almost identical to initial value only differing in some spaces being changed to ` `. (Bug#16489)
- The `--replicate-do` and `--replicate-ignore` options were not being enforced on multiple-table statements. (Bug#16487, Bug#15699)
- Certain nested `LEFT JOIN` operations were not properly optimized. (Bug#16393)
- Server crash when dropping `InnoDB` constraints named `TABLENAME_ibfk_0`. (Bug#16387)
- `SELECT` with `GROUP BY` on a view can cause a server crash. (Bug#16382)
- An invalid stored routine could not be dropped. (Bug#16303)
- `InnoDB`: After upgrading an `InnoDB` table having a `VARCHAR BINARY` column created in MySQL 4.0 to MySQL 5.0, update operations on the table would cause the server to crash. (Bug#16298)
- Parallel builds occasionally failed on Solaris. (Bug#16282)
- A call to the `IF ()` function using decimal arguments could return incorrect results. (Bug#16272)
- MySQL server dropped client connection for certain `SELECT` statements against views defined that used `MERGE` algorithm. (Bug#16260)
- `InnoDB` used full explicit table locks in trigger processing. (Bug#16229)
- Using `GROUP BY` on column used in `WHERE` clause could cause empty set to be returned. (Bug#16203)
- A memory leak caused warnings on slaves for certain statements that executed without warning on the master. (Bug#16175)
- The `FORCE INDEX` keyword in a query would prevent an index merge from being used where an index merge would normally be chosen by the optimizer. (Bug#16166)
- Setting `InnoDB` path settings to an empty string caused `InnoDB` storage engine to crash upon server startup. (Bug#16157)
- The `mysql_stmt_sqlstate()` C API function incorrectly returned an empty string rather than `'00000'` when no error occurred. (Bug#16143)
- `NDBCluster`: A bitfield whose offset and length totaled 32 would crash the cluster. (Bug#16125)
- `MIN()` and `MAX()` operations were not optimized for views. (Bug#16016)
- Performing a `RENAME TABLE` on an `InnoDB` table when the server is started with the `--innodb_file_per_table` option and the data directory is a symlink caused a server crash. (Bug#15991)
- Executing a `SHOW CREATE VIEW` query of an invalid view caused the `mysql_next_result()` function of

`libMySQL.dll` to hang. (Bug#15943)

- `NDBCluster`: Upon the completion of a scan where a key request remained outstanding on the primary replica and a starting node died, the scan did not terminate. This caused incompleting error handling of the failed node. (Bug#15908)
- Test suite `sp` test left behind tables when the test failed that could cause future tests to fail. (Bug#15866)
- `STR_TO_DATE(1, NULL)` caused a server crash. (Bug#15828, CVE-2006-3081)
- `CAST(... AS TIME)` operations returned different results when using versus not using prepared-statement protocol. (Bug#15805)
- Issuing a `DROP USER` command could cause some users to encounter a `hostname is not allowed to connect to this MySQL server` error. (Bug#15775)
- The contents of `fill_help_tables.sql` could not be loaded in strict SQL mode. (Bug#15760)
- `fill_help_tables.sql` was not included in binary distributions for several platforms. (Bug#15759)
- Certain `LEAVE` statements in stored procedures were not properly optimized. (Bug#15737)
- The `mysql_real_connect()` C API function incorrectly reset the `MYSQL_OPT_RECONNECT` option to its default value. (Bug#15719)
- Created a user function with an empty string (that is, `CREATE FUNCTION ''()`), was accepted by the server. Following this, calling `SHOW FUNCTION STATUS` would cause the server to crash. (Bug#15658)
- A `DELETE` statement involving a `LEFT JOIN` and an `IS NULL` test on the right-hand table of the join crashed the server when the `innodb_locks_unsafe_for_binlog` option was enabled. (Bug#15650)
- Trying to compile the server on Windows generated a stack overflow warning due to a recursive definition of the internal `Field_date::store()` method. (Bug#15634)
- In some cases the query optimizer did not properly perform multiple joins where inner joins followed left joins, resulting in corrupted result sets. (Bug#15633)
- `NDBCluster`: The `ndb_autodiscover` test failed sporadically due to a node not being permitted to connect to the cluster. (Bug#15619)
- Certain permission management statements could create a `NULL` hostname for a user, resulting in a server crash. (Bug#15598)
- Improper memory handling for stored routine variables could cause memory overruns and binary log corruption. (Bug#15588)
- The `COALESCE()` function truncated data in a `TINYTEXT` column. (Bug#15581)
- Binary distributions for Solaris contained files with group ownership set to the non-existing `wheel` group. Now the `bin` group is used. (Bug#15562)
- The absence of a table in the left part of a left or right join was not checked prior to name resolution, which resulted in a server crash. (Bug#15538)
- A `SELECT` of a stored function that references the `INFORMATION_SCHEMA` could crash the server. (Bug#15533)
- Characters in the `gb2312` and `euckr` character sets which did not have Unicode mappings were truncated. (Bug#15377)
- Certain subqueries where the inner query is the result of an aggregate function would return different results on MySQL 5.0 than on MySQL 4.1. (Bug#15347)
- Subselect could return wrong results when records cache and grouping was involved. (Bug#15347)
- Performing an `ORDER BY` on an indexed `ENUM` column returned error. (Bug#15308)
- A `SELECT` query which contained a `GROUP_CONCAT()` and an `ORDER BY` clause against the `INFORMATION_SCHEMA` resulted in an empty result set. (Bug#15307)
- The `NOT FOUND` condition handler for stored procedures did not distinguish between a `NOT FOUND` condition and an exception or warning. (Bug#15231)
- The `SELECT` privilege was required for triggers that performed no selects. (Bug#15196)
- An attempt to open a table that requires a disabled storage engine could cause a server crash. (Bug#15185)

- The `UPDATE` privilege was required for triggers that performed no updates. (Bug#15166)
- Tarball install package was missing a proper `fill_help_tables.sql` file. (Bug#15151)
- Setting `innodb_log_file_size` to a value greater than 4G crashed the server. (Bug#15108)
- NDB Cluster returned incorrect `Can't find file` error for OS error 24, changed to `Too many open files`. (Bug#15020)
- When multiple handlers are created for the same MySQL error number within nested blocks, the outermost handler took precedence. (Bug#15011)
- A statement containing `GROUP BY` and `HAVING` clauses could return incorrect results when the `HAVING` clause contained logic that returned `FALSE` for every row. (Bug#14927)
- Stored routines that contained only a single statement were not written properly to the dumpfile when using `mysqldump`. (Bug#14857)
- Killing a long-running query containing a subquery could cause a server crash. (Bug#14851)
- `GRANT` statements specifying schema names that included underscore characters (i.e. `my_schema`) did not match if the underscore was escaped in the `GRANT` statement (i.e. `GRANT ALL ON `my_schema` ...`). (Bug#14834)
- Previously, a stored function invocation was written to the binary log as `DO func_name()` if the invocation changes data and occurs within a non-logged statement, or if the function invokes a stored procedure that produces an error. These invocations now are logged as `SELECT func_name()` instead for better control over error code checking (slave servers could stop due to detecting a different error than occurred on the master). (Bug#14769)
- Generating an `AUTO_INCREMENT` value through a `FEDERATED` table did not set the value returned by `LAST_INSERT_ID()`. (Bug#14768)
- `SUBSTRING_INDEX()` could yield inconsistent results when applied with the same arguments to consecutive rows in a query. (Bug#14676)
- Running out of disk space in the location specified by the `tmpdir` option resulted in incorrect error message. (Bug#14634)
- InnoDB: Comparison of indexed `VARCHAR CHARACTER SET ucs2 COLLATE ucs2_bin` columns using `LIKE` could fail. (Bug#14583)
- A stored procedure with an undefined variable and an exception handler would hang the client when called. (Bug#14498)
- A `FULLTEXT` query in a prepared statement could result in unexpected behavior. (Bug#14496)
- Using an aggregate function as the argument for a `HAVING` clause would result in the aggregate function always returning `FALSE`. (Bug#14274)
- The use of `LOAD INDEX` within a stored routine was permitted and caused the server to crash.

Note

`LOAD INDEX` statements within stored routines *are not supported*, and now yield an error if attempted. This behavior is intended.

(Bug#14270)

- A `COMMIT` statement followed by a `ALTER TABLE` statement on a BDB table caused server crash. (Bug#14212)
- The `mysql_stmt_store_result()` C API function could not be used for a prepared statement if a cursor had been opened for the statement. (Bug#14013)
- `SET sql_mode = N`, where $N > 31$, did not work properly. (Bug#13897)
- Attempts to create `FULLTEXT` indexes on `VARCHAR` columns larger than 1000 bytes resulted in error. (Bug#13835)
- The `RENAME TABLE` statement did not move triggers to the new table. (Bug#13525)
- `BIT` fields were not properly handled when using row-based replication. (Bug#13418)
- The length of a `VARCHAR()` column that used the `utf8` character set would increase each time the table was re-created in a stored procedure or prepared statement, eventually causing the `CREATE TABLE` statement to fail. (Bug#13134)

- Instance Manager erroneously accepted a list of instance identifiers for the `START INSTANCE` and `STOP INSTANCE` commands (should accept only a single identifier). (Bug#12813)
- A prepared statement created from a `SELECT ... LIKE` query (such as `PREPARE stmt1 FROM 'SELECT col_1 FROM tedd_test WHERE col_1 LIKE ?';`) would begin to produce erratic results after being executed repeatedly numerous (thousands) of times. (Bug#12734)
- Multi-byte path names for `LOAD DATA` and `SELECT ... INTO OUTFILE` caused errors. Added the `character_set_filesystem` system variable, which controls the interpretation of string literals that refer to filenames. (Bug#12448)
- Temporary table aliasing did not work inside stored functions. (Bug#12198)
- `NDBCluster`: When running more than one management process in a cluster:
 - `ndb_mgm -c host:port -e "node_id stop"` would stop a management process running only on the same system on which the command was issued.
 - `ndb_mgm -e "shutdown"` failed to shut down any management processes at all.(Bug#12124, Bug#12045)
- The embedded server did not allow binding of columns to the `MYSQL_TYPE_VAR_STRING` data type in prepared statements. (Bug#12070)
- When MyODBC or any other client called `my_init()/my_end()` several times, it caused corruption of charset data stored in `once_mem_pool`. (Bug#11892)
- Setting the `myisam_repair_threads` system variable to a value larger than 1 could cause corruption of large `MyISAM` tables. (Bug#11527)
- The `mysqlbinlog` utility did not output `DELIMITER` statements, causing syntax errors for stored routine creation statements. (Bug#11312)
- The embedded server failed various tests in the automated test suite. (Bug#10801, Bug#10925, Bug#15433, Bug#9633, Bug#10926, Bug#9631, Bug#10930, Bug#10911, Bug#9630, Bug#10924)
- A large `BIGINT` value specified in a `WHERE` clause could be treated differently depending on whether it is specified as a quoted string. (For example, `WHERE bigint_col = 1766600000000000000` versus `WHERE bigint_col = '1766600000000000000'`). (Bug#9088)
- `CHECKSUM TABLE` returned different values on `MyISAM` table depending on whether the `QUICK` or `EXTENDED` options were used. (Bug#8841)
- Using the `TRUNCATE()` function with a negative number for the second argument on a `BIGINT` column returned incorrect results. (Bug#8461)
- Issuing `GRANT EXECUTE` on a procedure would display any warnings related to the creation of the procedure. (Bug#7787)
- Repeated invocation of `my_init()` and `my_end()` caused corruption of character set data and connection failure. (Bug#6536)
- An `INSERT ... SELECT` statement between tables in a `MERGE` set can return errors when statement involves insert into child table from merge table or vice-versa. (Bug#5390)
- `ndb_mgm -c host:port -e "node_id stop"` would stop a management process running only on the same system on which the command was issued.
- `ndb_mgm -e "shutdown"` failed to shut down any management processes at all.

E.1.12. Changes in MySQL 5.0.18 (21 December 2005)

Functionality added or changed:

- The server treats stored routine parameters and local variables (and stored function return values) according to standard SQL. Previously, parameters, variables, and return values were treated as items in expressions and were subject to automatic (silent) conversion and truncation. Now the data type is observed. Data type conversion and overflow problems that occur in assignments result in warnings, or errors in strict mode. The `CHARACTER SET` clause for character data type declarations is used. Parameters, variables, and return values must be scalars; it is no longer possible to assign a row value. Also, stored functions

execute using the `sql_mode` value in force at function creation time rather than ignoring it. For more information, see [Section 18.2.1, “CREATE PROCEDURE and CREATE FUNCTION Syntax”](#). (Bug#13808, Bug#12903, Bug#9078, Bug#14161, Bug#13705, Bug#13909, Bug#15148, Bug#8769, Bug#8702, Bug#9572, Bug#8768)

- It is now possible to build the server such that `MyISAM` tables can support up to 128 keys rather than the standard 64. This can be done by configuring the build using the option `--with-max-indexes=N`, where `N#128` is the maximum number of indexes to permit per table. (Bug#10932)

Bugs fixed:

- **MySQL Cluster:** If an abort by the Transaction Coordinator timed out, the abort condition was incorrectly handled, causing the transaction record to be released prematurely. (Bug#15685)

- **MySQL Cluster:** The `ndb_read_multi_range.test` script failed to drop a table, causing the test to fail. (Bug#15675)

See also [Bug#15402](#)

- **MySQL Cluster:** Under some circumstances, it was possible for a restarting node to undergo a forced shutdown. (Bug#15632)
- **MySQL Cluster:** A node which failed during cluster startup was sometimes not removed from the internal list of active nodes. (Bug#15587)

- When a connection using `yaSSL` was aborted, the server would continue to try to read the closed socket, and the thread continued to appear in the output of `SHOW PROCESSLIST`. Note that this issue did not affect secure connection attempts using `OpenSSL`. (Bug#15772)

- API function `mysql_stmt_prepare` returned wrong field length for `TEXT` columns. (Bug#15613)

- **InnoDB:** Having two tables in a parent-child relationship enforced by a foreign key where one table used `ROW_FORMAT=COMPACT` and the other used `ROW_FORMAT=REDUNDANT` could result in a MySQL server crash. Note that this problem did not exist prior to MySQL 5.0.3, when the compact row format for **InnoDB** was introduced. (Bug#15550)

- **BDB:** A `DELETE`, `INSERT`, or `UPDATE` of a **BDB** table could cause the server to crash where the query contained a subquery using an index read. (Bug#15536)

- Resolution of the argument to the `VALUES()` function to a variable inside a stored routine caused a server crash. The argument must be a table column. (Bug#15441)

- A left join on a column that having a `NULL` value could cause the server to crash. (Bug#15268)

- The output of `mysqldump --triggers` did not contain the `DEFINER` clause in dumped trigger definitions. (Bug#15110)

- Reversing the order of operands in a `WHERE` clause testing a simple equality (such as `WHERE t1.col1 = t2.col2`) would produce different output from `EXPLAIN`. (Bug#15106)

- The output of `SHOW TRIGGERS` contained extraneous whitespace. (Bug#15103)

- Creating a trigger caused a server crash if the table or trigger database was not known because no default database had been selected. (Bug#14863)

- Column aliases were displayed incorrectly in a `SELECT` from a view following an update to a base table of the view. (Bug#14861)

- A replication slave server could sometimes crash on a `BEFORE UPDATE` trigger if the `UPDATE` query was not executed in the same database as the table with the trigger. (Bug#14614)

- `SHOW [FULL] COLUMNS` and `SHOW INDEX FROM` did not function with temporary tables. (Bug#14271, Bug#15224, Bug#14387)

- The `INFORMATION_SCHEMA.COLUMNS` table did not report the size of `BINARY` or `VARBINARY` columns. (Bug#14271)

- **InnoDB:** If `FOREIGN_KEY_CHECKS` was 0, **InnoDB** allowed inconsistent foreign keys to be created. (Bug#13778)

- The server would not compile under `Cygwin`. (Bug#13640)

- `DESCRIBE` did not function with temporary tables. (Bug#12770)

- Set functions could not be aggregated in outer subqueries. (Bug#12762)

- A race condition when creating temporary files caused a deadlock on Windows with threads in `Opening tables` or `Waiting for table` states. ([Bug#12071](#))

E.1.13. Changes in MySQL 5.0.17 (14 December 2005)

Functionality added or changed:

- The syntax for `CREATE TRIGGER` now includes a `DEFINER` clause for specifying which access privileges to check at trigger invocation time. See [Section 19.1](#), “`CREATE TRIGGER Syntax`”, for more information.

Known issue: If you attempt to replicate from a master server older than MySQL 5.0.17 to a slave running MySQL 5.0.17 through 5.0.19, replication of `CREATE TRIGGER` statements fails on the slave with a `Definer not fully qualified` error. A workaround is to create triggers on the master using a version-specific comment embedded in each `CREATE TRIGGER` statement:

```
CREATE /*!50017 DEFINER = 'root'@'localhost' */ TRIGGER ... ;
```

`CREATE TRIGGER` statements written this way will replicate to newer slaves, which pick up the `DEFINER` clause from the comment and execute successfully. ([Bug#16266](#))

- The original Linux RPM packages (5.0.17-0) had an issue with a `zlib` dependency that would result in an error during an install or upgrade. They were replaced by new binaries, 5.0.17-1. Here is a list of the new RPM binaries:
 - `MySQL-{Max,client,devel,server,shared,ndb*}-5.0.17-1.i386.rpm`
 - `MySQL-*-standard-5.0.17-1.rhel3.i386.rpm`, `MySQL-*-standard-5.0.17-1.rhel3.ia64.rpm`, `MySQL-*-standard-5.0.17-1.rhel3.x86_64.rpm`
 - `MySQL-*-pro-5.0.17-1.rhel3.i386.rpm`, `MySQL-*-pro-5.0.17-1.rhel3.ia64.rpm`, `MySQL-*-pro-5.0.17-1.rhel3.x86_64.rpm`
 - `MySQL-*-pro-gpl-5.0.17-1.rhel3.i386.rpm`, `MySQL-*-pro-gpl-5.0.17-1.rhel3.ia64.rpm`, `MySQL-*-pro-gpl-5.0.17-1.rhel3.x86_64.rpm` ([Bug#15223](#))
 - Support files for compiling with Visual Studio 6 have been removed. ([Bug#15094](#))
 - In the `latin5_turkish_ci` collation, the order of the characters `A WITH CIRCUMFLEX`, `I WITH CIRCUMFLEX`, and `U WITH CIRCUMFLEX` was changed. If you have used these characters in any indexed columns, you should rebuild those indexes. ([Bug#13421](#))
 - Recursion is allowed in stored procedures. Recursive stored functions and triggers still are disallowed. ([Bug#10100](#))
 - `MySQL-*-pro-5.0.17-1.rhel3.i386.rpm`, `MySQL-*-pro-5.0.17-1.rhel3.ia64.rpm`, `MySQL-*-pro-5.0.17-1.rhel3.x86_64.rpm`
 - `MySQL-*-pro-gpl-5.0.17-1.rhel3.i386.rpm`, `MySQL-*-pro-gpl-5.0.17-1.rhel3.ia64.rpm`, `MySQL-*-pro-gpl-5.0.17-1.rhel3.x86_64.rpm`
 - Added a `DEFINER` column to the `INFORMATION_SCHEMA.TRIGGERS` table.
 - Invoking a stored function or trigger creates a new savepoint level. When the function or trigger finishes, the previous savepoint level is restored.
- See also [Bug#13825](#)
- The maximum key length for `InnoDB` indexes was increased from 1024 bytes to 3072 bytes for all builds. (In MySQL 5.0.15, the length was increased but only for 64-bit builds.)
 - `MySQL-{Max,client,devel,server,shared,ndb*}-5.0.17-1.i386.rpm`
 - `MySQL-*-standard-5.0.17-1.rhel3.i386.rpm`, `MySQL-*-standard-5.0.17-1.rhel3.ia64.rpm`, `MySQL-*-standard-5.0.17-1.rhel3.x86_64.rpm`
 - Added the `SHOW FUNCTION CODE` and `SHOW PROCEDURE CODE` statements (available only for servers that have been built with debugging support). See [Section 12.5.4.19](#), “`SHOW PROCEDURE CODE and SHOW FUNCTION CODE Syntax`”.

Bugs fixed:

- **MySQL Cluster:** A forced cluster shutdown occurred when the management daemon was restarted with a changed `config.ini` file that added an API/SQL node. (Bug#15512)
- **MySQL Cluster:** There was a small window for a node failure to occur during a backup without an error being reported. (Bug#15425)
- **MySQL Cluster:** Using `ORDER BY primary_key_column` when selecting from a table having the primary key on a `VARCHAR` column caused a forced shutdown of the cluster. (Bug#15240, Bug#15682, Bug#14828, Bug#15517)
- **MySQL Cluster:** Under certain circumstances, when `mysqld` connects to a cluster management server, the connection would fail before a node ID could be allocated. (Bug#15215)
- **MySQL Cluster:** Creating a table with packed keys failed silently. `NDB` now supports the `PACK_KEYS` option to `CREATE TABLE` correctly. (Bug#14514)
- **MySQL Cluster:** `REPLACE` failed when attempting to update a primary key value in a Cluster table. (Bug#14007)
- Slave SQL thread cleanup was not handled properly on Mac OS X when a statement was killed, resulting in a slave crash. (Bug#16900)
- Corrected an error-handling problem within stored routines on 64-bit platforms. (Bug#15630)
- The `CREATE` test case in `mysql-test-run.pl` failed on AIX and SCO. (Bug#15607)
- A bug in `mysql-test/t/mysqltest.test` caused that test to fail. (Bug#15605)
- A statement that produced a warning, when fetched via `mysql_stmt_fetch()`, did not produce a warning count according to `mysql_warning_count()`. (Bug#15510)
- The database-changing code for stored routine handling caused an error-handling problem resulting in a server crash. (Bug#15392)
- RPM packages had an incorrect `zlib` dependency. (Bug#15223)
- `mysqld` would not start on Windows 9X operating systems including Windows Me. (Bug#15209)
- Queries that select records based on comparisons to a set of column could crash the server if there was one index covering the columns, and a set of other non-covering indexes that taken together cover the columns. (Bug#15204)
- Selecting from a view processed with the temptable algorithm caused a server crash if the query cache was enabled. (Bug#15119)
- `mysql --help` was missing a newline after the version string when the bundled `readline` library was not used. (Bug#15097)
- Creating a view that referenced a stored function that selected from a view caused a crash upon selection from the view. (Bug#15096)
- The server crashed if compiled without any transactional storage engines. (Bug#15047)
- Multiple-table update operations were counting updates and not updated rows. As a result, if a row had several updates it was counted several times for the “rows matched” value but updated only once. (Bug#15028)
- Symbolic links did not function properly on Windows platforms. (Bug#14960, Bug#14310)
- `ROW_COUNT()` returned an incorrect result after `EXECUTE` of a prepared statement. (Bug#14956)
- When using an aggregate function to select from a table that has a multiple-column primary key, adding `ORDER BY` to the query could produce an incorrect result. (Bug#14920)
- `ANALYZE TABLE` did not properly update table statistics for a `MyISAM` table with a `FULLTEXT` index containing stopwords, so a subsequent `ANALYZE TABLE` would not recognize the table as having already been analyzed. (Bug#14902)
- Creating a view within a stored procedure could result in an out of memory error or a server crash. (Bug#14885)
- `GROUP BY` on a view column did not correctly account for the possibility that the column could contain `NULL` values. (Bug#14850)
- The `mysql_stmt_fetch()` C APP function could return `MYSQL_NO_DATA` for a `SELECT COUNT(*) FROM tbl_name WHERE 1 = 0` statement, which should return 1 row. (Bug#14845)

- Selecting from a view used `filesort` retrieval when faster retrieval was possible. (Bug#14816)
- InnoDB: A race condition allowed two threads to drop a hash index simultaneously. (Bug#14747)
- `SHOW CREATE TABLE` for a view could fail if the client had locked the view. (Bug#14726)
- The grammar for supporting the `DEFINER = CURRENT_USER` clause in `CREATE VIEW` and `ALTER VIEW` was incorrect. (Bug#14719)
- `ALTER TABLE ... SET DEFAULT` had no effect. (Bug#14693)
- Using `ORDER BY` on a column from a view, when also selecting the column normally, and via an alias, caused a mistaken `Column 'x' in order clause is ambiguous` error. (Bug#14662)
- `SELECT` queries that began with an opening parenthesis were not being placed in the query cache. (Bug#14652)
- In a stored procedure, continuing (via a condition handler) after a failed variable initialization caused a server crash. (Bug#14643)
- A `LIMIT`-related optimization failed to take into account that `MyISAM` table indexes can be disabled, causing Error 124 when it tried to use such an index. (Bug#14616)
- `mysqlhotcopy` tried to copy `INFORMATION_SCHEMA` tables. (Bug#14610)
- A server crash resulted from the following sequence of events: 1) With no default database selected, create a stored procedure with the procedure name explicitly qualified with a database name (`CREATE PROCEDURE db_name.proc_name ...`). 2) Create another stored procedure with no database name qualifier. 3) Execute `SHOW PROCEDURE STATUS`. (Bug#14569)
- `mysqldump --triggers` did not account for the SQL mode and could dump trigger definitions with missing whitespace if the `IGNORE_SPACE` mode was enabled. (Bug#14554)
- `CREATE TABLE tbl_name (...) SELECT ...` could crash the server and write invalid data into the `.frm` file if the `CREATE TABLE` and `SELECT` both contained a column with the same name. Also, if a default value is specified in the column definition, it is now actually used. (Bug#14480)
- The value of `INFORMATION_SCHEMA.TABLES.TABLE_TYPE` sometimes was reported as empty. (Bug#14476)
- `mysql_fix_privilege_tables.sql` contained an erroneous comment that resulted in an error when the file contents were processed. (Bug#14469)
- Queries on `ARCHIVE` tables that used the `filesort` sorting method could result in a server crash. (Bug#14433)
- Creating a table containing an `ENUM` or `SET` column from within a stored procedure or prepared statement caused a server crash later when executing the procedure or statement. (Bug#14410)
- For a table that had been opened with `HANDLER OPEN`, issuing `OPTIMIZE TABLE`, `ALTER TABLE`, or `REPAIR TABLE` caused a server crash. (Bug#14397)
- Declaring a stored routine variable to have a `DEFAULT` value that referred to a variable of the same name caused a server crash. (For example: `DECLARE x INT DEFAULT x`) Now the `DEFAULT` variable is interpreted as referring to a variable in an outer scope, if there is one. (Bug#14376)
- Complex subqueries could cause improper internal query execution environment initialization and crash the server. (Bug#14342)
- Within a stored procedure, inserting with `INSERT ... SELECT` into a table with an `AUTO_INCREMENT` column did not generate the correct sequence number. (Bug#14304)
- Space truncation was being ignored when inserting into `BINARY` or `VARBINARY` columns. Now space truncation results in a warning, or an error in strict mode. (Bug#14299)
- Casting a `FLOAT` or `DOUBLE` whose value was less than `1.0E-06` to `DECIMAL` would yield an inappropriate value. (Bug#14268)
- `CAST(expr AS BINARY(N))` did not pad with `0x00` to a length of `N` bytes. (Bug#14255)
- Manual manipulation of the `mysql.proc` table could cause a server crash. This should not happen, but it is also not supported that the server will notice such changes. (Bug#14233)
- A `UNION` of `DECIMAL` columns could produce incorrect results. (Bug#14216)

- The maximum value of `MAX_ROWS` was handled incorrectly on 64-bit systems. (Bug#14155)
- `CHAR(... USING ...)` and `CONVERT(CHAR(...) USING ...)`, though logically equivalent, could produce different results. (Bug#14146)
- The server could misinterpret old trigger definition files created before MySQL 5.0.17. Now they are interpreted correctly, but this takes more time and the server issues a warning that the trigger should be re-created. (Bug#14090)
- Stored functions making use of cursors were not replicated. (Bug#14077)
- For a invalid view definition, selecting from the `INFORMATION_SCHEMA.VIEWS` table or using `SHOW CREATE VIEW` failed, making it difficult to determine what part of the definition was invalid. Now the server returns the definition and issues a warning. (Bug#13818)
- `InnoDB`: Activity on an `InnoDB` table caused execution time for `SHOW CREATE TABLE` for the table to increase. (Bug#13762)
- Within a stored procedure, exception handling for `UPDATE` statements that caused a duplicate-key error caused a `Packets out of order` error for the following statement. (Bug#13729)
- Statements that implicitly commit a transaction are prohibited in stored functions and triggers. An attempt to create a function or trigger containing such a statement produces an error. (The originally reported symptom was that a trigger that dropped another trigger could cause a server crash. That problem was fixed by the patch for Bug#13343.) (Bug#13627)
- A newline character in a column alias in a view definition caused an error when selecting from the view later. (Bug#13622)
- Invoking a stored procedure within another stored procedure caused the server to crash. (Bug#13549)
- Warnings from a previous command were not being reset when fetching from a cursor. (Bug#13524)
- In some cases, a left outer join could yield an invalid result or cause the server to crash, due to a `MYSQL_DATA_TRUNCATED` error. (Bug#13488)
- `DELETE` from `CSV` tables reported an incorrect rows-affected value. (Bug#13406)
- A server crash could occur if a prepared statement updated a table for which a trigger existed when the statement was prepared but had been dropped prior to statement execution. (Bug#13399)
- `RESET MASTER` failed to delete log files on Windows. (Bug#13377)
- For binary string data types, `mysqldump --hex-blob` produced an illegal output value of `0x` rather than `' '`. (Bug#13318)
- `REPAIR TABLES`, `BACKUP TABLES`, `RESTORE TABLES` within a stored procedure caused a server crash. (Bug#13012)
- Implicit versus explicit conversion of float to integer (such as inserting a float value into an integer column versus using `CAST(... AS UNSIGNED)` before inserting the value) could produce different results. Implicit and explicit typecasts now are done the same way, with a value equal to the nearest integer according to the prevailing rounding mode. (Bug#12956)
- Some comparisons for the `IN()` operator were inconsistent with equivalent comparisons for the `=` operator. (Bug#12612)
- A server crash could occur if a prepared statement invoked a stored procedure that existed when the statement was prepared but had been dropped and re-created prior to statement execution. (Bug#12329)
- `make` failed when attempting to build MySQL in different directory than source. (Bug#11827)
- On Windows, the server could crash during shutdown if both replication threads and normal client connection threads were active. (Bug#11796)
- Revised table locking to allow proper assessment of view security. (Bug#11555)
- Perform character set conversion of constant values whenever possible without data loss. (Bug#10446)
- `InnoDB`: During replication, There was a failure to record events in the binary log that still occurred even in the event of a `ROLLBACK`. For example, this sequence of commands:

```
BEGIN;  
CREATE TEMPORARY TABLE t1 (a INT) ENGINE=INNODB;  
ROLLBACK;  
INSERT INTO t1 VALUES (1);
```

would succeed on the replication master as expected. However, the `INSERT` would fail on the slave because the `ROLLBACK` would (erroneously) cause the `CREATE TEMPORARY TABLE` statement not to be written to the binlog. (Bug#7947)

- Within a trigger definition the `CURRENT_USER()` function evaluated to the user whose actions caused the trigger to be activated. Now that triggers have a `DEFINER` value, `CURRENT_USER()` evaluates to the trigger definer. (Bug#5861)
- `mysql` ignored the `MYSQL_TCP_PORT` environment variable. (Bug#5792)

E.1.14. Changes in MySQL 5.0.16 (10 November 2005)

Functionality added or changed:

- When a date column is set `NOT NULL` and contains `0000-00-00`, it will be updated for `UPDATE` statements that contains `columnname IS NULL` in the `WHERE` clause. (Bug#14186)
- When trying to run the server with `yaSSL` enabled, `MySQL` now tries to open `/dev/random` automatically if `/dev/urandom` is not available. (Bug#13164)
- `MySQL 5.0` now supports character set conversion for seven additional `cp950` characters into the `big5` character set: `0xF9D6`, `0xF9D7`, `0xF9D8`, `0xF9D9`, `0xF9DA`, `0xF9DB`, and `0xF9DC`.

Note

If you move data containing these additional characters to an older `MySQL` installation which does not support them, you may encounter errors.

(Bug#12476)

- You must now declare a prefix for an index on any column of any `Geometry` class, the only exception being when the column is a `POINT`. (Bug#12267)
- The `read_only` system variable no longer applies to `TEMPORARY` tables. (Bug#4544)
- Due to changes in binary logging, the restrictions on which stored routine creators can be trusted not to create unsafe routines have been lifted for stored procedures (but not stored functions). Consequently, the `log_bin_trust_routine_creators` system variable and the corresponding `--log-bin-trust-routine-creators` server option were renamed to `log_bin_trust_function_creators` and `--log-bin-trust-function-creators`. For backward compatibility, the old names are recognized but result in a warning. See [Section 18.4, “Binary Logging of Stored Routines and Triggers”](#).
- The `CHECK TABLE` statement now works for `ARCHIVE` tables.
- Added a `--hexdump` option to `mysqlbinlog` that displays a hex dump of the log in comments. This output can be helpful for replication debugging.
- In `MySQL 5.0.13`, syntax for `DEFINER` and `SQL SECURITY` clauses was added to the `CREATE VIEW` and `ALTER VIEW` statements, but the clauses had no effect. They now are enabled. They specify the security context to be used when checking access privileges at view invocation time. See [Section 20.2, “CREATE VIEW Syntax”](#), for more information.
- The `InnoDB`, `NDB`, `BDB`, and `ARCHIVE` storage engines now support spatial columns. See [Chapter 17, Spatial Extensions](#).
- Added the `Compression` status variable, which indicates whether the client connection uses compression in the client/server protocol.

Bugs fixed:

- **MySQL Cluster:** Repeated transactions using unique index lookups could cause a memory leak leading to error 288, `Out of index operations in transaction coordinator`. (Bug#14199)
- **MySQL Cluster:** A memory leak occurred when performing ordered index scans using indexes a columns larger than 32 bytes, which would eventually lead to the forced shutdown of all `mysqld` server processes used with the cluster. (Bug#13078)
- For some stored functions dumped by `mysqldump --routines`, the function definition could not be reloaded later due to a parsing error. (Bug#14723)
- Deletes from a `CSV` table could cause table corruption. (Bug#14672)
- Executing `REPAIR TABLE`, `ANALYZE TABLE`, or `OPTIMIZE TABLE` on a view for which an underlying table had been dropped caused a server crash. (Bug#14540)

- `mysqlmanager` did not start up correctly on Windows 2003. (Bug#14537)
- Selecting from a table in both an outer query and a subquery could cause a server crash. (Bug#14482)
- `ORDER BY DESC` within the `GROUP_CONCAT()` function was not honored when used in a view. (Bug#14466)
- The input polling loop for Instance Manager did not sleep properly. Instance Manager used up too much CPU as a result. (Bug#14388)
- Indexes for `BDB` tables were being limited incorrectly to 255 bytes. (Bug#14381)
- The `mysql` parser did not properly strip the delimiter from input lines less than nine characters long. For example, this could cause `USE abc;` to result in an `Unknown database: abc;` error. (Bug#14358)
- The displayed value for the `CHARACTER_MAXIMUM_LENGTH` column in the `INFORMATION_SCHEMA.COLUMNS` table was not adjusted for multi-byte character sets. (Bug#14290)
- The parser did not correctly recognize wildcards in the host part of the `DEFINER` user in `CREATE VIEW` statements. (Bug#14256)
- Memory corruption and a server crash could be caused by statements that used a cursor and generated a result set larger than `max_heap_table_size`. (Bug#14210)
- A bugfix in MySQL 5.0.15 caused the displayed values for the `CHARACTER_MAXIMUM_LENGTH` and `CHARACTER_OCTET_LENGTH` columns in the `INFORMATION_SCHEMA.COLUMNS` table to be reversed. (Bug#14207)
- Statements of the form `CREATE TABLE ... SELECT ...` that created a column with a multi-byte character set could incorrectly calculate the maximum length of the column, resulting in a `Specified key was too long` error. (Bug#14139)
- Use of `WITH ROLLUP PROCEDURE ANALYSE()` could hang the server. (Bug#14138)
- On Windows, the value of `character_sets_dir` in `SHOW VARIABLES` output was displayed inconsistently (using both “/” and “\” as pathname component separators). (Bug#14137)
- A comparison with an invalid date (such as `WHERE col_name > '2005-09-31'`) caused any index on `col_name` not to be used and a string comparison for each row, resulting in slow performance. (Bug#14093)
- Subqueries in the `FROM` clause failed if the current database was `INFORMATION_SCHEMA`. (Bug#14089)
- For `InnoDB` tables, using a column prefix for a `utf8` column in a primary key caused `Cannot find record` errors when attempting to locate records. (Bug#14056)
- Some updatable views could not be updated. (Bug#14027)
- A prepared statement that selected from a view processed using the merge algorithm could crash on the second execution. (Bug#14026)
- When the `DATE_FORMAT()` function appeared in both the `SELECT` and `ORDER BY` clauses of a query but with arguments that differ by case (i.e. `%m` and `%M`), incorrect sorting may have occurred. (Bug#14016)
- `TIMEDIFF()`, `ADDTIME()`, and `STR_TO_DATE()` were not reporting that they could return `NULL`, so functions that invoked them might misinterpret their results. (Bug#14009)
- Within stored routines, `REPLACE()` could return an empty string (rather than the original string) when no replacement was done, and `IFNULL()` could return garbage results. (Bug#13941)
- Inserting a new row into an `InnoDB` table could cause `DATETIME` values already stored in the table to change. (Bug#13900)
- An update of a `CSV` table could cause a server crash. (Bug#13894)
- Corrected a parser precedence problem that resulted in an `Unknown column ... in 'on clause'` error for some joins. (Bug#13832)
- Trying to take the logarithm of a negative value is now handled in the same fashion as division by zero. That is, it produces a warning when `ERROR_FOR_DIVISION_BY_ZERO` is set, and an error in strict mode. (Bug#13820)
- The example configuration files supplied with MySQL distributions listed the `thread_cache_size` variable as `thread_cache`. (Bug#13811)
- `mysqld_safe` did not correctly start the `-max` version of the server (if it was present) if the `--ledir` option was given. (Bug#13774)

- `SHOW CREATE TABLE` did not display the `CONNECTION` string for `FEDERATED` tables. (Bug#13724)
- For a `MyISAM` table originally created in MySQL 4.1, `INSERT DELAYED` could cause a server crash. (Bug#13707)
- The server incorrectly accepted column definitions of the form `DECIMAL(0,D)` for `D` less than 11. (Bug#13667)
- Trying to create a stored routine with no database selected would crash the server. (Bug#13587, Bug#13514)
- Inserts of too-large `DECIMAL` values were handled inconsistently (sometimes set to the maximum `DECIMAL` value, sometimes set to 0). (Bug#13573)
- `TIMESTAMPDIFF()` returned an incorrect result if one argument but not the other was a leap year and a date was from March or later. (Bug#13534)
- Specifying `--default-character-set=cp-932` for `mysqld` would cause SQL scripts containing comments written using that character set to fail with a syntax error. (Bug#13487)
- Use of `col_name = VALUES(col_name)` in the `ON DUPLICATE KEY UPDATE` clause of an `INSERT` statement failed with an `Column 'col_name' in field list is ambiguous` error. (Bug#13392)
- The default value of `query_prealloc_size` was set to 8192, lower than its minimum of 16384. The minimum has been lowered to 8192. (Bug#13334)
- `InnoDB`: When dropping and adding a `PRIMARY KEY`, if a loose index scan using only the second part of multiple-part index was chosen, incorrect keys were created and an endless loop resulted. (Bug#13293)
- `mysqladmin` and `mysqldump` would hang on SCO OpenServer. (Bug#13238)
- `SELECT DISTINCT CHAR(col_name)` returned incorrect results after `SET NAMES utf8`. (Bug#13233)
- For queries with nested outer joins, the optimizer could choose join orders that query execution could not handle. The fix is that now the optimizer avoids choosing such join orders. (Bug#13126)
- The server did not take character set into account in checking the width of the `mysql.user.Password` column. As a result, it could incorrectly generate long password hashes even if the column was not long enough to hold them. (Bug#13064)
- Trying to compile the server using the `--without-geometry` option caused the build to fail. (Bug#12991)
- Use of the deprecated `--sql-bin-update-same` option caused a server crash. (Bug#12974)
- Maximum values were handled incorrectly for command-line options of type `GET_LL`. (Bug#12925)
- `mysqldump` could not dump views if the `-x` option was given. (Bug#12838)
- Two threads that were creating triggers on an `InnoDB` table at the same time could deadlock. (Bug#12739)
- `InnoDB`: Large `innobase_buffer_pool_size` and `innobase_log_file_size` values were displayed incorrectly on 64-bit systems. (Bug#12701)
- For `LIKE ... ESCAPE`, an escape sequence longer than one character was accepted as valid. Now the sequence must be empty or one character long. If the `NO_BACKSLASH_ESCAPES` SQL mode is enabled, the sequence must be one character long. (Bug#12595)
- Inserting `cp932` strings into a `VARCHAR` column caused a server crash rather than string truncation if the string was longer than the column definition. (Bug#12547)
- A prepared statement failed with `Illegal mix of collations` if the client character set was `utf8` and the statement used a table that had a character set of `latin1`. (Bug#12371)
- Using `ALTER TABLE` to add an index could fail if the operation ran out of temporary file space. Now it automatically makes a second attempt that uses a slower method but no temporary file. In this case, problems that occurred during the first attempt can be displayed with `SHOW WARNINGS`. (Bug#12166)
- `mysqlimport` now issues a `SET @@character_set_database = binary` statement before loading data so that a file containing mixed character sets (columns with different character sets) can be loaded properly. (Bug#12123)
- Running `OPTIMIZE TABLE` and other data-updating statements concurrently on an `InnoDB` table could cause a crash or the following warnings in the error log: `Warning: Found locks from different threads in write: enter write_lock, Warning: Found locks from different threads in write: start of release lock`. (Bug#11704)

- `LOAD DATA INFILE` would not accept the same character for both the `ESCAPED BY` and the `ENCLOSED BY` clauses. (Bug#11203)
- The value of `Last_query_cost` was not updated for queries served from the query cache. (Bug#10303)
- Starting `mysqld` with the `--skip-innodb` and `--default-storage-engine=innodb` (or `--default-table-type=innodb`) caused a server crash. (Bug#9815)
- The `--exit-info=65536` option conflicted with `--temp-pool` and caused problems with the server's use of temporary files. Now `--temp-pool` is ignored if `--exit-info=65536` is specified. (Bug#9551)
- For a user that has the `SELECT` privilege on a view, the server erroneously was also requiring the user to have the `EXECUTE` privilege at view execution time for stored functions used in the view definition. (Bug#9505)
- Where one stored procedure called another stored procedure: If the second stored procedure generated an exception, the exception was not caught by the calling stored procedure. For example, if stored procedure `A` used an `EXIT` statement to handle an exception, subsequent statements in `A` would be executed regardless when `A` was called by another stored procedure `B`, even if an exception that should have been handled by the `EXIT` was generated in `A`. (Bug#7049)
- On Windows, the server was not ignoring hidden or system directories that Windows may have created in the data directory, and would treat them as available databases. (Bug#4375)

E.1.15. Changes in MySQL 5.0.15 (19 October 2005: Production)

Functionality added or changed:

- **MySQL Cluster:** The `ndb_mgm` client now reports node startup phases automatically. (Bug#16197)
- **MySQL Cluster:** The `pererror` utility included with the `MySQL-Server` RPM now provides support for the `--ndb` option, and so can be used to obtain error message text for MySQL Cluster error codes. (Bug#13740)
- The following statements now cause an implicit `COMMIT`:
 - `CREATE VIEW`
 - `ALTER VIEW`
 - `DROP VIEW`
 - `CREATE TRIGGER`
 - `DROP TRIGGER`
 - `CREATE USER`
 - `RENAME USER`
 - `DROP USER`(Bug#13343)
- Added the `--tz-utc` option to `mysqldump`. This option adds `SET TIME_ZONE= '+00:00'` to the dump file so that `TIMESTAMP` columns can be dumped and reloaded between servers in different time zones and protected from changes due to daylight saving time. (Bug#13052)
- **NDBCluster:** A new “smart” node allocation algorithm means that it is no longer necessary to use sequential IDs for cluster nodes, and that nodes not explicitly assigned IDs should now have IDs allocated automatically in most cases. In practical terms, this means that it is now possible to assign a set of node IDs such as `1, 2, 4, 5` without an error being generated due to the missing `3`. (Bug#13009)
- When executing single-table `UPDATE` or `DELETE` queries containing an `ORDER BY ... LIMIT N` clause, but not having any `WHERE` clause, MySQL can now take advantage of an index to read the first `N` rows in the ordering specified in the query. If an index is used, only the first `N` records will be read, as opposed to scanning the entire table. (Bug#12915)
- The `MySQL-server` RPM now explicitly assigns the `mysql` system user to the `mysql` user group during the postinstallation process. This corrects an issue with upgrading the server on some Linux distributions whereby a previously existing `mysql` user was not changed to the `mysql` group, resulting in wrong groups for files created following the installation. (Bug#12823)
- **NDBCluster:** A number of new or improved error messages have been implemented in this release in order to provide better

and more accurate diagnostic information regarding cluster configuration issues and problems. ([Bug#12786](#), [Bug#11749](#), [Bug#13197](#), [Bug#11739](#), [Bug#12044](#))

- `CREATE VIEW`
- The maximum key length for `InnoDB` indexes was increased from 1024 bytes to 3072 bytes for 64-bit builds.
- `DROP USER`
- `DROP VIEW`
- **Warning: Incompatible change.** For `BINARY` columns, the pad value and how it is handled has changed. The pad value for inserts now is `0x00` rather than space, and there is no stripping of the pad value for selects. For details, see [Section 10.4.2](#), “The `BINARY` and `VARBINARY` Types”.
- `DROP TRIGGER`
- `CREATE USER`
- `ALTER VIEW`
- `CREATE TRIGGER`
- When declaring a local variable (or parameter) named `password` or `name`, and setting it with `SET` (for example, `SET password = ''`), the new error message `ERROR 42000: Variable 'nnn' must be quoted with `...`, or renamed` is returned (where 'nnn' is 'password' or 'names'). This means there is a syntax conflict with special sentences like `SET PASSWORD = PASSWORD(...)` (for setting a user's password) and `set names default` (for setting charset and collation).

This must be resolved either by quoting the variable name: `SET `password` = ...`, which will set the local variable ``password``, or by renaming the variable to something else (if setting the user's password is the desired effect).

- `RENAME USER`
- **Warning: Incompatible change.** The `CHAR()` function now returns a binary string rather than a string in the connection character set. An optional `USING charset` clause may be used to produce a result in a specific character set instead. Also, arguments larger than 256 produce multiple characters. They are no longer interpreted modulo 256 to produce a single character each. These changes may cause some incompatibilities, as noted in [Section 2.4.17.2](#), “Upgrading from MySQL 4.1 to 5.0”.

Bugs fixed:

- Tests containing `SHOW TABLE STATUS` or `INFORMATION_SCHEMA` failed on `opnsrv6c`. ([Bug#14064](#), [Bug#14065](#))
- `mysqldump` could not dump views. ([Bug#14061](#))
- `mysqlcheck --all-databases --analyze --optimize` failed because it also tried to analyze and optimize the `INFORMATION_SCHEMA` tables which it can't. ([Bug#13783](#))
- Character set conversion was not being done for `FIND_IN_SET()`. ([Bug#13751](#))
- On BSD systems, the system `crypt()` call could return an error for some salt values. The error was not handled, resulting in a server crash. ([Bug#13619](#))
- When calling a stored procedure with the syntax `CALL schema.procedurename` and no default schema selected, `ERROR 1046` was displayed after the procedure returned. ([Bug#13616](#))
- `NDBCluster`: Placing multiple `[TCP DEFAULT]` sections in the cluster `config.ini` file crashed `ndb_mgmd`. (The `ndb_mgmd` process now exits gracefully with an appropriate error message instead.) ([Bug#13611](#))
- A column in the `ON` condition of a join that referenced a table in a nested join could not be resolved if the nested join was a right join. ([Bug#13597](#))
- Server may over-allocate memory when performing a `FULLTEXT` search for stopwords only. ([Bug#13582](#))
- `CREATE DEFINER=... VIEW ...` caused the server to crash when run with `--skip-grant-tables`. ([Bug#13504](#))
- `InnoDB`: Queries that were executed using an `index_merge` union or intersection could produce incorrect results if the underlying table used the `InnoDB` storage engine and had a primary key containing `VARCHAR` members. ([Bug#13484](#))
- `NDBCluster`: `ndb_mgmd` would allow a node to be stopped or restarted while another node was still starting up, which could

crash the cluster. It should now not be possible to issue a node stop or restart while a different node is still restarting, and the cluster management client issues an error if an attempt is made to do so. (Bug#13461)

- A qualified reference to a view column in the `HAVING` clause could not be resolved. (Bug#13410)
- `CAST(1E+300 TO SIGNED INT)` produced an incorrect result on little-endian machines. (Bug#13344)
- Queries that use indexes in normal `SELECT` statements may cause range scans in `VIEWS`. (Bug#13327)
- `SELECT * INTO OUTFILE ... FROM INFORMATION_SCHEMA.schemata` failed with an `Access denied` error. (Bug#13202)
- `mysqldump --triggers` did not quote identifiers properly if the `--compatible` option was given, so the dump output could not be reloaded. (Bug#13146)
- A table or view named Ç (C-cedilla) couldn't be dropped. (Bug#13145)
- For XA transaction IDs (`gtrid.bqual.formatID`), uniqueness is supposed to be assessed based on `gtrid` and `bqual`. MySQL was also including `formatID` in the uniqueness check. (Bug#13143)
- Trying to create a view dynamically using a prepared statement within a stored procedure failed with error 1295. (Bug#13095)
- `comp_err` did not detect when multiple error messages for a language were given for an error symbol. (Bug#13071)
- If special characters such as `'_'`, `'%'`, or the escape character were included within the prefix of a column index, `LIKE` pattern matching on the indexed column did not return the correct result. (Bug#13046, Bug#13919)
- Using an undefined variable in an `IF` or `SET` clause inside a stored routine produced an incorrect `unknown column ... in 'order clause'` error message. (Bug#13037)
- With `--log-slave-updates` `Exec_master_log_pos` of SQL thread lagged IO (Bug#13023)
- `SHOW CREATE TABLE` did not display any `FOREIGN KEY` clauses if a temporary file could not be created. Now `SHOW CREATE TABLE` displays an error message in an SQL comment if this occurs. (Bug#13002)
- Local (non-XA) and XA transactions are supposed to be mutually exclusive within a given client connection, but this prohibition was not always enforced. (Bug#12935)
- Server crashed during a `SELECT` statement, writing a message like this to the error log:

```
InnoDB: Error: MySQL is trying to perform a SELECT
InnoDB: but it has not locked any tables in ::external_lock()!
```

(Bug#12736)

- An `UPDATE` query using a join would be executed incorrectly on a replication slave. (Bug#12618)
- An expression in an `ORDER BY` clause failed with `Unknown column 'col_name' in 'order clause'` if the expression referred to a column alias. (Bug#11694)
- Issuing `STOP SLAVE` after having acquired a global read lock with `FLUSH TABLES WITH READ LOCK` caused a deadlock. Now `STOP SLAVE` generates an error in such circumstances. (Bug#10942)
- Corrected a memory-copying problem for `big5` values when using `icc` compiler on Linux IA-64 systems. (Bug#10836)
- `NDBCluster`: Trying to run `ndbd` as system `root` when connecting to a `mysqld` process running as the `mysql` system user via SHM caused the `ndbd` process to crash. (`ndbd` should now exit gracefully with an appropriate error message instead.) (Bug#9249)
- The `--interactive-timeout` and `--slave-net-timeout` options for `mysqld` were not being obeyed on Mac OS X and other BSD-based platforms. (Bug#8731)
- Queries of the form `(SELECT ...) ORDER BY ...` were being treated as a `UNION`. This improperly resulted in only distinct values being returned (because `UNION` by default eliminates duplicate results). Also, references to column aliases in `ORDER BY` clauses following parenthesized `SELECT` statements were not resolved properly. (Bug#7672)
- Character set file parsing during `mysql_real_connect()` read past the end of a memory buffer. (Bug#6413)

E.1.16. Changes in MySQL 5.0.14 (Not released)

Functionality added or changed:

- Multiple-table `UPDATE` and `DELETE` statements that do not affect any rows are now written to the binary log and will replicate. (Bug#13348, Bug#12844)
- Range scans can now be performed for queries on VIEWS such as `column IN (<constants>)` and `column BETWEEN ConstantA AND ConstantB`. (Bug#13317)
- The limit of 255 characters on the input buffer for `mysql` on Windows has been lifted. The exact limit depends on what the system allows, but can be up to 64K characters. A typical limit is 16K characters. (Bug#12929)
- Added the `myisam_stats_method`, which controls whether `NULL` values in indexes are considered the same or different when collecting statistics for `MyISAM` tables. This influences the query optimizer as described in Section 6.4.7, “`MyISAM Index Statistics Collection`”. (Bug#12232)
- The `CHAR()` function now takes into account the character set and collation given by the `character_set_connection` and `collation_connection` system variables. For an argument `n` to `CHAR()`, the result is `n mod 256` for single-byte character sets. For multi-byte character sets, `n` must be a valid code point in the character set. Also, the result string from `CHAR()` is checked for well-formedness. For invalid arguments, or a result that is not well-formed, MySQL generates a warning (or, in strict SQL mode, an error). (Bug#10504)
- Re-enabled the `--delayed-inserts` option for `mysqldump`, which now checks for each table dumped whether its storage engine supports `DELAYED` inserts. (Bug#7815)
- `RENAME TABLE` now works for views as well, as long as you do not try to rename a view into a different database. (Bug#5508)
- Configure-time checking for the availability of multi-byte macros and functions in the bundled `readline` library. This improves handling of multi-byte character sets in the `mysql` client. (Bug#3982)
- When an `InnoDB` foreign key constraint is violated, the error message now indicates which table, column, and constraint names are involved. (Bug#3443)

Bugs fixed:

- **MySQL Cluster:** If `ndb_restore` could not find a free `mysqld` process, it crashed. (Bug#13512)
- **MySQL Cluster:** Adding an index to a table with a large number of columns (more than 100) crashed the storage node. (Bug#13316)
- **MySQL Cluster:** Queries on `NDB` tables that are executed using `index_merge/union` or `index_merge/intersection` could produce incorrect results. (Bug#13081)
- **MySQL Cluster:** Receipt of several `enter single user mode` commands by multiple `ndb_mgmd` processes within a short period of time resulted in cluster shutdown. (Bug#13053)
- **MySQL Cluster:** Multiple `ndb_mgmd` processes in a cluster would not know each other's IP addresses. (Bug#12037)
- **MySQL Cluster:** With two `mgmd` processes in a cluster, `ndb_mgmd` output for `SHOW` would display the same IP address for both processes, even when they were on different hosts. (Bug#11595)
- **MySQL Cluster:** `LOAD DATA INFILE` with a large data file failed. (Bug#10694)
- Certain joins using `Range checked for each record` in the query execution plan could cause the server to crash. (Bug#24776)
- **NDBCluster:** A trigger updating the value of an `AUTO_INCREMENT` column in a Cluster table would insert an error code rather than the expected value into the column. (Bug#13961)
- Joins nested under `NATURAL` or `USING` joins were sometimes not initialized properly, causing a server crash. (Bug#13545)
- After running `configure` with the `--with-embedded-privilege-control` option, the embedded server failed to build. (Bug#13501)
- The optimizer chose a less efficient execution plan for `col_name BETWEEN const AND const` than for `col_name = const`, even though the two expressions are logically equivalent. Now the optimizer can use the `ref` access method for both expressions. (Bug#13455)
- Locking a view with the query cache enabled and `query_cache_wlock_invalidate` enabled could cause a server crash. (Bug#13424)

- A `HAVING` clause that references an unqualified view column name could crash the server. (Bug#13411)
- The `--skip-innodb-doublewrite` option disables use of the `InnoDB` doublewrite buffer. However, having this option in effect when creating a new MySQL installation prevented the buffer from even being created, resulting in a server crash later. (Bug#13367)
- Calling the `FORMAT()` function with a `DECIMAL` column value caused a server crash when the value was `NULL`. (Bug#13361)
- Comparisons involving row constructors containing constants could cause a server crash. (Bug#13356)
- Aggregate functions sometimes incorrectly were allowed in the `WHERE` clause of `UPDATE` and `DELETE` statements. (Bug#13180)
- `BIT` columns and following columns in `NDB` tables were corrupt when dumped by `mysqldump`. (Bug#13152)
- `NATURAL` joins and joins with `USING` against a view could return `NULL` rather than the correct value. (Bug#13127)
- For queries with `DISTINCT` and `WITH ROLLUP`, the `DISTINCT` should be applied after the rollup operation, but was not always. (Bug#12887)
- It was possible to create a view that executed a stored function for which you did not have the `EXECUTE` privilege. (Bug#12812)
- Shared-memory connections were not working on Windows. (Bug#12723)
- The server was not rejecting `FLOAT(M,D)` or `DOUBLE(M,D)` columns specifications when `M` was less than `D`. (Bug#12694)
- `CHECKSUM TABLE` locked `InnoDB` tables and did not use a consistent read. (Bug#12669)
- Incorrect creation of `DECIMAL` local variables in a stored procedure could cause a server crash. (Bug#12589)
- For queries for which the optimizer determined a join type of “Range checked for each record” (as shown by `EXPLAIN`, the query sometimes could cause a server crash, depending on the data distribution. (Bug#12291)
- After running `configure` with the `--without-server` option, the distribution failed to build. (Bug#11680, Bug#13550)
- Use of a user-defined function within the `HAVING` clause of a query resulted in an `Unknown column` error. (Bug#11553)
- The server crashed when processing a view that invoked the `CONVERT_TZ()` function. (Bug#11416)
- When `SELECT ... FOR UPDATE` or `SELECT ... LOCK IN SHARE MODE` for an `InnoDB` table were executed from within a stored function or a trigger, they were converted to a non-locking consistent read. (Bug#11238)
- The `--replicate-rewrite-db` and `--replicate-do-table` options did not work for statements in which tables were aliased to names other than those listed by the options. (Bug#11139)
- `NDBCluster`: When performing a delete of a great many (tens of thousands of) rows at once from a Cluster table, an improperly dereferenced pointer could cause the `mysqld` process to crash. (Bug#9282)
- Queries against a `MERGE` table that has a composite index could produce incorrect results. (Bug#9112)
- MySQL programs in binary distributions for Solaris 8/9/10 x86 systems would not run on Pentium III machines. (Bug#6772)
- Nested handlers within stored procedures didn't work. (Bug#6127)

E.1.17. Changes in MySQL 5.0.13 (22 September 2005: Release Candidate)

Functionality added or changed:

- `OPTIMIZE TABLE` and `HANDLER` now are prohibited in stored procedures and functions and in triggers. (Bug#12953, Bug#12995)
- The `LEAST()` and `GREATEST()` functions used to return `NULL` only if all arguments were `NULL`. Now they return `NULL` if any argument is `NULL`, the same as Oracle. (Bug#12791)
- `InnoDB`: The `TRUNCATE TABLE` statement for `InnoDB` tables always resets the counter for an `AUTO_INCREMENT` column now, regardless of whether there is a foreign key constraint on the table. (Beginning with 5.0.3, `TRUNCATE TABLE` reset the counter, but only if there was no such constraint.) (Bug#11946)

- Reorder network startup to come after all other initialization, particularly storage engine startup which can take a long time. This also prevents MySQL from being run on a privileged port (any port under 1024) unless run as the root user. (Bug#11707)
- A new command line argument was added to `mysqld` to ignore client character set information sent during handshake, and use server side settings instead, to reproduce 4.0 behavior :

```
mysqld --skip-character-set-client-handshake
```

 (Bug#9948)
- Added a `--routines` option for `mysqldump` that enables dumping of stored routines. (Bug#9056)
- The restriction on the use of `PREPARE`, `EXECUTE`, and `DEALLOCATE PREPARE` within stored procedures was lifted. The restriction still applies to stored functions and triggers. (Bug#7115, Bug#10975, Bug#10605)
- `RAND()` no longer allows non-constant initializers. (Prior to MySQL 5.0.13, the effect of non-constant initializers is undefined.) (Bug#6172)
- Better detection of connection timeout for replication servers on Windows allows elimination of extraneous `Lost connection` errors in the error log. (Bug#5588)
- The syntax for `CREATE VIEW` and `ALTER VIEW` statements now includes `DEFINER` and `SQL SECURITY` clauses for specifying the security context to be used when checking access privileges at view invocation time. (The syntax is present in 5.0.13, but these clauses have no effect until 5.0.16.) See Section 20.2, “`CREATE VIEW Syntax`”, for more information.
- The `--hex-dump` option for `mysqldump` now also applies to `BIT` columns.
- Two new collations have been added for Esperanto: `utf8_esperanto_ci` and `ucs2_esperanto_ci`.
- The Windows binary packages are now compiled with the Microsoft Visual Studio 2003 compiler instead of Microsoft Visual C++ 6.0.
- The connection string for `FEDERATED` tables now is specified using a `CONNECTION` table option rather than a `COMMENT` table option.
- The binaries compiled with the Intel `icc` compiler are now built using `icc 9.0` instead of `icc 8.1`. You will have to install new versions of the Intel `icc` runtime libraries, which are available from here: (<http://dev.mysql.com/downloads/os-linux.html>)

Bugs fixed:

- Local variables in stored routines were not always initialized correctly. (Bug#13133)
- The `FEDERATED` storage engine does not support `ALTER TABLE`, but no appropriate error message was issued. (Bug#13108)
- Columns named in the `USING()` clause of `JOIN ... USING()` were incorrectly resolved in case-sensitive fashion. (Bug#13067)
- The NDB `START BACKUP` command could be interrupted by a `SHOW` command. (Bug#13054)
- For a server compiled with `yaSSL`, clients that used MySQL Connector/J were not able to establish SSH connections. (Bug#13029)
- When used in view definitions, `DAYNAME(expr)`, `DAYOFWEEK(expr)`, `WEEKDAY(expr)` were incorrectly treated as though the expression was `TO_DAYS(expr)` or `TO_DAYS(TO_DAYS(expr))`. (Bug#13000)
- Using `AS` to rename a column selected from a view in a subquery made it not possible to refer to that column in the outer query. (Bug#12993)
- Using an `INOUT` parameter with a `DECIMAL` data type in a stored procedure caused a server crash. (Bug#12979)
- `SELECT ... JOIN ... ON ... JOIN ... USING` caused a server crash. (Bug#12977)
- A bug introduced in MySQL 5.0.12 caused `SHOW TABLE STATUS` to display an `Auto_increment` value of 0 for `InnoDB` tables. (Bug#12973)
- On HP-UX 11.x (PA-RISC), the `-L` option caused `mysqlimport` to crash. (Bug#12958)
- `InnoDB`: A consistent read could return inconsistent results due to a bug introduced in MySQL 5.0.5. (Bug#12947)
- Incorrect implicit nesting of joins caused the parser to fail on queries of the form `SELECT ... FROM t1 JOIN t2 JOIN`

- `t3 ON t1.t1col = t3.t3col` with an Unknown column 't1.t1col' in 'on clause' error. (Bug#12943)
- Incorrect results could be returned from a view processed using a temporary table. (Bug#12941)
- Multiplying a `DECIMAL` value within a loop in a stored routine could incorrectly result in a value of `NULL`. (Bug#12938)
- Using `GROUP BY` when selecting from a view in some cases could cause incorrect results to be returned. (Bug#12922)
- The counters for the `Key_read_requests`, `Key_reads`, `Key_write_requests`, and `Key_writes` status variables were changed from `unsigned long` to `unsigned longlong` to accommodate larger values before the variables roll over and restart from 0. (Bug#12920)
- `mysql` and `mysqldump` were ignoring the `--defaults-extra-file` option. (Bug#12917)
- `SHOW FIELDS FROM schemaname.viewname` caused error 1046 when no default schema was set. (Bug#12905)
- `UNION [DISTINCT]` was not removing all duplicates for multi-byte character values. (Bug#12891)
- A column that can be `NULL` was not handled properly for `WITH ROLLUP` in a subquery or view. (Bug#12885)
- Within a transaction, the following statements now cause an implicit commit: `CREATE FUNCTION`, `DROP FUNCTION`, `DROP PROCEDURE`, `ALTER FUNCTION`, `ALTER PROCEDURE`, `CREATE PROCEDURE`. This corrects a problem where these statements followed by `ROLLBACK` might not be replicated properly. (Bug#12870)
- `GROUP_CONCAT()` ignored an empty string if it was the first value to occur in the result. (Bug#12863)
- If a client has opened an `InnoDB` table for which the `.ibd` file is missing, `InnoDB` would not honor a `DROP TABLE` statement for the table. (Bug#12852)
- Within a stored procedure, a server crash was caused by assigning to a `VARCHAR INOUT` parameter the value of an expression that included the variable itself. (For example, `SET c = c.`) (Bug#12849)
- The server crashed when one thread resized the query cache while another thread was using it. (Bug#12848)
- A concurrency problem for `CREATE ... SELECT` could cause a server crash. (Bug#12845)
- `DO IFNULL(NULL, NULL)` and `SELECT CAST(IFNULL(NULL, NULL) AS DECIMAL)` caused a server crash. (Bug#12841)
- After changing the character set with `SET CHARACTER SET`, the result of the `GROUP_CONCAT()` function was not converted to the proper character set. (Bug#12829)
- The Windows installer made a change to one of the `mysql.proc` table files, causing stored routine functionality to be compromised. The Windows installer now never overwrites files in the MySQL data directory. During an upgrade from one version to another, a file in the data directory will not be overwritten even if it has not been modified since it was put there by an older installer.

If you have already lost access to stored routines because of this problem, you can get them back using the following procedure:

- Stop the server.
- In the `mysql\data` directory under your MySQL installation directory, and replace the `proc.frm` file with corresponding file from the version of MySQL that you were using before you upgraded.
- Start the server
- Start the `mysql` command-line client (use the `root` account or another account that has full database privileges) and execute the `mysql_fix_privilege_tables.sql` script that upgrades the grant tables to the current structure. Instructions for doing this are given in Section 5.5.4, “`mysql_fix_privilege_tables` — Upgrade MySQL System Tables”.

After this, all stored routine functionality should work. (Bug#12820)

- Queries with subqueries, where the inner subquery uses the `range` or `index_merge` access method, could return incorrect results. (Bug#12720)
- The server failed to disallow `SET AUTOCOMMIT` in stored functions and triggers. It is allowed to change the value of `AUTO-COMMIT` in stored procedures, but a runtime error might occur if the procedure is invoked from a stored function or trigger. (Bug#12712)
- Simultaneous execution of DML statements and `CREATE TRIGGER` or `DROP TRIGGER` statements on the same table could

- cause server crashes or errors. (Bug#12704)
- Performing an `IS NULL` check on the `MIN()` or `MAX()` of an indexed column in a complex query could produce incorrect results. (Bug#12695)
 - Use of `PREPARE` and `EXECUTE` with a statement that selected from a view in a subquery could cause a server crash. (Bug#12651)
 - If the binary log is enabled, execution of a stored procedure that modifies table data and uses user variables could cause a server crash or incorrect information to be written to the binary log. (Bug#12637)
 - The `LIKE ... ESCAPE` syntax produced invalid results when escape character was larger than one byte. (Bug#12611)
 - `mysqldump` did not dump triggers properly. (Bug#12597)
 - `InnoDB`: Limit recursion depth to 200 in deadlock detection to avoid running out of stack space. (Bug#12588)
 - The `mysql.server` script contained incorrect path for the `libexec` directory. (Bug#12550)
 - A `UNION` of long `utf8 VARCHAR` columns was sometimes returned as a column with a `LONGTEXT` data type rather than `VARCHAR`. This could prevent such queries from working at all if selected into a `MEMORY` table because the `MEMORY` storage engine does not support the `TEXT` data types. (Bug#12537)
 - A client connection thread cleanup problem caused the server to crash when closing the connection if the binary log was enabled. (Bug#12517)
 - Use of the `mysql` client `HELP` command from within a stored routine caused a “packets out of order” error and a lost connection. Now `HELP` is detected and disallowed within stored routines. (Bug#12490)
 - The `SYSDATE()` function now returns the time at which it was invoked. In particular, within a stored routine or trigger, `SYS-DATE()` returns the time at which it executes, not the time at which the stored routine or triggering statement began to execute. (Bug#12480)
 - `CREATE VIEW` inside a stored procedure caused a server crash if the table underlying the view had been deleted. (Bug#12468)
 - Deadlock occurred when several account management statements were run (particularly between `FLUSH PRIVILEGES/SET PASSWORD` and `GRANT/REVOKE` statements). (Bug#12423)
 - `InnoDB` was too permissive with `LOCK TABLE ... READ LOCAL` and allowed new inserts into the table. Now `READ LOCAL` is equivalent to `READ` for `InnoDB`. This will cause slightly more locking in `mysqldump`, but makes `InnoDB` table dumps consistent with `MyISAM` table dumps. (Bug#12410)
 - If a stored function invoked from a `SELECT` failed with an error, it could cause the client connection to be dropped. Now such errors generate warnings instead so as not to interrupt the `SELECT`. (Bug#12379)
 - The value of `character_set_results` could be set to `NULL`, but returned the string "NULL" when retrieved. (Bug#12363)
 - On Windows, the server was preventing tables from being created if the table name was a prefix of a forbidden name. For example, `nul` is a forbidden name because it's the same as a Windows device name, but a table with the name of `n` or `nu` was being forbidden as well. (Bug#12325)
 - **Incompatible change:** A lock wait timeout caused `InnoDB` to roll back the entire current transaction. Now it rolls back only the most recent SQL statement. (Bug#12308)
 - `ALTER TABLE ... DISCARD TABLESPACE` for non-`InnoDB` table caused the client to lose the connection. (The server was not returning the error properly.) (Bug#12207)
 - Outer join elimination was erroneously applied for some queries that used a `NOT BETWEEN` condition, an `IN(value_list)` condition, or an `IF()` condition. (Bug#12102, Bug#12101)
 - Foreign keys were not properly enforced in `TEMPORARY` tables. Foreign keys now are disallowed in `TEMPORARY` tables. (Bug#12084)
 - When using a cursor, a `SELECT` statement that uses a `GROUP BY` clause could return incorrect results. (Bug#11904)
 - Replication of `LOAD DATA INFILE` failed between systems using different pathname syntax (such as delimiter characters). (Bug#11815)
 - The `character_set_system` system variable could not be selected with `SELECT @@character_set_system`. (Bug#11775)

- **NDB**: A cluster shutdown following the crash of a data node would fail to terminate the remaining node processes, even though `nldb_mgm` showed the shutdown request as having been completed. (Bug#11623, Bug#9996, Bug#10938)
- A memory leak resulting from repeated `SELECT ... INTO` statements inside a stored procedure could cause the server to crash. (Bug#11333)
- Use of yaSSL for a secure client connection caused `LOAD DATA LOCAL INFILE` to fail. (Bug#11286)
- `mysqld_multi` now quotes arguments on command lines that it constructs to avoid problems with arguments that contain shell metacharacters. (Bug#11280)
- The server allowed privileges to be granted explicitly for the `INFORMATION_SCHEMA` database. Such privileges are always implicit and should not be grantable. (Bug#10734)
- `SHOW CREATE PROCEDURE` and `SHOW CREATE FUNCTION` no longer qualify the routine name with the database name, for consistency with the behavior of `SHOW CREATE TABLE`. (Bug#10362)
- **NDBCluster**: The average row size for Cluster tables was being calculated incorrectly. This affected the values shown for the `Data_length` and `Avg_row_length` columns in the output generated by `SHOW TABLE STATUS` as well as the values for the `data_length` and `data_length/table_rows` columns shown in the `TABLES` table of the `INFORMATION_SCHEMA` database with respect to Cluster tables (tables using other storage engines were not affected by this bug). (Bug#9896)
- The server incorrectly generated an `Unknown table` error message when for attempts to drop tables in the `INFORMATION_SCHEMA` database. Now it issues an `Access denied` message. (Bug#9846)
- Within a stored procedure, fetching a large number of rows in a loop using a cursor could result in a server crash or an out of memory error. Also, values inserted within a stored procedure using a cursor were interpreted as `latin1` even if character set variables had been set to a different character set. (Bug#9819, Bug#6513)
- The server allowed `TEMPORARY` tables and stored procedures to be created in the `INFORMATION_SCHEMA` database. (Bug#9683, Bug#10708)
- `SHOW FIELDS` truncated the `TYPE` column to 40 characters. (Bug#7142)
- A view-creation statement of the form `CREATE VIEW name AS SELECT ... FROM tbl_name AS name` failed with a `Not unique table/alias: 'name'` error. (Bug#6808)
- `myisampack` did not properly pack `BLOB` values larger than 2^{24} bytes. (Bug#4214)
- Stop the server.
- Start the server
- In the `mysql\data` directory under your MySQL installation directory, and replace the `proc.frm` file with corresponding file from the version of MySQL that you were using before you upgraded.
- Start the `mysql` command-line client (use the `root` account or another account that has full database privileges) and execute the `mysql_fix_privilege_tables.sql` script that upgrades the grant tables to the current structure. Instructions for doing this are given in Section 5.5.4, “`mysql_fix_privilege_tables` — Upgrade MySQL System Tables”.

E.1.18. Changes in MySQL 5.0.12 (02 September 2005)

Functionality added or changed:

- A query of the form `SHOW TABLE STATUS FROM db_name WHERE name IN (select_query)` would crash the server. (Bug#12636)
- Using `DESCRIBE` on a view after renaming a column in one of the view's base tables caused the server to crash. (Bug#12533)
- Interleaved execution of stored procedures and functions could be written to the binary log incorrectly, causing replication slaves to get out of sync. (Bug#12335)
- Calls to stored procedures were written to the binary log even within transactions that were rolled back, causing them to be executed on replication slaves. (Bug#12334)
- `SHOW TABLE STATUS FROM INFORMATION_SCHEMA` now sorts output by table name the same as it does for other databases. (Bug#12315)

- It is no longer possible to issue `FLUSH` commands from within stored functions or triggers. See [Section F.1, “Restrictions on Stored Routines and Triggers”](#), for details. (Bug#12280, Bug#12307)
- `SHOW OPEN TABLES` now supports `FROM` and `LIKE` clauses. (Bug#12183)
- Recursive triggers are detected and disallowed. Also, within a stored function or trigger, it is not allowable to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger. (Bug#11896, Bug#12644)
- `INFORMATION_SCHEMA` objects are now reported as a `SYSTEM VIEW` table type. (Bug#11711)
- The stability of cursors when used with `InnoDB` tables was greatly improved. (Bug#11309, Bug#11832, Bug#12243)
- Trying to drop the default keycache by setting `@global.key_buffer_size` to zero now returns a warning that the default keycache cannot be dropped. (Bug#10473)
- `SHOW ENGINE INNODB STATUS` now can display longer query strings. (Bug#7819)
- Added the `SLEEP()` function, which pauses for the number of seconds given by its argument. (Bug#6760)
- **Incompatible change:** Beginning with MySQL 5.0.12, natural joins and joins with `USING`, including outer join variants, are processed according to the SQL:2003 standard. The changes include elimination of redundant output columns for `NATURAL` joins and joins specified with a `USING` clause and proper ordering of output columns. The precedence of the comma operator also now is lower compared to `JOIN`.

These changes make MySQL more compliant with standard SQL. However, they can result in different output columns for some joins. Also, some queries that appeared to work correctly prior to 5.0.12 must be rewritten to comply with the standard. For details about the scope of the changes and examples that show what query rewrites are necessary, see [Section 12.2.7.1, “JOIN Syntax”](#). (Bug#6495, Bug#6136, Bug#10972, Bug#9978, Bug#10428, Bug#10646, Bug#6276, Bug#6489, Bug#6558, Bug#9067, Bug#4789, Bug#12065, Bug#13551)

- `SHOW TABLE STATUS` for a view now shows `VIEW` in uppercase, consistent with `SHOW TABLES` and `INFORMATION_SCHEMA`. (Bug#5501)

Bugs fixed:

- **MySQL Cluster:** When it could not copy a fragment, `ndbd` exited without printing a message about the condition to the error log. Now the message is written. (Bug#12900)
- **MySQL Cluster:** Corrected the parsing of the `CLUSTERLOG` command by `ndb_mgm` to allow multiple items. (Bug#12833)
- **MySQL Cluster:** When a disk full condition occurred, `ndbd` exited without printing a message about the condition to the error log. Now the message is written. (Bug#12716)
- **MySQL Cluster:** Cluster failed to take character set data into account when recomputing hashes (and thus could not locate records for updating or deletion) following a configuration change and node restart. (Bug#12220)
- **MySQL Cluster:** An `ALTER TABLE` command caused loss of data stored prior to the issuing of the command. (Bug#12118)
- **MySQL Cluster:** Bad values in `config.ini` caused `ndb_mdm` to crash. (Bug#12043)
- **MySQL Cluster:** When a schema was detected to be corrupt, `ndb` neglected to close it, resulting in a “file already open” error if the schema was opened again later. (Bug#12027)
- **MySQL Cluster:** Improved error messages related to filesystem issues. (Bug#11218)
- **MySQL Cluster:** Wrong error message displayed when cluster management server closed port while `mysqld` was connecting. (Bug#10950)
- An optimizer estimate of zero rows for a non-empty `InnoDB` table used in a left or right join could cause incomplete rollback for the table. (Bug#12779)
- `mysql_fix_privilege_tables.sql` was missing a comma, causing a syntax error when executed. (Bug#12705)
- Invocations of the `SLEEP()` function incorrectly could get optimized away for statements in which it occurs. Statements containing `SLEEP()` incorrectly could be stored in the query cache. (Bug#12689)
- Improper use of loose index scan in `InnoDB` sometimes caused incorrect query results. (Bug#12672)

- A `SELECT DISTINCT` query with a constant value for one of the columns would return only a single row. (Bug#12625)
- `SHOW TABLES FROM` returned wrong error message if the schema specified did not exist. (Bug#12591)
- A server crash could result from an update of a view defined as a join, even though the update updated only a single table. (Bug#12569)
- `DELETE` or `UPDATE` for an indexed `MyISAM` table could fail. This was due to a change in end-space comparison behavior from 4.0 to 4.1. (Bug#12565)
- Some statements executed on a master server caused the SQL thread on a slave to run out of memory. (Bug#12532)
- The `COLUMN_DEFAULT` column of the `INFORMATION_SCHEMA.COLUMNS` table should be returned as `NULL` if a column has no default value. An empty string was being returned if the column was defined as `NOT NULL`. (Bug#12518)
- The `ROW()` function returned an incorrect result when comparison involved `NULL` values. (Bug#12509)
- `STRCMP()` was not handled correctly in views. (Bug#12489)
- Trigger and stored procedure execution could break replication. (Bug#12482)
- `NOW()`, `CURRENT_TIME` and values generated by timestamp columns are now constant for the duration of a stored function or trigger. This prevents the breaking of statements-based replication. (Bug#12480, Bug#12481)
- Selecting from a view defined as a join over many tables could result in a server crash due to miscalculation of the number of conditions in the `WHERE` clause. (Bug#12470)
- `MEMORY` tables using `B-Tree` index on 64-bit platforms could produce false table is full errors. (Bug#12460)
- The `CREATE_OPTIONS` column of `INFORMATION_SCHEMA.TABLES` showed incorrect options for tables in `INFORMATION_SCHEMA`. (Bug#12397)
- Mishandling of comparison for rows containing `NULL` values against rows produced by an `IN` subquery could cause a server crash. (Bug#12392)
- Query cache is switched off if a thread (connection) has tables locked. This prevents invalid results where the locking thread inserts values between a second thread connecting and selecting from the table. (Bug#12385)
- Selecting from a view after `INSERT` statements for the view's underlying table yielded different results than subsequent selects. (Bug#12382)
- Concatenating `USER()` or `DATEBASE()` with a column produced invalid results. (Bug#12351)
- Comparison of `InnoDB` multi-part primary keys that include `VARCHAR` columns can result in incorrect results. (Bug#12340)
- Renamed the `rest()` macro in `my_list.h` to `list_rest()` to avoid name clashes with user code. (Bug#12327)
- When restoring `INFORMATION_SCHEMA` as the default database after failing to execute a stored procedure in an inaccessible database, the server returned a spurious `ERROR 42000: Unknown database 'information_schema'` message. (Bug#12318)
- Users created using an IP address or other alias rather than a hostname listed in `/etc/hosts` could not set their own passwords. (Bug#12302)
- The `NUMERIC_SCALE` column of the `INFORMATION_SCHEMA.COLUMNS` table should be returned as `0` for integer columns. It was being returned as `NULL`. (Bug#12301)
- Creating a view that included the `TIMESTAMPDIFF()` function resulted in a invalid view. (Bug#12298)
- `CHECKSUM TABLE` command returned incorrect results for tables with deleted rows. After upgrading, users who used stored checksum information to detect table changes should rebuild their checksum data. (Bug#12296)
- Inserting `NULL` into a `GEOMETRY` column for a table that has a trigger could result in a server crash if the table was subsequently dropped. (Bug#12281)
- `myisampack` failed to delete `.TMD` temporary files when run with `-T` option. (Bug#12235)
- A race condition between server threads could cause a crash if one thread deleted a stored routine while another thread was executing a stored routine. (Bug#12228)
- Duplicate instructions in stored procedures resulted in incorrect execution when the optimizer optimized the duplicate code

away. (Bug#12168)

- `XA` allowed two active transactions to be started with the same `XID`. (Bug#12162)
- `NULL` column definitions read incorrectly for inner tables of nested outer joins. (Bug#12154)
- `GROUP_CONCAT` ignores the `DISTINCT` modifier when used in a query joining multiple tables where one of the tables has a single row. (Bug#12095)
- A failure to obtain a lock for an `IN SHARE MODE` query could result in a server crash. (Bug#12082)
- `SELECT ... INTO var_name` within a trigger could cause a server crash. (Bug#11973)
- Using cursors and nested queries for the same table, corrupted results were returned for the outer query. (Bug#11909)
- A query using a `LEFT JOIN`, an `IN` subquery on the outer table, and an `ORDER BY` clause, caused the server to crash when cursors were enabled. (Bug#11901)
- `UNION` query with `FULLTEXT` could cause server crash. (Bug#11869)
- Some subqueries of the form `SELECT ... WHERE ROW(...) IN (subquery)` were being handled incorrectly. (Bug#11867)
- Column names in subqueries must be unique, but were not being checked for uniqueness. (Bug#11864)
- `TRUNCATE TABLE` did not work with `TEMPORARY InnoDB` tables. (Bug#11816)
- On Windows, the server could crash during shutdown if both replication threads and normal client connection threads were active. (Bug #Bug#11796)
- The `mysql_info()` C API function could return incorrect data when executed as part of a multi-statement that included a mix of statements that do and do not return information. (Bug#11688)
- A trigger that included a `SELECT` statement could cause a server crash. (Bug#11587)
- Built-in commands for the `mysql` client, such as `delimiter` and `\d` are now always parsed within files that are read using the `\.` and `source` commands. (Bug#11523)
- Added portability check for Intel compiler to address a problem compiling `InnoDB` code. (Bug#11510)
- `ALTER TABLE db_name.t RENAME t` did not move the table to default database unless the new name was qualified with the database name. (Bug#11493)
- Joins on `VARCHAR` columns of different lengths could produce incorrect results. (Bug#11398)
- For PKG installs on Mac OS X, the preinstallation and postinstallation scripts were being run only for new installations and not for upgrade installations, resulting in an incomplete installation process. (Bug#11380)
- Prepared statement parameters could cause errors in the binary log if the character set was `cp932`. (Bug#11338)
- Columns defined as `TINYINT(1)` were redefined as `TINYINT(4)` when incorporated into a `VIEW`. (Bug#11335)
- Stored procedures with particularly long loops could crash server due to memory leak. (Bug#11247, Bug#12297)
- `SET GLOBAL TRANSACTION ISOLATION LEVEL` was not working. (Bug#11207)
- A view was allowed to depend on a function that referred to a temporary table. (Bug#10970)
- Issuing `FLUSH INSTANCES` followed by `STOP INSTANCE` caused instance manager to crash. (Bug#10957)
- User variables were not automatically cast for comparisons, causing queries to fail if the column and connection character sets differed. Now when mixing strings with different character sets but the same coercibility, allow conversion if one character set is a superset of the other. (Bug#10892)
- An incorrect conversion from `double` to `ulonglong` caused indexes not to be used for `BDB` tables on HP-UX. (Bug#10802)
- Slave I/O threads were considered to be in the running state when launched (rather than after successfully connecting to the master server), resulting in incorrect `SHOW SLAVE STATUS` output. (Bug#10780)
- `DATE_ADD()` and `DATE_SUB()` were converting invalid dates to `NULL` in `TRADITIONAL SQL` mode rather than rejecting them with an error. (Bug#10627)

- Views with multiple `UNION` and `UNION ALL` produced incorrect results. ([Bug#10624](#))
- It was not possible to create a stored function with a spatial return value data type. ([Bug#10499](#))
- `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` could fail with an erroneous “Column '`col_name`' specified twice” error. ([Bug#10109](#))
- The only valid values for the `PACK_KEYS` table option are 0 and 1, but other values were being accepted. ([Bug#10056](#))
- Using a stored procedure that referenced tables in the `INFORMATION_SCHEMA` database would return an empty result set. ([Bug#10055](#), [Bug#12278](#))
- `FLUSH TABLES WITH READ LOCK` combined with `LOCK TABLE ... WRITE` caused deadlock. ([Bug#9459](#))
- A data type of `CHAR BINARY` was not recognized as valid for stored routine parameters. ([Bug#9048](#))
- `ISO-8601` formatted dates were not being parsed correctly. ([Bug#7308](#))
- On Windows when the `--innodb_buffer_pool_awesome_mem_mb` option has been given, the server detects whether AWE support is available and has been compiled into the server, and displays an appropriate error message if not. ([Bug#6581](#))
- A “Duplicate column name” error no longer occurs when selecting from a view defined as `SELECT *` from a join that uses a `USING` clause on tables that have a common column name. ([Bug#6558](#))
- Pathname values for options such as `---basedir` or `--datadir` didn't work on Japanese Windows machines for directory names containing multi-byte characters having a second byte of `0x5C` (“`\`”). ([Bug#5439](#))
- If a `DROP DATABASE` fails on a master server due to the presence of a non-database file in the database directory, the master have the database tables deleted, but not the slaves. To deal with failed database drops, we now write `DROP TABLE` statements to the binary log for the tables so that they are dropped on slaves. ([Bug#4680](#))
- `SHOW TABLE STATUS` sometimes reported a `Row_format` value of `Dynamic` for `MEMORY` tables, though such tables always have a format of `Fixed`. ([Bug#3094](#))

E.1.19. Changes in MySQL 5.0.11 (06 August 2005)

Functionality added or changed:

- `NDB`: Improved handling of the configuration variables `NoOfPagesToDiskDuringRestartACC`, `NoOfPagesToDiskAfterRestartACC`, `NoOfPagesToDiskDuringRestartTUP`, and `NoOfPagesToDiskAfterRestartTUP` should result in noticeably faster startup times for MySQL Cluster. ([Bug#12149](#))
- Added an optimization that avoids key access with `NULL` keys for the `ref` method when used in outer joins. ([Bug#12144](#))
- Added support of where clause for queries with `FROM DUAL`. ([Bug#11745](#))
- Maximum size of stored procedures increased from 64k to 4Gb. ([Bug#11602](#))
- `SHOW CHARACTER SET` and `INFORMATION_SCHEMA` now properly report the `Latin1` character set as `cp1252`. ([Bug#11216](#))
- Added new `ER_STACK_OVERRUN_NEED_MORE` error message to indicate that, while the stack is not completely full, more stack space is required. ([Bug#11213](#))
- `mysqldump` now dumps triggers for each dumped table. This can be suppressed with the `--skip-triggers` option. ([Bug#10431](#))
- Added error message for users who attempt `CREATE TABLE ... LIKE` and specify a non-table in the `LIKE` clause. ([Bug#6859](#))
- Security improvement: Applied a patch that addresses a potential `zlib` data vulnerability that could result in an application crash. This only affects the binaries for platforms that are linked statically against the bundled `zlib` (most notably Microsoft Windows and HP-UX). ([CVE-2005-1849](#))

Bugs fixed:

- Creation of the `mysql` group account failed during the RPM installation. ([Bug#12348](#))

- Updated dependency list for RPM builds to include missing dependencies such as `useradd` and `groupadd`. (Bug#12233)
- A delayed insert that would duplicate an existing record crashed the server instead. (Bug#12226)
- When `DROP DATABASE` was called concurrently with a `DROP TABLE` of any table, the MySQL Server crashed. (Bug#12212)
- InnoDB: True `VARCHAR`: Return `NULL` columns in the format expected by MySQL. (Bug#12186)
- Information about a trigger was not displayed in the output of `SELECT ... FROM INFORMATION_SCHEMA.TRIGGERS` when the selected database was `INFORMATION_SCHEMA`, prior to the trigger's first invocation. (Bug#12127)
- InnoDB: Do not flush after each write, not even before setting up the doublewrite buffer. Flushing can be extremely slow on some systems. (Bug#12125)
- Two threads could potentially initialize different characters sets and overwrite each other. (Bug#12109)
- `big5` strings were not being stored in `FULLTEXT` index. (Bug#12075)
- Character data truncated when GBK characters `0xA3A0` and `0xA1` are present. (Bug#11987)
- `ALTER TABLE` when `SQL_MODE = 'TRADITIONAL'` gave rise to an invalid error message. (Bug#11964)
- Issuing successive `FLUSH TABLES WITH READ LOCK` would cause the `mysql` client to hang. (Bug#11934)
- `mysql_install_db` used static `localhost` value in `GRANT` tables even when server hostname is not `localhost`, such as `localhost.localdomain`. This change is applied to version 5.0.10b on Windows. (Bug#11822)
- Comparisons like `SELECT "A\\" LIKE "A\\" ;` fail when using `SET NAMES utf8 ;`. (Bug#11754)
- Attempting to repair a table having a fulltext index on a column containing words whose length exceeded 21 characters and where `myisam_repair_threads` was greater than 1 would crash the server. (Bug#11684)
- The MySQL Cluster backup log was invalid where the number of Cluster nodes was not equal to a power of 2. (Bug#11675)
- When used in a `SELECT` query against a view, the `GROUP_CONCAT()` function returned only a single row. (Bug#11412)
- Multiplying `ABS()` output by a negative number would return incorrect results. (Bug#11402)
- The `LPAD()` and `RPAD()` functions returned the wrong length to `mysql_fetch_fields()`. (Bug#11311)
- A `UNIQUE VARCHAR` column would be mis-identified as `MUL` in table descriptions. (Bug#11227)
- DDL statements now are allowed in stored procedures if the procedure is not invoked from a stored function or a trigger. Also fixed problems where a `TEMPORARY` statement created by one stored routine was inaccessible to another routine invoked during the same connection. (Bug#11126)
- Calling the C API function `mysql_stmt_fetch()` after all rows of a result set were exhausted would return an error instead of `MYSQL_NO_DATA`. (Bug#11037)
- `SELECT @@local...` returned `@@session...` in the column header. (Bug#10724)
- Incorrect error message displayed if user attempted to create a table in a non-existing database using `CREATE database_name.table_name` syntax. (Bug#10407)
- Unsigned `LONG` system variables may return incorrect value when retrieved with a `SELECT` for certain values. (Bug#10351)
- `GROUP_CONCAT()` sometimes returned a result with a different collation from that of its arguments. (Bug#10201)
- Prepared statements were not being written to the Slow Query log. (Bug#9968)
- `max_connections_per_hour` setting was being capped by unrelated `max_user_connections` setting. (Bug#9947)
- In stored procedures, a cursor that fetched an empty string into a variable would set the variable to `NULL` instead. (Bug#8692)
- Added checks to prevent error when allocating memory when there was insufficient memory available. (Bug#7003)
- Multiple `SELECT SQL_CACHE` queries in a stored procedure causes error and client hang. (Bug#6897)
- A trigger dependent on a feature of one `SQL_MODE` setting would cause an error when invoked after the `SQL_MODE` was changed. (Bug#5891)

E.1.20. Changes in MySQL 5.0.10 (27 July 2005)

Functionality added or changed:

- The output of `percona --help` now displays the `--ndb` option. (Bug#11999)
- Security improvement: Applied a patch that addresses a `zlib` data vulnerability that could result in a buffer overflow and code execution. (Bug#11844, CVE-2005-2096)
- On Windows, the search path used by MySQL applications for `my.ini` now includes `..\my.ini` (that is, the application's parent directory, and hence, the installation directory). (Bug#10419)
- The `INFORMATION_SCHEMA` database now includes a `TRIGGERS` table. See Section 21.16, “The `INFORMATION_SCHEMA TRIGGERS` Table”, for details. (Bug#9586)
- The viewing of triggers and trigger metadata has been enhanced as follows:
 - An extension to the `SHOW` command has been added: `SHOW TRIGGERS` can be used to view a listing of triggers. See Section 12.5.4.26, “`SHOW TRIGGERS Syntax`”, for details.
 - The `INFORMATION_SCHEMA` database now includes a `TRIGGERS` table. See Section 21.16, “The `INFORMATION_SCHEMA TRIGGERS` Table”, for details.

(Bug#9586)

- It is no longer necessary to issue an explicit `LOCK TABLES` for any tables accessed by a trigger prior to executing any statements that might invoke the trigger. (Bug#8406, Bug#9581)
- **Incompatible change:** The namespace for triggers has changed. Previously, trigger names had to be unique per table. Now they must be unique within the schema (database). An implication of this change is that `DROP TRIGGER` syntax now uses a schema name instead of a table name (schema name is optional and, if omitted, the current schema will be used).

Note

When upgrading from a previous version of MySQL 5 to MySQL 5.0.10 or newer, you must drop all triggers and re-create them or `DROP TRIGGER` will not work after the upgrade. A suggested procedure for doing this is given in Section 2.4.17.2, “Upgrading from MySQL 4.1 to 5.0”.

(Bug#5892)

- Added `mysql_get_character_set_info()` C API function for obtaining information about the default character set of the current connection.
- An extension to the `SHOW` command has been added: `SHOW TRIGGERS` can be used to view a listing of triggers. See Section 12.5.4.26, “`SHOW TRIGGERS Syntax`”, for details.
- Add the `--defaults-group-suffix` option. See Section 4.3.2, “Using Option Files”.
- **MySQL Cluster:** A new `-P` option is available for use with the `ndb_mgmd` client. When called with this option, `ndb_mgmd` prints all configuration data to `stdout`, then exits.
- The bundled version of the `readline` library was upgraded to version 5.0.
- Triggers can now reference tables by name. See Section 19.1, “`CREATE TRIGGER Syntax`”, for more information.
- Add `table_lock_wait_timeout` global server system variable.

Bugs fixed:

- The temporary tables created by an `ALTER TABLE` on a cluster table were visible to all MySQL servers. (Bug#12055)
- Fixed compile error when using GCC4 on AMD64. (Bug#12040)
- `NDB` ignored the `Hostname` option in the `NDBD DEFAULT` section of the Cluster configuration file. (Bug#12028)
- `SHOW BINARY LOGS` displayed a file size of 0 for all log files but the current one if the files were not located in the data directory. (Bug#12004)
- `NDB`: Attempting to create or drop tables during a backup would cause the cluster to shut down. (Bug#11942)

- `NDB_MGMD` was leaking file descriptors. (Bug#11898)
- Increased the version number of the `libmysqlclient` shared library from 14 to 15 because it is binary incompatible with the MySQL 4.1 client library. (Bug#11893)
- The server crashed when dropping a trigger that invoked a stored procedure, if the procedure was not yet in the connection-specific stored routine cache. (Bug#11889)
- `SELECT ... NOT IN()` gave unexpected results when only static value present between the `()`. (Bug#11885)
- A recent optimizer change caused `DELETE ... WHERE ... NOT LIKE` and `DELETE ... WHERE ... NOT BETWEEN` to not properly identify the rows to be deleted. (Bug#11853)
- Execution of a prepared statement that invoked a non-existent or dropped stored routine would crash the server. (Bug#11834)
- Selecting the result of an aggregate function for an `ENUM` or `SET` column within a subquery could result in a server crash. (Bug#11821)
- Creating a table with a `SET` or `ENUM` column with the `DEFAULT 0` clause caused a server crash if the table's character set was `utf8`. (Bug#11819)
- Incorrect column values could be retrieved from views defined using statements of the form `SELECT * FROM tbl_name .` (Bug#11771)
- When invoked within a view, `SUBTIME()` returned incorrect values. (Bug#11760)
- For several character sets, MySQL incorrectly converted the character code for the division sign to the `euc_jpms` character set. (Bug#11717)
- Performing an `ORDER BY` on a `SELECT` from a `VIEW` produced unexpected results when `VIEW` and underlying table had the same column name on different columns. (Bug#11709)
- Execution of `SHOW TABLES` failed to increment the `Com_show_tables` status variable. (Bug#11685)
- `LIKE` pattern matching using prefix index didn't return correct result. (Bug#11650)
- Invoking the `DES_ENCRYPT()` function could cause a server crash if the server was started without the `--des-key-file` option. (Bug#11643)
- IP addresses not shown in `ndb_mgm SHOW` command on second `ndb_mgmd` (or on `ndb_mgmd` restart). (Bug#11596)
- `SHOW PROCEDURE/FUNCTION STATUS` didn't work for users with limited access. (Bug#11577)
- `mysqlbinlog` was failing the test suite on Windows due to `BOOL` being incorrectly cast to `INT`. (Bug#11567)
- The server crashed upon execution of a statement that used a stored function indirectly (via a view) if the function was not yet in the connection-specific stored routine cache and the statement would update a `Handler_xxx` status variable. This fix allows the use of stored routines under `LOCK TABLES` without explicitly locking the `mysql.lock` table. However, you cannot use `mysql.proc` in statements that will combine locking of it with modifications for other tables. (Bug#11554)
- `NDBCluster`: Server left core files following shutdown if data nodes had failed. (Bug#11516)
- Aliasing the column names in a `VIEW` did not work when executing a `SELECT` query on the `VIEW`. (Bug#11399)
- The `mysql.proc` table was not being created properly with the proper `utf8` character set and collation, causing server crashes for stored procedure operations if the server was using a multi-byte character set. To take advantage of the bug fix, `mysql_fix_privilege_tables` should be run to correct the structure of the `mysql.proc` table.

Note that it is *necessary* to run `mysql_fix_privileges_tables` when upgrading from a previous installation that contains the `mysql.proc` table (that is, from a previous 5.0 installation). Otherwise, creating stored procedures might not work. (Bug#11365)
- When attempting to drop a table with a broken unique index, `NDB` failed to drop the table and erroneously report that the table was unknown. (Bug#11355)
- For prepared statements, the SQL parser did not disallow “?” parameter markers immediately adjacent to other tokens, which could result in malformed statements in the binary log. (For example, `SELECT * FROM t WHERE? = 1` could become `SELECT * FROM t WHERE0 = 1`.) (Bug#11299)
- The C API function `mysql_statement_reset()` did not clear error information. (Bug#11183)

- `INFORMATION_SCHEMA.COLUMNS` had some inaccurate values for some data types. (Bug#11057)
- MySQL server would crash if a fetch was performed after a `ROLLBACK` when cursors were involved. (Bug#10760)
- When two threads compete for the same table, a deadlock could occur if one thread has also a lock on another table through `LOCK TABLES` and the thread is attempting to remove the table in some manner and the other thread wants locks on both tables. (Bug#10600)
- When used within a subquery, `SUBSTRING()` returned an empty string. (Bug#10269)
- `NDB`: Trying to use a greater number of tables than specified by the value of `MaxNoOfTables` caused table corruption such that data nodes could not be restarted. (Bug#9994)
- Multiple-table `UPDATE` queries using `CONVERT_TZ()` would fail with an error. (Bug#9979)
- With strict SQL mode enabled, `ALTER TABLE` reported spurious “Invalid default value” messages for columns that had no `DEFAULT` clause. (Bug#9881)
- `mysql_fetch_fields()` returned incorrect length information for `MEDIUM` and `LONG TEXT` and `BLOB` columns. (Bug#9735)
- Within a stored procedure, selecting from a table through a view caused subsequent updates to the table to fail with a message that the table was read-locked. (Bug#9597)
- Within a stored procedure that selects from a table, invoking another procedure that requires a write lock for the table caused that procedure to fail with a message that the table was read-locked. (Bug#9565)
- Server-side prepared statements failed for columns with a character set of `ucs2`. (Bug#9442)
- In SQL prepared statements, comparisons could fail for values not equally space-padded. For example, `SELECT 'a' = 'a '`; returns 1, but `PREPARE s FROM 'SELECT ?=?'; SET @a = 'a', @b = 'a '; PREPARE s FROM 'SELECT ?=?'; EXECUTE s USING @a, @b;` incorrectly returned 0. (Bug#9379)
- References to system variables in an SQL statement prepared with `PREPARE` were evaluated during `EXECUTE` to their values at prepare time, not to their values at execution time. (Bug#9359)
- Server did not accept some fully-qualified trigger names. (Bug#8758)
- Creating a trigger in one database that references a table in another database was being allowed without generating errors. (Bug#8751)
- Executing a statement that invoked a trigger would cause problems unless a `LOCK TABLES` was first issued for any tables accessed by the trigger. The exact nature of the problem depended upon the MySQL 5.0 release being used: prior to 5.0.3, this resulted in a crash; from 5.0.3 to 5.0.7, MySQL would issue a warning; in 5.0.9, the server would issue an error.
The same issue caused `LOCK TABLES` to fail following `UNLOCK TABLES` if triggers were involved. (Bug#8406, Bug#9581)
- For server shutdown on Windows, error messages of the form `Forcing close of thread n user: 'name'` were being written to the error log. Now connections are closed more gracefully without generating error messages. (Bug#7403)
- For a stored procedure defined with `SQL SECURITY DEFINER` characteristic, `CURRENT_USER()` incorrectly reported the user invoking the procedure, not the user who defined it. (Bug#7291)
- The MySQL server had issues with certain combinations of `basedir` and `datadir`. (Bug#7249)
- Labels in stored routines did not work if the character set was not `latin1`. (Bug#7088)
- Duplicate trigger names were allowed within a single schema. (Bug#6182)
- For execution of a stored procedure that refers to a view, changes to the view definition were not seen. The procedure continued to see the old contents of the view. (Bug#6120)
- The `traditional` SQL mode accepted invalid dates if the date value provided was the result of an implicit type conversion. (Bug#5906)
- In a shared Windows environment, MySQL could not find its configuration file unless the file was in the `C:\` directory. (Bug#5354)
- Functions that evaluate to constants (such as `NOW()` and `CURRENT_USER()`) were being evaluated in the definition of a `VIEW` rather than included verbatim. (Bug#4663)

E.1.21. Changes in MySQL 5.0.9 (15 July 2005)

Functionality added or changed:

- The handling of `BIT` columns has been improved, and should now be much more reliable in a number of cases. ([Bug#11572](#), [Bug#11091](#), [Bug#10617](#))
- Recursion in stored routines is now disabled because it was crashing the server. We plan to modify stored routines to allow this to operate safely in a future release. ([Bug#11394](#))
- An attempt to create a `TIMESTAMP` column with a display width (for example, `TIMESTAMP(6)`) now results in a warning. Display widths have not been supported for `TIMESTAMP` since MySQL 4.1. ([Bug#10466](#))
- `mysql_real_escape_string()` API function now respects `NO_BACKSLASH_ESCAPES` SQL mode. ([Bug#10214](#))
- `InnoDB`: Make `CHECK TABLE` killable. ([Bug#9730](#))
- `InnoDB`: Make `innodb_thread_concurrency=20` by default. Bypass the concurrency checking if the setting is greater than or equal to 20.
- `InnoDB`: Various optimizations. Removed unreachable debug code from non-debug builds. Added hints for the branch predictor in `gcc`. Made assertions occupy less space.
- `InnoDB`: When creating or extending an `InnoDB` data file, at most one megabyte at a time is allocated for initializing the file. Previously, `InnoDB` allocated and initialized 1 or 8 megabytes of memory, even if only a few 16-kilobyte pages were to be written. This improves the performance of `CREATE TABLE` in `innodb_file_per_table` mode.

Bugs fixed:

- NDB Cluster: When trying to open a table that could not be discovered or unpacked, cluster would return error codes which the MySQL server falsely interpreted as operating system errors. ([Bug#103651](#))
- The `--master-data` option for `mysqldump` resulted in no error if the binary log was not enabled. Now an error occurs unless the `--force` option is given. ([Bug#11678](#))
- When a table had a primary key containing a `BLOB` column, creation of another index failed with the error `BLOB/TEXT column used in key specification without keylength`, even when the new index did not contain a `BLOB` column. ([Bug#11657](#))
- Incorrect results when using `GROUP BY ... WITH ROLLUP` on a `VIEW`. ([Bug#11639](#))
- MySQL would not compile correctly on QNX due to missing `rint()` function. ([Bug#11544](#))
- A `SELECT DISTINCT col_name` would work correctly with a `MyISAM` table only when there was an index on `col_name`. ([Bug#11484](#))
- Using `CONCAT_WS` on a column set `NOT NULL` caused incorrect results when used in a `LEFT JOIN`. ([Bug#11469](#))
- Temporary tables were created in the data directory instead of `tmpdir`. ([Bug#11440](#))
- Running a `CHECK TABLES` on multiple views crashed the server. ([Bug#11337](#))
- Manually inserting a row with `host= ''` into `mysql.tables_priv` and performing a `FLUSH PRIVILEGES` would cause the server to crash. ([Bug#11330](#))
- Wrong comparison method used in `VIEW` when relaxed date syntax used (for example, `2005.06.10`). ([Bug#11325](#))
- Signed `BIGINT` would not accept `-9223372036854775808` as a `DEFAULT` value. ([Bug#11215](#))
- Optimizer performed range check when comparing unsigned integers to negative constants, could cause errors. ([Bug#11185](#))
- A cursor using a query with a filter on a `DATE` or `DATETIME` column would cause the server to crash server after the data was fetched. ([Bug#11172](#))
- The `mysql_config` script did not handle symbolic linking properly. ([Bug#10986](#))
- `mysqldump` failed when reloading a view if the view was defined in terms of a different view that had not yet been reloaded. `mysqldump` now creates a dummy table to handle this case. ([Bug#10927](#))

- If a prepared statement cursor is opened but not completely fetched, attempting to open a cursor for a second prepared statement will fail. (Bug#10794)
- Combining cursors and subqueries could cause server crash or memory leaks. (Bug#10736)
- Instances of the `VAR_SAMP()` function in view definitions were converted to `VARIANCE()`. This is incorrect because `VARIANCE()` is the same as `VAR_POP()`, not `VAR_SAMP()`. (Bug#10651)
- `DES_ENCRYPT()` and `DES_DECRYPT()` require SSL support to be enabled, but were not checking for it. Checking for incorrect arguments or resource exhaustion was also improved for these functions. (Bug#10589)
- For `MEMORY` tables, it was possible for updates to be performed using outdated key statistics when the updates involved only very small changes in a very few rows. This resulted in the random failures of queries such as `UPDATE t SET col = col + 1 WHERE col_key = 2;` where the same query with no `WHERE` clause would succeed. (Bug#10178)
- When used in joins, `SUBSTRING()` failed to truncate to zero any string values that could not be converted to numbers. (Bug#10124)
- Views did not use indexes on all appropriate queries. (Bug#10031)
- Closing a cursor that was already closed would cause MySQL to hang. (Bug#9814)
- The server would lose table-level `CREATE VIEW` and `SHOW VIEW` privileges following a `FLUSH PRIVILEGES` or server restart. (Bug#9795)
- `mysqldump --xml` did not format `NULL` column values correctly. (Bug#9657)
- The `--no-data` option for `mysqldump` was being ignored if table names were given after the database name. (Bug#9558)
- Clients would hang following some errors with stored procedures. (Bug#9503)
- `mysqldump` could crash for illegal or non-existent table names. (Bug#9358)
- There was a compression algorithm issue with `mysampack` for very large datasets (where the total size of all records in a single column was on the order of 3 GB or more) on 64-bit platforms. (A fix for other platforms was made in MySQL 5.0.6.) (Bug#8321)
- The `ENCRYPT()` and `SUBSTRING_INDEX()` functions would cause errors when used with a `VIEW`. (Bug#7024)
- `SHOW CREATE VIEW` did not take the `ANSI MODE` into account when quoting identifiers. (Bug#6903)
- In strict mode, an `INSERT` into a view that did not include a value for a `NOT NULL` column but that did include a `WHERE` test on the same column would succeed. This happened even though the `INSERT` should have been prevented due to the failure to supply a value for the `NOT NULL` column. (Bug#6443)

E.1.22. Changes in MySQL 5.0.8 (Not released)

Note

Starting with version 5.0.8, changes for MySQL Cluster can be found in the combined Change History.

Functionality added or changed:

- **Warning: Incompatible change:** Previously, conversion of `DATETIME` values to numeric form by adding zero produced a result in `YYYYMMDDHHMMSS` format. The result of `DATETIME+0` is now in `YYYYMMDDHHMMSS.000000` format. (Bug#12268)
- Where a `GROUP BY` query uses a grouping column from the query's `SELECT` clause, MySQL now issues a warning. This is done because the SQL standard states that any grouping column must unambiguously reference a column of the table resulting from the query's `FROM` clause, and allowing columns from the `SELECT` clause to be used as grouping columns is a MySQL extension to the standard.

By way of example, consider the following table:

```
CREATE TABLE users (
  userid INT NOT NULL PRIMARY KEY,
  username VARCHAR(25),
  usergroupid INT NOT NULL
);
```

MySQL allows you to use the alias in this query:

```
SELECT usergroupid AS id, COUNT(userid) AS number_of_users
FROM users
GROUP BY id;
```

However, the SQL standard requires that the column name be used, as shown here:

```
SELECT usergroupid AS id, COUNT(userid) AS number_of_users
FROM users
GROUP BY usergroupid;
```

Queries such as the first of the two shown above will continue to be supported in MySQL; however, beginning with MySQL 5.0.8, using a column alias in this fashion will generate a warning. Note that in the event of a collision between column names and/or aliases used in joins, MySQL attempts to resolve the conflict by giving preference to columns arising from tables named in the query's `FROM` clause. ([Bug#11211](#))

- Added support for `B'10'` syntax for bit literal. ([Bug#10650](#))
- `MEMORY` tables now support indexes of up to 500 bytes. See [Section 13.4, “The MEMORY \(HEAP\) Storage Engine”](#). ([Bug#10566](#))
- The granting or revocation of privileges on a stored routine is no longer performed when running the server with `--skip-grant-tables` even after the statement `SET @@global.automatic_sp_privileges=1;` has been executed. ([Bug#9993](#))
- Expanded on information provided in general log and slow query log for prepared statements. ([Bug#8367](#), [Bug#9334](#))
- The statements `CREATE TABLE`, `TRUNCATE TABLE`, `DROP DATABASE`, and `CREATE DATABASE` cause an implicit commit. ([Bug#6883](#))
- New `SQL_MODE - NO_ENGINE_SUBSTITUTION` Prevents automatic substitution of storage engine when the requested storage engine is disabled or not compiled in. ([Bug#6877](#))

Bugs fixed:

- **Security Fix:** On Windows systems, a user with any of the following privileges
 - `REFERENCES`
 - `CREATE TEMPORARY TABLES`
 - `GRANT OPTION`
 - `CREATE`
 - `SELECT`

on `*.*` could crash `mysqld` by issuing a `USE LPT1;` or `USE PRN;` command. In addition, any of the commands `USE NUL;`, `USE CON;`, `USE COM1;`, or `USE AUX;` would report success even though the database was not in fact changed.

Note

Although this bug was thought to be fixed previously, it was later discovered to be present in the MySQL 5.0.7-beta release for Windows.

([Bug#9148](#))

- Multiple range accesses in a subquery cause server crash. ([Bug#11487](#))
- A `CAST()` value could not be included in a `VIEW`. ([Bug#11387](#))
- Server crashed when using `GROUP BY` on the result of a `DIV` operation on a `DATETIME` value. ([Bug#11385](#))
- `INSERT INTO SELECT FROM view` produced incorrect result when using `ORDER BY`. ([Bug#11298](#))
- Possible `NULL` values in `BLOB` columns could crash the server when a `BLOB` was used in a `GROUP BY` query. ([Bug#11295](#))
- MySQL Cluster: Setting `TransactionInactiveTimeout= 0` did not result in an infinite timeout. ([Bug#11290](#))

- An outer join with an `ON` condition that evaluated to false could return an incorrect result. (Bug#11285)
- An outer join with an empty derived table (a result from a subquery) returned no result. (Bug#11284)
- `CAST(... AS DECIMAL)` didn't work for strings. (Bug#11283)
- Corrected a problem with `IFNULL()` returning an incorrect result on 64-bit systems. (Bug#11235)
- MySQL Cluster: `mysqld` processes would not reconnect to cluster following restart of `ndb_mgmd`. (Bug#11221)
- The `SHOW INSTANCE OPTIONS` command in MySQL Instance Manager displayed option values incorrectly for options for which no value had been given. (Bug#11200)
- The default hostname for MySQL server was always `mysql`. (Bug#11174)
- Fixed server crash due to some internal functions not taking into account that for multi-byte character sets, `CHAR` columns could exceed 255 bytes and `VARCHAR` columns could exceed 65,535 bytes. (Bug#11167)
- MySQL Cluster: Insert records were incorrectly applied by `ndb_restore`, thus making restoration from backup inconsistent if the binlog contained inserts. (Bug#11166)
- Fixed locking problems for multiple-statement `DELETE` statements performed within a stored routine, such as incorrectly locking a to-be-modified table with a read lock rather than a write lock. (Bug#11158)
- Fixed a portability problem testing for `crypt()` support that caused compilation problems when using OpenSSL/yaSSL on HP-UX and Mac OS X. (Bug#11150, Bug#10675)
- `NULLIF()` function could produce incorrect results if first argument is `NULL`. (Bug#11142)
- MySQL Cluster: A delete performed as part of a transaction caused an erroneous result. (Bug#11133)
- MySQL Cluster: Connections between data nodes and management nodes were not being closed following shutdown of `ndb_mgmd`. (Bug#11132)
- `mysqld_safe` would sometimes fail to remove the pid file for the old `mysql` process after a crash. As a result, the server would fail to start due to a false `A mysqld process already exists...` error. (Bug#11122)
- Fixed 64 bit compiler warning for packet length in replication. (Bug#11064)
- Calling a stored procedure that made use of an `INSERT ... SELECT ... UNION SELECT ...` query caused a server crash. (Bug#11060)
- `sql_data_access` column of `routines` table of `INFORMATION_SCHEMA` was empty. (Bug#11055)
- MySQL Cluster: `ndb_mgm` client `show` command displayed incorrect output after master data node failure. (Bug#11050)
- `SELECT DISTINCT` queries or `GROUP BY` queries without `MIN()` or `MAX()` could return inconsistent results for indexed columns. (Bug#11044)
- A `CREATE TABLE db_name.tbl_name LIKE ...` statement would crash the server when no database was selected. (Bug#11028)
- Using `PREPARE` to prepare a statement that invoked a stored routine that deallocated the prepared statement caused a server crash. This is prevented by disabling dynamic SQL within stored routines. (Note: This restriction was lifted in 5.0.13 for stored procedures, but not stored functions or triggers.) (Bug#10975)
- On Windows, `mysqlshow` did not interpret wildcard characters properly if they were given in the table name argument. (Bug#10947)
- The hostname cache was not working. (Bug#10931)
- MySQL Cluster: When using dynamically allocated ports on Linux, cluster would hang on initial startup. (Bug#10893)
- A three byte buffer overflow in the client functions caused improper exiting of the client when reading a command from the user. (Bug#10841)
- The `mysql` client would output a prompt twice following input of very long strings, because it incorrectly assumed that a call to the `_cgets()` function would clear the input buffer. (Bug#10840)
- Setting `@@SQL_MODE = NULL` caused an erroneous error message. (Bug#10732)
- When using a cursor with a prepared statement, the first execution returned the correct result but was not cleaned up properly,

causing subsequent executions to return incorrect results. ([Bug#10729](#))

- Using prepared statements within a stored routine (`PREPARE`, `EXECUTE`, `DEALLOCATE`) could cause the client connection to be dropped after the routine returned. This is prevented by disabling dynamic SQL within stored routines. (Note: This restriction was lifted in 5.0.13 for stored procedures, but not stored functions or triggers.) ([Bug#10605](#))
- Converting a `VARCHAR` column having an index to a different type (such as `TINYTEXT`) gave rise to an incorrect error message.

Note that this bugfix induces a slight change in the behavior of indexes: If an index is defined to be the same length as a field (or is left to default to that field's length), and the length of the field is later changed, then the index will adopt the new length of the field. Previously, the size of the index did not change for some field types (such as `VARCHAR`) when the field type was changed. ([Bug#10543](#))

- `InnoDB`: Pad UTF-8 `VARCHAR` columns with `0x20`. Pad UCS2 `CHAR` columns with `0x0020`. ([Bug#10511](#))
- `InnoDB`: Enforce maximum `CHAR_LENGTH()` of UTF-8 data in `ON UPDATE CASCADE`. ([Bug#10409](#))
- MySQL Cluster: Not allowing sufficient parallelism in cluster configuration (for example, `NoOfTransactions` too small) caused `ndb_restore` to fail without providing any error messages. ([Bug#10294](#))
- `SELECT * FROM table` returned incorrect results when called from a stored procedure, where `table` had a primary key. ([Bug#10136](#))
- MySQL Cluster: Calling `ndb_select_count()` crashed the cluster when running on Red Hat Enterprise 4/64-bit/Opteron. ([Bug#10058](#))
- Fixed a problem where a stored procedure caused a server crash if the query cache was enabled. ([Bug#9715](#))
- Fixed a problem resolving table names with `lower_case_table_names=2` when the table name lettercase differed in the `FROM` and `WHERE` clauses. ([Bug#9500](#))
- `SHOW CREATE DATABASE INFORMATION_SCHEMA` returned an “unknown database” error. ([Bug#9434](#))
- MySQL Cluster: Fixed problem whereby data nodes would fail to restart on 64-bit Solaris ([Bug#9025](#))
- MySQL Cluster: Cluster would time out and crash after first query on 64-bit Solaris 9. ([Bug#8918](#))
- `SELECT DISTINCT ... GROUP BY constant` returned multiple rows (it should return a single row). ([Bug#8614](#))
- An issue with index merging could cause suboptimal index merge plans to be chosen when searching by indexes created on `DATE` columns. The same issue caused the `InnoDB` storage engine to issue the warning `using a partial-field key prefix in search`. ([Bug#8441](#))
- The `mysqlhotcopy` script was not parsing the output of `SHOW SLAVE STATUS` correctly when called with the `-record_log_pos` option. ([Bug#7967](#))
- Fixed hang/crash with Boolean full-text search where a query contained more query terms than one-third of the query length (it could be achieved with truncation operator: `'a*b*c*d*'`). ([Bug#7858](#))
- When used in defining a view, the `TIME_FORMAT()` function failed with calculated values, for example, when passed the value returned by `SEC_TO_TIME()`. ([Bug#7521](#))
- Fixed column name generation in `VIEW` creation to ensure there are no duplicate column names. ([Bug#7448](#))
- An `ORDER BY` clause sometimes had no effect on the ordering of a result when selecting specific columns (as opposed to using `SELECT *`) from a view. ([Bug#7422](#))
- Using `PREPARE` to prepare a statement that invoked a stored routine that executed the prepared statement caused a `Packets out of order` error the second time the routine was invoked. This is prevented by disabling dynamic SQL within stored routines. (Note: This restriction was lifted in 5.0.13 for stored procedures, but not stored functions or triggers.) ([Bug#7115](#))
- Selecting from a view defined using `SELECT SUM(DISTINCT ...)` caused an error; attempting to execute a `SELECT * FROM INFORMATION_SCHEMA.TABLES` query after defining such a view crashed the server. ([Bug#7015](#))
- Some data definition statements (`CREATE TABLE` where the table was not a temporary table, `TRUNCATE TABLE`, `DROP DATABASE`, and `CREATE DATABASE`) were not being written to the binary log after a `ROLLBACK`. This also caused problems with replication. ([Bug#6883](#))

E.1.23. Changes in MySQL 5.0.7 (10 June 2005)

Functionality added or changed:

- Improved the optimizer to be able to use indexes for expressions of the form `indexed_col NOT IN (val1, val2, ...)` and `indexed_col NOT BETWEEN val1 AND val2 ..` ([Bug#10561](#))
- The `table`, `type`, and `rows` columns of `EXPLAIN` output can now be `NULL`. This is required for using `EXPLAIN` on `SELECT` queries that use no tables (for example, `EXPLAIN SELECT 1`). ([Bug#9899](#))
- All characters occurring on the same line following the `DELIMITER` keyword will be set as delimiter. For example, `DELIMITER ;` will set `;` as the delimiter. This behavior is now consistent between MySQL 5.1 and MySQL 5.0. ([Bug#9879](#))
- Added `mysql_set_character_set()` C API function for setting the default character set of the current connection. This allows clients to affect the character set used by `mysql_real_escape_string()`. ([Bug#8317](#))
- The `--delayed-insert` option for `mysqldump` has been disabled to avoid causing problems with storage engines that do not support `INSERT DELAYED`. ([Bug#7815](#))
- Placeholders now can be used for `LIMIT` in prepared statements. ([Bug#7306](#))
- **InnoDB**: In stored procedures and functions, **InnoDB** no longer takes full explicit table locks for every involved table. Only 'intention' locks are taken, similar to those in the execution of an ordinary SQL statement. This greatly reduces the number of deadlocks.
- `SHOW BINARY LOGS` now displays a `File_size` column that indicates the size of each file.
- Security improvement: Applied a patch to fix a UDF library-loading vulnerability that could result in a buffer overflow and code execution. ([CVE-2005-2558](#))
- Removed `WinMySQLAdmin` from the source distribution and from the "No Installer" Windows distribution (it had already been removed from the "With Installer" distribution before).
- The behavior of the `Last_query_cost` system variable has been changed. The default value is now 0 (rather than -1) and it now has session-level scope (rather than being global). See [Section 5.2.5, "Status Variables"](#), for additional information.
- Removed `mysqlshutdown.exe` and `mysqlwatch.exe` from the Windows "No Installer" distribution (they had already been removed from the "With Installer" distribution before). Removed those programs from the source distribution.

Bugs fixed:

- MySQL would pass an incorrect key length to storage engines for `MIN()`. This could cause warnings `InnoDB: Warning: using a partial-field key prefix in search.` in the `.err` log. ([Bug#13218](#), [Bug#11039](#))
- Fixed a portability problem for compiling on Windows with Visual Studio 6. ([Bug#11153](#))
- Corrected a problem where an incorrect data type was returned in the result set metadata when using a prepared `SELECT DISTINCT` statement to select from a view. ([Bug#11111](#))
- Fixed a server crash resulting from an attempt to allocate too much memory when `GROUP BY blob_col` and `COUNT(DISTINCT)` were used. ([Bug#11088](#))
- Multiple-row `REPLACE` could fail on a duplicate-key error when having one `AUTO_INCREMENT` key and one unique key. ([Bug#11080](#))
- **InnoDB**: Fixed a duplicate key error that occurred with `REPLACE` in a table with an `AUTO-INC` column. ([Bug#11005](#))
- Fixed a failure of `WITH ROLLUP` to sum values properly. ([Bug#10982](#))

- **Security update:** A user with limited privileges could obtain information about the privileges of other users by querying objects in the `INFORMATION_SCHEMA` database for which that user did not have the requisite privileges. (Bug#10964)
- Fixed bug in `FIELD()` function where value list contains `NULL`. (Bug#10944)
- Failure of a `BEFORE` trigger did not prevent the triggering statement from performing its operation on the row for which the trigger error occurred. Now the triggering statement fails as described in Section 19.3, “Using Triggers”. (Bug#10902)
- The `FEDERATED` storage engine properly handled outer joins, but not inner joins. (Bug#10848)
- `InnoDB`: Fixed `InnoDB: Error: stored_select_lock_type is 0 inside ::start_stmt()!` in a stored procedure call if `innodb_locks_unsafe_for_binlog` was set in `my.cnf`. (Bug#10746)
- Executing `LOAD INDEX INTO CACHE` for a table while other threads were selecting from the table caused a deadlock. (Bug#10602)
- The `TIME_FORMAT()` function returned incorrect results with some format specifiers. See Section 11.6, “Date and Time Functions”. (Bug#10590)
- The `LAST_DAY()` failed to return `NULL` when supplied with an invalid argument. See Section 11.6, “Date and Time Functions”. (Bug#10568)
- A problem with the `my_global.h` file caused compilation of MySQL to fail on single-processor Linux systems running 2.6 kernels. (Bug#10364)
- Corrected inappropriate error messages that were displayed when attempting to set the read-only `warning_count` and `error_count` system variables. (Bug#10339)
- Fixed bug in the MySQL Instance manager that caused the version to always be `unknown` when `SHOW INSTANCE STATUS` was issued. (Bug#10229)
- Fixed a server crash resulting from `CREATE TABLE ... SELECT` that selected from a table being altered by `ALTER TABLE`. (Bug#10224)
- Fixed a server crash resulting from invalid string pointer when inserting into the `mysql.host` table. (Bug#10181)
- Consistently report `INFORMATION_SCHEMA` table names in uppercase in `SHOW TABLE STATUS` output. (Bug#10059)
- Fixed a server crash resulting from accessing `InnoDB` tables within stored functions. This is handled by prohibiting statements that do an implicit or explicit commit or rollback within stored functions or triggers. (Bug#10015)
- Issuing a write lock for a table from one client prevented other clients from accessing the table's metadata. For example, if one client issued a `LOCK TABLES mydb.mytable WRITE`, then a second client attempting to execute a `USE mydb;` would hang. (Bug#9998)
- Dropping stored routines when the MySQL server had been started with `--skip-grant-tables` generated extraneous warnings. (Bug#9993)
- The `mysql_next_result()` function could hang if you were executing many statements in a `mysql_real_query()` call and one of those statements raised an error. (Bug#9992)
- The functions `COALESCE()`, `IF()`, and `IFNULL()` performed incorrect conversions of their arguments. (Bug#9939)
- Fixed a problem with returning an incorrect result from a view that selected a `COALESCE()` expression from the result of an outer join. (Bug#9938)
- `InnoDB`: Do very fast shutdown only if `innodb_fast_shutdown=2`, but wait for threads to exit and release allocated memory if `innodb_fast_shutdown=1`. Starting with MySQL/InnoDB 5.0.5, `InnoDB` would do brutal shutdown also when `innodb_fast_shutdown=1`. (Bug#9673)
- Using `ORDER BY` to sort the results of an `IF()` that contained a `FROM_UNIXTIME()` expression returned incorrect results due to integer overflow. (Bug#9669)
- On Windows, with `lower_case_table_names` set to 2, using `ALTER TABLE` to alter a `MEMORY` or `InnoDB` table that had a mixed-case name also improperly changed the name to lowercase. (Bug#9660)
- The combination of `COUNT()`, `DISTINCT`, and `CONCAT()` sometimes triggered a memory deallocation bug on Windows resulting in a server crash. (Bug#9593)
- `INSERT BEFORE` triggers were not being activated for implicit inserts (`LOAD DATA`). (Bug#8755)

- The `ucs2_turkish_ci` collation failed with `upper('i')`. `UPPER/LOWER` now can return a string with different length. (Bug#8610)
- The server timed out SSL connections too quickly on Windows. (Bug#8572)
- If a stored function contained a `FLUSH` statement, the function crashed when invoked. `FLUSH` now is disallowed within stored functions. (Bug#8409)
- `OPTIMIZE` of `InnoDB` table does not return 'Table is full' if out of tablespace. (Bug#8135)
- Fixed a problem causing an incorrect result for columns that include an aggregate function as part of an expression when `WITH ROLLUP` is added to `GROUP BY`. (Bug#7914)
- `GROUP BY` queries with `ROLLUP` returned wrong results for expressions containing group by columns. (Bug#7894)
- Fixed a server crash resulting from the second invocation of a stored procedure that selected from a view defined as a join that used `ON` in the join conditions. (Bug#6866)
- `INSERT BEFORE` triggers were not being activated for `INSERT ... SELECT` statements. (Bug#6812)
- Fixed a server crash for `INSERT` or `UPDATE` when the `WHERE` clause contained a correlated subquery that referred to a column of the table being modified. (Bug#6384)
- MySQL was adding a `DEFAULT` clause to `ENUM` columns that included no explicit `DEFAULT` and were defined as `NOT NULL`. (This is supposed to happen only for columns that are `NULL`.) (Bug#6267)
- Using `ALTER TABLE` for a table that had a trigger caused a crash when executing a statement that activated the trigger, and also a crash later with `USE db_name` for the database containing the table. (Bug#5894)
- Triggers with dropped functions caused crashes. (Bug#5893)
- Triggers were not being activated for multiple-table `UPDATE` or `DELETE` statements. (Bug#5860)
- The incorrect sequence of statements `HANDLER tbl_name READ index_name NEXT` without a preceding `HANDLER tbl_name READ index_name = (value_list)` for an `InnoDB` table resulted in a server crash rather than an error. (Bug#5373)
- Multiple-table `DELETE` did always delete on the fly from the first table that was to be deleted from. In some cases, when using many tables and it was necessary to access the same row twice in the first table, we could miss some rows-to-be-deleted from other tables. This is now fixed.

E.1.24. Changes in MySQL 5.0.6 (26 May 2005)

Functionality added or changed:

- **Incompatible change:** The behavior of `LOAD DATA INFILE` and `SELECT ... INTO OUTFILE` has changed when the `FIELDS TERMINATED BY` and `FIELDS ENCLOSED BY` values both are empty. Formerly, a column was read or written the display width of the column. For example, `INT(4)` was read or written using a field with a width of 4. Now columns are read and written using a field width wide enough to hold all values in the field. However, data files written before this change was made might not be reloaded correctly with `LOAD DATA INFILE` for MySQL 4.1.12 and up. This change also affects data files read by `mysqlimport` and written by `mysqldump --tab`, which use `LOAD DATA INFILE` and `SELECT ... INTO OUTFILE`. For more information, see [Section 12.2.5, “LOAD DATA INFILE Syntax”](#). (Bug#12564)
- **Incompatible change:** `MyISAM` and `InnoDB` tables created with `DECIMAL` columns in MySQL 5.0.3 to 5.0.5 will appear corrupt after an upgrade to MySQL 5.0.6. Dump such tables with `mysqldump` before upgrading, and then reload them after upgrading. (The same incompatibility will occur for these tables created in MySQL 5.0.6 after a downgrade to MySQL 5.0.3 to 5.0.5.) (Bug#10465, Bug#10625)
- When the server cannot read a table because it cannot read the `.frm` file, print a message that the table was created with a different version of MySQL. (This can happen if you create tables that use new features and then downgrade to an older version of MySQL.) (Bug#10435)
- The `GRANT` and `REVOKE` statements now support an `object_type` clause to be used for disambiguating whether the grant object is a table, a stored function, or a stored procedure. Use of this clause requires that you upgrade your grant tables. See [Section 5.5.4, “mysql_fix_privilege_tables — Upgrade MySQL System Tables”](#). (Bug#10246)
- Added `REFERENCED_TABLE_SCHEMA`, `REFERENCED_TABLE_NAME`, and `REFERENCED_COLUMN_NAME` columns to the `KEY_COLUMN_USAGE` table of `INFORMATION_SCHEMA`. (Bug#9587)
- New `/*>` prompt for `mysql`. This prompt indicates that a `/* ... */` comment was begun on an earlier line and the closing

- * / sequence has not yet been seen. (Bug#9186)
- The `INFORMATION_SCHEMA.SCHEMATA` table now has a `DEFAULT_COLLATION_NAME` column. (Bug#8998)
- Added a `--show-warnings` option to `mysql` to cause warnings to be shown after each statement if there are any. This option applies to interactive and batch mode. In interactive mode, `\w` and `\W` may be used to enable and disable warning display. (Bug#8684)
- If strict SQL mode is enabled, `VARCHAR` and `VARBINARY` columns with a length greater than 65,535 no longer are silently converted to `TEXT` or `BLOB` columns. Instead, an error occurs. (Bug#8295, Bug#8296)
- Removed a limitation that prevented use of FIFOs as logging targets (such as for the general query log). This modification *does not apply* to the binary log and the relay log. (Bug#8271)
- `SHOW VARIABLES` now shows the `slave_compressed_protocol`, `slave_load_tmpdir` and `slave_skip_errors` system variables. (Bug#7800)
- **InnoDB:** When the maximum length of `SHOW INNODB STATUS` output would be exceeded, truncate the beginning of the list of active transactions, instead of truncating the end of the output. (Bug#5436)
- Updated version of `libedit` to 2.9. (Bug#2596)
- **InnoDB:** If `innodb_locks_unsafe_for_binlog` option is set and the isolation level of the transaction is not set to serializable then **InnoDB** uses a consistent read for select in clauses like `INSERT INTO ... SELECT` and `UPDATE ... (SELECT)` that do not specify `FOR UPDATE` or `IN SHARE MODE`. Thus no locks are set to rows read from selected table.
- Added the `div_precision_increment` system variable, which indicates the number of digits by which to increase the scale of the result of division operations performed with the `/` operator.
- Removed `mysqlshutdown.exe` and `mysqlwatch.exe` from the Windows “With Installer” distribution.
- The precision of the `DECIMAL` data type has been increased from 64 to 65 decimal digits.
- Added the `--log-bin-trust-routine-creators` server option for setting the `log_bin_trust_routine_creators` system variable from the command line.
- Implemented the `STMT_ATTR_PREFETCH_ROWS` option for the `mysql_stmt_attr_set()` C API function. This sets how many rows to fetch at a time when using cursors with prepared statements.
- Added the `log_bin_trust_routine_creators` system variable, which applies when binary logging is enabled. It controls whether stored routine creators can be trusted not to create stored routines that will cause unsafe events to be written to the binary log.
- Removed unused system variable `myisam_max_extra_sort_file_size`.
- Changed default value of `myisam_data_pointer_size` from 4 to 6. This allows us to avoid `table is full` errors for most cases.
- Added a `--debug` option to `my_print_defaults`.
- The variable `concurrent_insert` now takes 3 values. Setting this to 2 changes **MyISAM** to do concurrent inserts to end of table if table is in use by another thread.

Bugs fixed:

- **Security Fix:** `mysql_install_db` created the `mysql_install_db.X` file with a predictable filename and insecure permissions, which allowed local users to execute arbitrary SQL commands by modifying the file's contents. (CVE-2005-1636)
- `MERGE` tables could fail on Windows due to incorrect interpretation of pathname separator characters for filenames in the `.MRG` file. (Bug#10687)
- Fixed a server crash resulting from repeated calls to `ABS()` when the argument evaluated to `NULL`. (Bug#10599)
- Statements that create and drop triggers were not being written to the binary log, which affects replication and data recovery options. Trigger-related statements now are logged, subject to the issues and limitations discussed in Section 18.4, “Binary Logging of Stored Routines and Triggers”. (Bug#10417)
- `SELECT 0/0` returned 0 rather than `NULL`. (Bug#10404)

- Fixed a server crash for `INSERT ... ON DUPLICATE KEY UPDATE` with `MERGE` tables, which do not have unique indexes. (Bug#10400)
- `InnoDB`: Fixed a critical bug in `InnoDB AUTO_INCREMENT`: it could assign the same value for several rows. `InnoDB`: All `InnoDB` bug fixes from 4.1.12 and earlier versions. (Bug#10359, Bug#10335, Bug#10607)
- Fixed a `mysqldump` crash that occurred with the `--complete-insert` option when dumping tables with a large number of long column names. (Bug#10286)
- Incomplete results were returned from `INFORMATION_SCHEMA.COLUMNS` for `INFORMATION_SCHEMA` tables for non-`root` users. (Bug#10261)
- Fixed a portability problem in compiling `mysql.cc` with `VC++` on Windows. (Bug#10245)
- Portability fix for Cygwin: Don't use `#pragma interface` in source files. (Bug#10241)
- Corrected a problem where `DEFAULT` values were not assigned properly to `BIT(1)` or `CHAR(1)` columns if certain other columns preceded them in the table definition. (Bug#10179)
- Fixed a server crash in the `BLACKHOLE` storage engine. (Bug#10175)
- The optimizer was choosing suboptimal execution plans for certain outer joins where the right table of a left join (or left table of a right join) had both `ON` and `WHERE` conditions. (Bug#10162)
- Corrected a problem resolving outer column references in correlated subqueries when using the prepared statements. (Bug#10041)
- Fixed a problem with `INFORMATION_SCHEMA` tables being inaccessible depending on lettercase used to refer to them. (Bug#10018)
- Fixed some `awk` script portability problems in `cmd-line-utils/libedit/makelist.sh`. (Bug#9954)
- Corrected the error message for exceeding the `MAX_CONNECTIONS_PER_HOUR` limit to say `max_connections_per_hour` instead of `max_connections`. (Bug#9947)
- For a user-defined function invoked from within a prepared statement, the UDF's initialization routine was invoked for each execution of the statement, but the deinitialization routine was not. (It was invoked only when the statement was closed.) Similarly, when invoking a UDF from within a trigger, the initialization routine was invoked but the deinitialization routine was not. For UDFs that have an expensive deinit function (such as `myperl`, this bugfix will have negative performance consequences. (Bug#9913)
- `RENAME TABLE` for an `ARCHIVE` table failed if the `.arn` file was not present. (Bug#9911)
- Fixed a server crash resulting from a `CHECK TABLE` statement where the arguments were a view name followed by a table name. (Bug#9897)
- `my_print_defaults` was ignoring the `--defaults-extra-file` option or crashing when the option was given. (Bug#9851, Bug#9136)
- The `INFORMATION_SCHEMA.COLUMNS` table was missing columns of views for which the user has access. (Bug#9838)
- Fixed a server crash resulting from use of a `CHAR` or `VARCHAR` column with `MIN()` or `MAX()` and `GROUP BY ... WITH ROLLUP`. (Bug#9820)
- Fixed a server crash resulting from use of `DISTINCT AVG()` with `GROUP BY ... WITH ROLLUP`. (Bug#9800)
- Fixed a server crash resulting from use of `AVG(DISTINCT)` with `GROUP BY ... WITH ROLLUP`. (Bug#9799)
- Fixed a server crash when using `GROUP BY ... WITH ROLLUP` on an indexed column in an `InnoDB` table. (Bug#9798)
- Corrected some failures of prepared statements for SQL (`PREPARE` plus `EXECUTE`) to return all rows for some `SELECT` statements. (Bug#9777, Bug#9096)
- Fix `CREATE TABLE ... LIKE` to work when `lower_case_table_names` is set on a case-sensitive filesystem and the source table name is not given in lowercase. (Bug#9761)
- Corrected an inability to select from a view within a stored procedure. (Bug#9758)
- `net_read_timeout` and `net_write_timeout` were not being respected on Windows. (Bug#9721)
- Fixed problems with static variables and do not link with `libsupc++` to allow building on FreeBSD 5.3. (Bug#9714)

- The `mysql_stmt_attr_set()` C API function now returns an error for option values that are defined in `mysql.h` but not yet implemented, such as `CURSOR_TYPE_SCROLLABLE`. (Bug#9643)
- Fixed incorrect memory block allocation for the query cache in the embedded server. (Bug#9549)
- `CREATE TABLE t AS SELECT UUID()` created a `VARCHAR(12)` column, which is too small to hold the 36-character result from `UUID()`. (Bug#9535)
- Fixed a server crash resulting from use of `SELECT DISTINCT` with a prepared statement that uses a cursor. (Bug#9520)
- Fixed a problem with mishandling of `NULL` key parts in hash indexes on `VARCHAR` columns, resulting in incorrect query results. (Bug#9489, Bug#10176)
- Within a stored procedure, attempting to update a view defined as an inner join failed with a `Table 'tbl_name' was locked with a READ lock and can't be updated` error. (Bug#9481)
- The `mysql_stmt_execute()` and `mysql_stmt_reset()` C API functions now close any cursor that is open for the statement, which prevents a server crash. (Bug#9478)
- `SELECT` from `INFORMATION_SCHEMA` tables failed if the statement has a `GROUP BY` clause and an aggregate function in the select list. (Bug#9404)
- `MAX()` for an `INT UNSIGNED` (unsigned 4-byte integer) column could return negative values if the column contained values larger than 2^{31} . (Bug#9298)
- Disallow use of `SESSION` or `GLOBAL` for user variables or local variables in stored routines. (Bug#9286)
- Disabled binary logging within stored routines to avoid writing spurious extra statements to the binary log. For example, if a routine `p()` executes an `INSERT` statement, then for `CALL p()`, the `CALL` statement appears in the binary log, but not the `INSERT` statement. (Bug#9100)
- Fix `FORMAT()` to do better rounding for double values (for example, `FORMAT(4.55, 1)` returns `4.6`, not `4.5`). (Bug#9060)
- `SHOW CREATE VIEW` got confused and could not find the view if there was a temporary table with the same name as the view. (Bug#8921)
- Selecting from a single-table view defined on multiple-table views caused a server crash. (Bug#8528)
- Remove extra slashes in `--tmpdir` value (for example, convert `/var//tmp` to `/var/tmp`, because they caused various errors. (Bug#8497)
- Invoking a stored function that executed a `SHOW` statement resulted in a server crash. (Bug#8408)
- An error in the implementation of the `MyISAM` compression algorithm caused `myisampack` to fail with very large sets of data (total size of all the records in a single column needed to be ≥ 3 GB in order to trigger this issue). (Bug#8321)
- Added `Create_routine_priv`, `Alter_routine_priv`, and `Execute_priv` privileges to the `mysql.host` privilege table. (They had been added to `mysql.db` in MySQL 5.0.3 but not to the `host` table.) (Bug#8166)
- Fixed a deadlock resulting from use of `FLUSH TABLES WITH READ LOCK` while an `INSERT DELAYED` statement is in progress. (Bug#7823)
- In strict SQL mode, some assignments to numeric columns that should have been rejected were not (such as the result of an arithmetic expression or an explicit `CAST()` operation). (Bug#6961)
- For `MERGE` tables, avoid writing absolute pathnames in the `.MRG` file for the names of the constituent `MyISAM` tables so that if the data directory is moved, `MERGE` tables will not break. For `mysqld`, write just the `MyISAM` table name if it is in the same database as the `MERGE` table, and a path relative to the data directory otherwise. For the embedded servers, absolute pathnames may still be used. (Bug#5964)
- Fixed server crash resulting from multiple calls to a stored procedure that assigned the result of a subquery to a variable or compared it to a value with `IN`. (Bug#5963)
- If the file named by a `--defaults-extra-file` option does not exist or is otherwise inaccessible, an error now occurs. (Bug#5056)
- Statements that create and use stored routines were not being written to the binary log, which affects replication and data recovery options. Stored routine-related statements now are logged, subject to the issues and limitations discussed in Section 18.4, “Binary Logging of Stored Routines and Triggers”. (Bug#2610)
- Fixed `configure` to properly recognize whether NPTL is available on Linux. (Bug#2173)

E.1.25. Changes in MySQL 5.0.5 (Not released)

No public release of MySQL 5.0.5 was made. The changes described in this section are available in MySQL 5.0.6.

Functionality added or changed:

- **InnoDB:** When `FOREIGN_KEY_CHECKS=0`, `ALTER TABLE` and `RENAME TABLE` will ignore any type incompatibilities between referencing and referenced columns. Thus, it will be possible to convert the character sets of columns that participate in a foreign key. Be sure to convert all tables before modifying any data! (Bug#9802)
- `SHOW VARIABLES` no longer displays the deprecated `log_update` system variable. (Bug#9738)
- Added support for the `BIT` data type to the `MEMORY`, `InnoDB`, and `BDB` storage engines.
- The behavior controlled by the `--innodb-fast-shutdown` option now can be changed at runtime by setting the value of the global `innodb_fast_shutdown` system variable. It now accepts values 0, 1 and 2 (except on Netware where 2 is disabled). If set to 2, then when the MySQL server shuts down, `InnoDB` will just flush its logs and shut down brutally (and quickly) as if a MySQL crash had occurred; no committed transaction will be lost, but a crash recovery will be done at next startup.

Bugs fixed:

- Fixed a memory leak that occurred when selecting from a view that contained a subquery. (Bug#10107)
- Setting the `storage_engine` system variable to `MEMORY` succeeded, but retrieving the variable resulted in a value of `HEAP` (the old name for the `MEMORY` storage engine) rather than `MEMORY`. (Bug#10039)
- **Security fix:** If `mysqld` was started with `--user=non_existent_user`, it would run using the privileges of the account it was invoked from, even if that was `root`. (Bug#9833)
- Starting `mysqld` with the `--skip-innodb` and `--default-storage-engine=innodb` (or `--default-table-type=innodb`) caused a server crash. (Bug #Bug#9815)
- Queries containing `CURRENT_USER()` incorrectly were registered in the query cache. (Bug#9796)
- Fixed a server crash resulting from invocation of a stored function that returned a value having an `ENUM` or `SET` data type. (Bug#9775)
- Fixed a string-length comparison problem that caused `mysql` to fail loading dump files containing certain “\”-sequences. (Bug#9756)
- Fixed a problem where, after an internal temporary table in memory became too large and had to be converted to an on-disk table, the error indicator was not cleared and the query failed with error 1023 (`Can't find record in '`). (Bug#9703)
- Use of a subquery that used `WITH ROLLUP` in the `FROM` clause of the main query sometimes resulted in a `Column cannot be null` error. (Bug#9681)
- Fixed a `readline`-related crash in `mysql` when the user pressed Control-R. (Bug#9568)
- Executing `LOCK TABLES` and then calling a stored procedure caused an error and resulting in the server thinking that no stored procedures exist. (Bug#9566)
- The server died with signal 11 if a non-existent location was specified for the location of the binary log. Now the server exits after printing an appropriate error message. (Bug#9542)
- Incorrect results were returned for queries of the form `SELECT ... LEFT JOIN ... WHERE EXISTS (subquery)`, where the subquery selected rows based on an `IS NULL` condition. (Bug#9516)
- Fixed a segmentation fault in `mysqlcheck` that occurred when the last table checked in `--auto-repair` mode returned an error (such as the table being a `MERGE` table). (Bug#9492)
- Within a stored procedure, attempting to execute a multiple-table `UPDATE` failed with a `Table 'tbl_name' was locked with a READ lock and can't be updated` error. (Bug#9486)
- `mysqlshow` displayed an incorrect row count for tables. (Bug#9391)
- **InnoDB:** Fixed a bug where next-key locking doesn't allow the insert which does not produce a phantom. If the range is of type `'a' <= uniquecolumn`, `InnoDB` lock only the `RECORD`, if the record with the column value `'a'` exists in a `CLUSTERED` index. This allows inserts before a range. (Bug#9354)

- Fixed an optimizer bug in computing the union of two ranges for the `OR` operator. (Bug#9348)
- Corrected a failure to resolve a column reference correctly for a `LEFT JOIN` that compared a join column to an `IN` subquery. (Bug#9338)
- Fixed a problem with `OPTIMIZE TABLE` for `InnoDB` tables being written twice to the binary log. (Bug#9149)
- Multiple-table updates could produce spurious data-truncation warnings if they used a join across columns that are indexed using a column prefix. (Bug#9103)
- Fixed a server crash resulting from invocation of a stored function that returned a value having a `BLOB` data type. (Bug#9102)
- For stored functions that should return a `YEAR` value, corrected a failure of the value to be in `YEAR` format. (Bug#8861)
- Selecting from a view containing a subquery caused the server to hang. (Bug#8490)
- `TIMEDIFF()` with a negative time first argument and positive time second argument produced incorrect results. (Bug#8068)
- Fixed a server crash resulting from invocation of a stored function that returned a value having a `BIT` data type. (Bug#7648)
- Provide more informative error messages in clustered setting when a query is issued against a table that has been modified by another `mysqld` server. (Bug#6762)
- `SET @var= CAST(NULL AS [INTEGER|CHAR])` now sets the result type of the variable to `INTEGER/CHAR`. (Bug#6598)
- Fixed a problem in the client/server protocol where the server closed the connection before sending the final error message. The problem could show up as a `Lost connection to MySQL server during query` when attempting to connect to access a non-existent database. (Bug#6387, Bug#9455)
- Fixed a failure to resolve a column reference properly when an outer join involving a view contained a subquery and the column was used in the subquery and the outer query. (Bug#6107, Bug#6106)
- `InnoDB`: Prevent `ALTER TABLE` from changing the storage engine if there are foreign key constraints on the table. (Bug#5574, Bug#5670)

E.1.26. Changes in MySQL 5.0.4 (16 April 2005)

Functionality added or changed:

- Added `ENGINE=MyISAM` table option when creating `mysql.proc` table in `mysql_create_system_tables` script to make sure the table is created as a `MyISAM` table even if the default storage engine has been changed. (Bug#9496)
- `SHOW CREATE TABLE` for an `INFORMATION_SCHEMA` table no longer prints a `MAX_ROWS` value because the value has no meaning. (Bug#8941)
- Invalid `DEFAULT` values for `CREATE TABLE` now generate errors. (Bug#5902)
- Added `--show-table-type` option to `mysqlshow`, to display a column indicating the table type, as in `SHOW FULL TABLES`. (Bug#5036)
- New configuration directives `!include` and `!includedir` implemented for including option files and searching directories for option files. See Section 4.3.2, “Using Option Files”, for usage.
- Added `--with-big-tables` compilation option to `configure`. (Previously it was necessary to pass `-DBIG_TABLES` to the compiler manually in order to enable large table support.) See Section 2.4.15.2, “Typical configure Options”, for details.
- The way the time zone information is stored in the binary log was changed, so that it is now possible to have a replication master and slave running with different global time zones. A drawback is that replication from 5.0.4 masters to pre-5.0.4 slaves is impossible.

Bugs fixed:

- `mysql.server` no longer uses non-portable `alias` command or LSB functions. (Bug#9852)
- A server installed as a Windows service and started with `--shared-memory` could not be stopped. (Bug#9665)

- Selecting a `BIT` column failed if the binary client/server protocol was used. (Bug#9608)
- Fixed a server crash when creating a `PRIMARY KEY` for a table, if the table contained a `BIT` column. (Bug#9571)
- `InnoDB`: `ENUM` and `SET` columns were treated incorrectly as character strings. This bug did not manifest itself with `latin1` collations if there were less than about 100 elements in an `ENUM`, but it caused malfunction with `UTF-8`. Old tables will continue to work. In new tables, `ENUM` and `SET` will be internally stored as unsigned integers. (Bug#9526)
- Fixed a bug in division of floating point numbers. It could cause nine zeros (`00000000`) to be inserted in the middle of the quotient. (Bug#9501)
- Fixed option-parsing code for the embedded server to understand `K`, `M`, and `G` suffixes for the `net_buffer_length` and `max_allowed_packet` options. (Bug#9472)
- Some user variables were not being handled with “implicit” coercibility. (Bug#9425)
- Fixed server crashes for `CREATE TABLE ... SELECT` or `INSERT INTO ... SELECT` when selecting from multiple-table view. (Bug#9398, Bug#8703)
- Fixed a server crash resulting from multiple executions of a prepared statement involving a join of an `INFORMATION_SCHEMA` table with another table. (Bug#9383)
- `InnoDB`: Avoid test suite failures caused by a locking conflict between two server instances at server shutdown/startup. This conflict on advisory locks appears to be the result of a bug in the operating system; these locks should be released when the files are closed, but somehow that does not always happen immediately in Linux. (Bug#9381)
- Allow extra HKSCS and cp950 characters (`big5` extension characters) to be accepted in `big5` columns. (Bug#9357)
- The value of the `CHARACTER_MAXIMUM_LENGTH` and `CHARACTER_OCTET_LENGTH` columns of the `INFORMATION_SCHEMA.COLUMNS` table must be `NULL` for numeric columns, but were not. (Bug#9344)
- `INFORMATION_SCHEMA` tables had an implicit upper limit for the number of rows. As a result, not all data could be returned for some queries. (Bug#9317)
- `InnoDB`: True `VARCHAR`: `InnoDB` stored the 'position' of a row wrong in a column prefix primary key index; this could cause MySQL to complain `ERROR 1032: Can't find record ...` in an update of the primary key, and also some `ORDER BY` or `DISTINCT` queries. (Bug#9314)
- Fixed a problem with `ORDER BY` that sometimes caused incorrect sorting of `utf8` data. (Bug#9309)
- Fixed `utf8_spanish2_ci` and `ucs2_spanish2_ci` collations to not consider “`r`” equal to “`rr`”. If you upgrade to this version from an earlier version, you should rebuild the indexes of affected tables. (Bug#9269)
- `CREATE OR REPLACE VIEW` and `ALTER VIEW` now require the `CREATE VIEW` and `DROP` privileges, not `CREATE VIEW` and `DELETE`. (`DELETE` is a row-level privilege, not a table-level privilege.) (Bug#9260)
- Fixed a server crash resulting from `GROUP BY` on a decimal expression. (Bug#9210)
- `mysqldump` dumped core when invoked with `--tmp` and `--single-transaction` options and a non-existent table name. (Bug#9175)
- Fixed a server crash after a call to `mysql_stmt_close()` for single-row result set. (Bug#9159)
- Setting the `max_error_count` system variable to 0 resulted in a setting of 1. (Bug#9072)
- The use of `XOR` together with `NOT ISNULL()` erroneously resulted in some outer joins being converted to inner joins by the optimizer. (Bug#9017)
- Fixed a `Commands out of sync` error when two prepared statements for single-row result sets were open simultaneously. (Bug#8880)
- Fixed an optimizer problem where extraneous comparisons between `NULL` values in indexed columns were being done for operators such as `=` that are never true for `NULL`. (Bug#8877)
- Fixed the client/server protocol for prepared statements so that reconnection works properly when the connection is killed while reconnect is enabled. (Bug#8866)
- In prepared statements, subqueries containing parameters were erroneously treated as `const` tables during preparation, resulting in a server crash. (Bug#8807)
- Warning message from `GROUP_CONCAT()` did not always indicate correct number of lines. (Bug#8681)

- **InnoDB**: Fix bug in MySQL/InnoDB 5.0.3: SQL statements were not rolled back on error. (Bug#8650)
- Too many rows were returned from queries that combined `ROLLUP` and `LIMIT` if `SQL_CALC_FOUND_ROWS` was given. (Bug#8617)
- Incorrect results were returned from queries that combined `SELECT DISTINCT`, `GROUP BY`, and `ROLLUP`. (Bug#8616)
- Fixed server crash resulting from queries that combined `SELECT DISTINCT`, `SUM()`, and `ROLLUP`. (Bug#8615)
- The commit count cache for **NDB** was not properly invalidated when deleting a record using a cursor. (Bug#8585)
- Fixed a problem with the `tee` command in `mysql` that resulted in `mysql` crashing. (Bug#8499)
- Fixed a permissions problem whereby information in `INFORMATION_SCHEMA` could be exposed to a user with insufficient privileges. (Bug#7214)
- `DROP TABLE` did not drop triggers that were defined for the table. `DROP DATABASE` did not drop triggers in the database. (Bug#6559, Bug#5859)
- Link with `libsupc++` on Fedora Core 3 to get language support functions. (Bug#6554)
- Fixed a collation coercibility problem that caused a union between binary and non-binary columns to fail. (Bug#6519)
- Using `CONVERT('0000-00-00',date)` or `CAST('0000-00-00' as date)` with the `NO_ZERO_DATE` SQL mode enabled now produces a warning. (Bug#6145)
- **TRADITIONAL** SQL mode should prevent inserts where a column with no default value is omitted or set to a value of `DEFAULT`. Fixed cases where this restriction was not enforced. (Bug#5986)
- Inserting a zero date in a `DATE`, `DATETIME` or `TIMESTAMP` column during **TRADITIONAL** mode now produces an error. (Bug#5933)
- `CAST()` now produces warnings when casting incorrect `INTEGER` and `CHAR` values. This also applies to implicit `string` to `number` casts. (Bug#5912)
- An error now occurs if you try to insert an invalid value via a stored procedure in **STRICT** mode. (Bug#5907)
- `STR_TO_DATE()` now produces errors in strict mode (and warnings otherwise) when given an illegal argument. (Bug#5902)
- If, on a replication master a `LOAD DATA INFILE` operation was interrupted (by, for example, an integrity constraint violation or killed connection), the slave skipped the `LOAD DATA INFILE` entirely, thus missing changes if this command permanently inserted or updated table records before being interrupted. (Bug#3247)
- Inserting a zero date into a `DATETIME` column in **TRADITIONAL** mode now produces an error.
- `ALTER TABLE` now fails in **STRICT** mode if the alteration generates warnings.

E.1.27. Changes in MySQL 5.0.3 (23 March 2005: Beta)

Note

This Beta release, as any other pre-production release, should not be installed on “production” level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release.

Functionality added or changed:

- **Incompatible Change**: The C API `ER_WARN_DATA_TRUNCATED` warning symbol was renamed to `WARN_DATA_TRUNCATED`.
- **MySQL Cluster**: When using this storage engine, the output of `SHOW TABLE STATUS` now displays properly-calculated values in the `Avg_row_length` and `Data_length` columns. (Note that `BLOB` columns are not yet taken into account.) In addition, the number of replicas is now shown in the `Comment` column (as `number_of_replicas`).
- Fixed a problem with non-optimal `index_merge` query execution plans being chosen on IRIX. (Bug#8578)
- `mysqld_safe` will create the directory where the UNIX socket file is to be located if the directory does not exist. This applies only to the last component of the directory pathname. (Bug#8513)

- `ONLY_FULL_GROUP_BY` no longer is included in the `ANSI` composite SQL mode. (Bug#8510)
- The server now includes a timestamp in the `Ready for connections` message that is written to the error log at startup. (Bug#8444)
- Added a new global system variable `slave_transaction_retries`: if the replication slave SQL thread fails to execute a transaction because of an `InnoDB` deadlock or exceeded `InnoDB`'s `innodb_lock_wait_timeout` or `NDBCluster`'s `TransactionDeadlockDetectionTimeout` or `TransactionInactiveTimeout`, it automatically retries `slave_transaction_retries` times before stopping with an error. The default is 10. (Bug#8325)
- `CHECKSUM TABLE` returns a warning for non-existing tables. The checksum value remains `NULL` as before. (Bug#8256)
- Setting the connection collation to a value different from the server collation followed by a `CREATE TABLE` statement that included a quoted default value resulted in a server crash. (Bug#8235)
- When a client releases a user-level lock, `DO RELEASE_LOCK()` will not be written to the binary log anymore (this makes the binary log smaller); as a counterpart, the slave does not actually take the lock when it executes `GET_LOCK()`. This is mainly an optimization and should not affect existing setups. (Bug#7998)
- `InnoDB`: Corrected a bug in the crash recovery of `ROW_FORMAT=COMPACT` tables that caused corruption. There may still be bugs in the crash recovery, especially in `COMPACT` tables. (Bug#7973)
- Allowed the service-installation command for Windows servers to specify a single option other than `--defaults-file` following the service name. This is for compatibility with MySQL 4.1. (Bug#7856)
- Changed XML format for `mysql` from `<col_name>col_value</col_name>` to `<field name="col_name">col_value</field>` to allow for proper encoding of column names that are not legal as element names. (Bug#7811)
- `SHOW CREATE TABLE` now uses `USING index_type` rather than `TYPE index_type` to specify an index type. (Bug#7233)
- `InnoDB`: Implemented fast `TRUNCATE TABLE`. The old approach (deleting rows one by one) may be used if the table is being referenced by foreign keys. (Bug#7150)
- Fixed a problem with out-of-order packets being sent (`ERROR` after `OK` or `EOF`) following a `KILL QUERY` statement. (Bug#6804)
- Added `SQL_NOTES` session variable to cause `Note`-level warnings not to be recorded. (Bug#6662)
- Added `mysql_library_init()` and `mysql_library_end()` as synonyms for the `mysql_server_init()` and `mysql_server_end()` C API functions. `mysql_library_init()` and `mysql_library_end()` are `#define` symbols, but the names more clearly indicate that they should be called when beginning and ending use of a MySQL C API library no matter whether the application uses `libmysqlclient` or `libmysqld`. (Bug#6149)
- Added `VAR_POP()` and `STDDEV_POP()` as standard SQL aliases for the `VARIANCE()` and `STDDEV()` functions that compute population variance and standard deviation. Added new `VAR_SAMP()` and `STDDEV_SAMP()` functions to compute sample variance and standard deviation. (Bug#3190)
- `InnoDB`: Commit after every 10,000 copied rows when executing `ALTER TABLE`, `CREATE INDEX`, `DROP INDEX` or `OPTIMIZE TABLE`. This makes it much faster to recover from an aborted operation.
- Added support for `AVG(DISTINCT)`.
- A new `CREATE USER` privilege was added.
- Support for `RAID` options in `MyISAM` tables has been removed. If you have tables that use these options, you should convert them before upgrading. See Section 2.4.17.2, "Upgrading from MySQL 4.1 to 5.0".
- `InnoDB`: A shared record lock (`LOCK_REC_NOT_GAP`) is now taken for a matching record in the foreign key check because inserts can be allowed into gaps.
- The MySQL server now aborts when started with the option `--log-bin-index` and without `--log-bin`, and when started with `--log-slave-updates` and without `--log-bin`.
- API change: the `reconnect` flag in the `MYSQL` structure is now set to 0 by `mysql_real_connect()`. Only those client programs which didn't explicitly set this flag to 0 or 1 after `mysql_real_connect()` experience a change. Having automatic reconnection enabled by default was considered too dangerous (after reconnection, table locks, temporary tables, user and session variables are lost).
- Bit-field values can be written using `b'value'` notation. `value` is a binary value written using 0s and 1s.

- **InnoDB:** Relaxed locking in `INSERT ... SELECT`, single table `UPDATE ... (SELECT)` and single table `DELETE ... (SELECT)` clauses when `innodb_locks_unsafe_for_binlog` is used and isolation level of the transaction is not serializable. InnoDB uses consistent read in these cases for a selected table.
- **InnoDB** now supports a fast `TRUNCATE TABLE`. One visible change from this is that auto-increment values for this table are reset on `TRUNCATE`.
- **InnoDB:** Introduced a compact record format that does not store the number of columns or the lengths of fixed-size columns. The old format can be requested by specifying `ROW_FORMAT=REDUNDANT`. The new format (`ROW_FORMAT=COMPACT`) is the default. The new format typically saves 20% of disk space and memory.

The presence of the new compact row format decreases row storage space by about 20% at the cost of increasing CPU use for some operations. If your workload is a typical one that is limited by cache hit rates and disk speed it is likely to be faster. If it is a rare case that is limited by CPU speed, it might be slower.

- From the Windows distribution, predefined accounts without passwords for remote users ("`root@%`", "`@%`") were removed (other distributions never had them).
- Added the `FEDERATED` storage engine. See [Section 13.7, “The FEDERATED Storage Engine”](#).
- **InnoDB:** Setting the initial `AUTO_INCREMENT` value for an InnoDB table using `CREATE TABLE ... AUTO_INCREMENT = n` now works, and `ALTER TABLE ... AUTO_INCREMENT = n` resets the current value.
- User variable coercibility has been changed from “coercible” to “implicit.” That is, user variables have the same coercibility as column values.
- Security improvement: User-defined functions should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` by default no longer loads UDFs unless they have at least one auxiliary symbol defined in addition to the main symbol. The `--allow-suspicious-udfs` option controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off. `mysqld` also checks UDF filenames when it reads them from the `mysql.func` table and rejects those that contain directory pathname separator characters. (It already checked names as given in `CREATE FUNCTION` statements.) See [Section 26.2.4.1, “UDF Calling Sequences for Simple Functions”](#), [Section 26.2.4.2, “UDF Calling Sequences for Aggregate Functions”](#), and [Section 26.2.4.6, “User-Defined Function Security Precautions”](#). Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and informing us about this issue. (CVE-2005-0709, CVE-2005-0710)
- Added `--large-pages` option for `mysqld`.
- The `LOAD DATA` statement was extended to support user variables in the target column list, and an optional `SET` clause. Now one can perform some transformations on data after they have been read and before they are inserted into the table. For example:

```
LOAD DATA INFILE 'file.txt'
  INTO TABLE t1
  (column1, @var1)
  SET column2 = @var1/100;
```

Also, replication of `LOAD DATA` was changed, so you can't replicate such statements from a 5.0.3 master to pre-5.0.3 slaves.

- Added an `error` member to the `MYSQL_BIND` data structure that is used in the C API for prepared statements. This member is used for reporting data truncation errors. Truncation reporting is enabled via the new `MYSQL_REPORT_DATA_TRUNCATION` option for the `mysql_options()` C API function.
- Added `multi_read_range` system variable.
- The coercibility for the return value of functions such as `USER()` or `VERSION()` now is “system constant” rather than “implicit.” This makes these functions more coercible than column values so that comparisons of the two do not result in `Illegal mix of collations` errors. `COERCIBILITY()` was modified to accommodate this new coercibility value. See [Section 11.10.3, “Information Functions”](#).
- **InnoDB: Upgrading from 4.1:** The sorting order for end-space in `TEXT` columns for InnoDB tables has changed. Starting from 5.0.3, InnoDB compares `TEXT` columns as space-padded at the end. If you have a non-unique index on a `TEXT` column, you should run `CHECK TABLE` on it, and run `OPTIMIZE TABLE` if the check reports errors. If you have a `UNIQUE INDEX` on a `TEXT` column, you should rebuild the table with `OPTIMIZE TABLE`.
- Boolean full-text phrase searching now requires only that matches contain exactly the same words as the phrase and in the same order. Non-word characters no longer need match exactly.
- `my.cnf` in the compile-time `datadir` (usually `/usr/local/mysql/data/` in the binary tarball distributions) is not being read anymore. The value of the environment variable `MYSQL_HOME` is used instead of the hard-coded path.

- Additional control over transaction completion was implemented. The `COMMIT` and `ROLLBACK` statements support `AND [NO] CHAIN` and `RELEASE` clauses. There is a new `RELEASE SAVEPOINT` statement. The `completion_type` system variable was added for setting the global and session default completion type.
- Security improvement: The server creates `.frm`, `.MYD`, `.MYI`, `.MRG`, `.ISD`, and `.ISM` table files only if a file with the same name does not already exist. Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and informing us about this issue. (CVE-2005-0711)
- Added the `engine_condition_pushdown` system variable. For NDB, setting this variable to 1 allows processing of some `WHERE` clause conditions to be processed in NDB nodes before rows are sent to the MySQL server, rather than having rows sent to the server for evaluation.
- Support for the `ISAM` storage engine has been removed. If you have `ISAM` tables, you should convert them before upgrading. See [Section 2.4.17.2, “Upgrading from MySQL 4.1 to 5.0”](#).
- Added the `CREATE ROUTINE` and `ALTER ROUTINE` privileges, and made the `EXECUTE` privilege operational.
- `BIT` in column definitions now is a distinct data type; it no longer is treated as a synonym for `TINYINT(1)`.
- Added `cp932` (SJIS for Windows Japanese) and `eucajpm` (UJIS for Windows Japanese) character sets.
- The way the character set information is stored into the binary log was changed, so that it's now possible to have a replication master and slave running with different global character sets. A drawback is that replication from 5.0.3 masters to pre-5.0.3 slaves is impossible.
- `MEMORY (HEAP)` can have `VARCHAR()` fields.
- If the MySQL server is started without an argument to `--log-bin` and without `--log-bin-index`, thus not providing a name for the binary log index file, a warning is issued because MySQL falls back to using the hostname for that name, and this is prone to replication issues if the server's hostname's gets changed later. See [Section B.1.8.1, “Open Issues in MySQL”](#).
- `SHOW DATABASES`, `SHOW TABLES`, `SHOW COLUMNS`, and so forth display information about the `INFORMATION_SCHEMA` database. Also, several `SHOW` statements now accept a `WHERE` clause specifying which output rows to display. See [Chapter 21, *The INFORMATION_SCHEMA Database*](#).
- `SHOW COLUMNS` now displays `NO` rather than blank in the `Null` output column if the corresponding table column cannot be `NULL`.
- When the `MyISAM` storage engine detects corruption of a `MyISAM` table, a message describing the problem now is written to the error log.
- `VARCHAR` columns now remember end space. A `VARCHAR()` column can now contain up to 65535 bytes. For more details, see [Section E.1, “Changes in release 5.0.x \(Production\)”](#). If the table handler doesn't support the new `VARCHAR` type, then it's converted to a `CHAR` column. Currently this happens for `NDB` tables.
- Added `--innodb-checksums` and `--innodb-doublewrite` options for `mysqld`.
- Added several `InnoDB` status variables. See [Section 5.2.5, “Status Variables”](#).
- Added account-specific `MAX_USER_CONNECTIONS` limit, which allows you to specify the maximum number of concurrent connections for the account. Also, all limited resources now are counted per account (instead of being counted per user + host pair as it was before). Use the `--old-style-user-limits` option to get the old behavior.
- Implemented support for XA transactions. See [Section 12.4.7, “XA Transactions”](#). The implementation make the `innodb_safe_binlog` system variable obsolete, so it has been removed.
- `mysqlbinlog` now prints a `ROLLBACK` statement at the end of its output, in case the server crashed while it was in the process of writing the final entry into the last binary log named on the command line. This causes any half-written transaction to be rolled back when the output is executed. The `ROLLBACK` is harmless if the binary log file was written and closed normally.
- `Seconds_Behind_Master` is `NULL` (which means “unknown”) if the slave SQL thread is not running, or if the slave I/O thread is not running or not connected to master. It is zero if the SQL thread has caught up to the I/O thread. It no longer grows indefinitely if the master is idle.
- `FLUSH TABLES WITH READ LOCK` is now killable while it's waiting for running `COMMIT` statements to finish.
- The MySQL server aborts immediately instead of simply issuing a warning if it is started with the `--log-bin` option but cannot initialize the binary log at startup (that is, an error occurs when writing to the binary log file or binary log index file).
- The binary log file and binary log index file now are handled the same way as `MyISAM` tables when there is a “disk full” or “quota exceeded” error. See [Section B.1.4.3, “How MySQL Handles a Full Disk”](#).

- The `DECIMAL` and `NUMERIC` data types now are handled with a fixed-point library that allows for precision math handling that results in more accurate results. See [Chapter 22, Precision Math](#).

Warning: Incompatible change: A consequence of the change in handling of the `DECIMAL` and `NUMERIC` fixed-point data types is that the server is more strict to follow standard SQL. For example, a data type of `DECIMAL(3,1)` stores a maximum value of 99.9. Previously, the server allowed larger numbers to be stored. That is, it stored a value such as 100.0 as 100.0. Now the server clips 100.0 to the maximum allowable value of 99.9. If you have tables that were created before MySQL 5.0.3 and that contain floating-point data not strictly legal for the data type, you should alter the data types of those columns. For example:

```
ALTER TABLE tbl_name MODIFY col_name DECIMAL(4,1);
```

Warning: Incompatible change: For user-defined functions, exact-value decimal arguments such as `1.3` or `DECIMAL` column values were passed as `REAL_RESULT` values prior to MySQL 5.0.3. As of 5.0.3, they are passed as strings with a type of `DECIMAL_RESULT`. If you upgrade to 5.0.3 and find that your UDF now receives string values, use the initialization function to coerce the arguments to numbers as described in [Section 26.2.4.3, “UDF Argument Processing”](#).

For the `FLOOR()` and `CEILING()` functions, the return type is no longer always `BIGINT`. For exact-value numeric arguments, the return value has an exact-value numeric type. For string or floating-point arguments, the return value has a floating-point type.

- InnoDB:** When MySQL/InnoDB is compiled on Mac OS X 10.2 or earlier, detect the operating system version at run time and use the `fcntl()` file flush method on Mac OS X versions 10.3 and later. In Mac OS X, `fsync()` does not flush the write cache in the disk drive, but the special `fcntl()` does; however, the flush request is ignored by some external devices. Failure to flush the buffers may cause severe database corruption at power outages.

Bugs fixed:

- `mysqldump` misinterpreted “_” and “%” characters in the names of tables to be dumped as wildcard characters. ([Bug#9123](#))
- In strict or traditional SQL mode, too-long string values assigned to string columns (`CHAR`, `VARCHAR`, `BINARY`, `VARBINARY`, `TEXT`, or `BLOB`) were correctly truncated, but the server returned an SQLSTATE value of `01000` (should be `22001`). ([Bug#9029](#), [Bug#6999](#))
- The definition of the enumeration-valued `sql_mode` column of the `mysql.proc` table was missing some of the current allowable SQL modes, so stored routines would not necessarily execute with the SQL mode in effect at the time of routine definition. ([Bug#8902](#))
- Fixed a bug in `TRUNCATE`, which did not work within stored procedures. A workaround has been made so that within stored procedures, `TRUNCATE` is executed like `DELETE`. This was necessary because `TRUNCATE` is implicitly locking tables. ([Bug#8850](#))
- InnoDB:** Corrected the handling of trailing spaces in the `ucs2` character set. ([Bug#8771](#), [Bug#7350](#))
- Fixed a rare race condition which could lead to `FLUSH TABLES WITH READ LOCK` hanging. ([Bug#8682](#))
- `AES_DECRYPT(col_name, key)` could fail to return `NULL` for invalid values in `col_name`, if `col_name` was declared as `NOT NULL`. ([Bug#8669](#))
- If `SELECT DISTINCT` named an index column multiple times in the select list, the server tried to access different key fields for each instance of the column, which could result in a crash. ([Bug#8532](#))
- Fixed a bug in `MATCH ... AGAINST` in natural language mode that could cause a server crash if the `FULLTEXT` index was not used in a join (`EXPLAIN` did not show `fulltext` join mode) and the search query matched no rows in the table. ([Bug#8522](#))
- `REPAIR TABLE` did not invalidate query results in the query cache that were generated from the table. ([Bug#8480](#))
- Fixed `LOAD INDEX` statement to actually load index in memory. ([Bug#8452](#))
- If multiple semicolon-separated statements were received in a single packet, they were written to the binary log as a single event rather than as separate per-statement events. For a server serving as a replication master, this caused replication to fail when the event was sent to slave servers. ([Bug#8436](#))
- Fixed a bug in replication that caused the master to stamp generated statements (such as `SET` commands) with an `error_code` intended only for another statement. This could happen, for example, when a statements generates a duplicate key error on the master but must be replicated. ([Bug#8412](#))
- For a stored function that refers to a given table, invoking the function while selecting from the same table resulted in a server

- crash. (Bug#8405)
- Comparison of a `DECIMAL` column containing `NULL` to a subquery that produced `DECIMAL` values resulted in a server crash. (Bug#8397)
 - Fixed a server crash caused by `DELETE FROM tbl_name ... WHERE ... ORDER BY tbl_name.col_name` when the `ORDER BY` column was qualified with the table name. (Bug#8392)
 - Stored functions that used cursors could return incorrect results. (Bug#8386)
 - Fixed a problem with the Cyrillic letters I and SHORT I being treated the same by the `utf8_general_ci` collation. (Bug#8385)
 - Fixed a problem with boolean full-text searches on `utf8` columns where a double quote in the search string caused a server crash. (Bug#8351)
 - The `--set-character-set` option for `myisamchk` was changed to `--set-collation`. The value needed for specifying how to sort indexes is a collation name, not a character set name. (Bug#8349)
 - Corruption of `MyISAM` table indexes could occur with `TRUNCATE TABLE` if the table had already been opened. For example, this was possible if the table had been opened implicitly by selecting from a `MERGE` table that mapped to the `MyISAM` table. The server now issues an error message for `TRUNCATE TABLE` under these conditions. (Bug#8306)
 - For a query with both `GROUP BY` and `COUNT(DISTINCT)` clauses and a `FROM` clause with a subquery, `NULL` was returned for any `VARCHAR` column selected by the subquery. (Bug#8218)
 - Selecting from an `INFORMATION_SCHEMA` table combined with a subquery on an `INFORMATION_SCHEMA` table caused an error with the message `Table tbl_name is corrupted`. (Bug#8164)
 - Fixed handling of table-name matching in `mysqlhotcopy` to accommodate `DBD: :mysql 2.9003` and up (which implement identifier quoting). (Bug#8136)
 - Fixed server crash resulting from re-execution of prepared statements containing subqueries. (Bug#8125)
 - Fixed a problem with equality propagation optimization for prepared statements and stored procedures that caused a server crash upon re-execution of the prepared statement or stored procedure. (Bug#8115, Bug#8849)
 - If the slave was running with `--replicate-*-table` options which excluded one temporary table and included another, and the two tables were used in a single `DROP TEMPORARY TABLE IF EXISTS` statement, as the ones the master automatically writes to its binary log upon client's disconnection when client has not explicitly dropped these, the slave could forget to delete the included replicated temporary table. Only the slave needs to be upgraded. (Bug#8055)
 - Selecting from a view defined as a join caused a server crash if the query cache was enabled. (Bug#8054)
 - Results in the query cache generated from a view were not properly invalidated after `ALTER VIEW` or `DROP VIEW` on that view. (Bug#8050)
 - Creating a table using a name containing a character that is illegal in `character_set_client` resulted in the character being stripped from the name and no error. The character now is considered an error. (Bug#8041)
 - Fixed server crash resulting from certain correlated subqueries with forward references (references to an alias defined later in the outer query). (Bug#8025)
 - Corrected a problem with references to `DUAL` where statements such as `SELECT 1 AS a FROM DUAL` would succeed but statements such as `SELECT 1 AS a FROM DUAL LIMIT 1` would fail. (Bug#8023)
 - Fixed server crash in comparing a nested row expression (for example `row(1, (2, 3))`) with a subquery. (Bug#8022)
 - Fixed a problem with calculation of number of columns in row comparison against subquery. (Bug#8020)
 - `mysqldump` now avoids writing `SET NAMES` to the dump output if the server is older than version 4.1 and would not understand that statement. (Bug#7997)
 - `InnoDB`: Fixed a deadlock without any locking, simple select and update. `InnoDB` now takes an exclusive lock when `INSERT ON DUPLICATE KEY UPDATE` is checking duplicate keys. (Bug#7975)
 - Fixed that a 5.0.3 slave can connect to a master < 3.23.50 without hanging (the reason for the hang is a bug in these quite old masters -- `SELECT @@unknown_var` hangs them -- which was fixed in MySQL 3.23.50). (Bug#7965)
 - Fixed erroneous output resulting from `SELECT DISTINCT` combined with a subquery and `GROUP BY`. (Bug#7946)

- `FOUND_ROWS()` returned an incorrect value after a `SELECT SQL_CALC_FOUND_ROWS DISTINCT` statement that selected constants and included `GROUP BY` and `LIMIT` clauses. (Bug#7945)
- `mysqld_safe` now understands the `--help` option. Previously, it ignored the option and attempted to start the server anyway. (Bug#7931)
- Fixed bug creating user with `GRANT` fails with password but works without, (Bug#7905)
- Fixed a bug where comparing the result of a subquery to a non-existent column caused a server crash on Windows. (Bug#7885)
- Fixed a bug where `ALTER TABLE` improperly would accept an index on a `TIMESTAMP` column that `CREATE TABLE` would reject. (Bug#7884)
- Fixed a bug where MySQL was allowing concurrent updates (inserts, deletes) to a table if binary logging is enabled. Changed to ensure that all updates are executed in a serialized fashion, because they are executed serialized when binlog is replayed. (Bug#7879)
- Ensured that `mysqldump --single-transaction` sets its transaction isolation level to `REPEATABLE READ` before proceeding (otherwise if the MySQL server was configured to run with a default isolation level lower than `REPEATABLE READ` it could give an inconsistent dump). (Bug#7850)
- `mysqlbinlog` forgot to add backquotes around the collation of user variables (causing later parsing problems as `BINARY` is a reserved word). (Bug#7793)
- Fixed a bug in `max_heap_table_size` handling, that resulted in `Table is full` error when the table was still smaller than the limit. (Bug#7791)
- Fixed a bug where the use of `GROUP_CONCAT()` with `HAVING` caused a server crash. (Bug#7769)
- Fixed a bug in `CONV()` function returning unsigned `BIGINT` number (third argument is positive, and return value does not fit in 32 bits). (Bug#7751)
- Fixed a failure of the `IN()` operator to return correct result if all values in the list were constants and some of them were using substring functions, for example, `LEFT()`, `RIGHT()`, or `MID()`. (Bug#7716)
- Fixed that, when encountering a “disk full” or “quota exceeded” write error, `MyISAM` sometimes didn't sleep and retry the write, thus resulting in a corrupted table. (Bug#7714)
- Fixed a crash in `CONVERT_TZ()` function when its second or third argument was from a `const` table (see Section 6.2.1, “Optimizing Queries with `EXPLAIN`”). (Bug#7705)
- The output of the `STATUS (\s)` command in `mysql` had the values for the server and client character sets reversed. (Bug#7571)
- `LEFT OUTER JOIN` between an empty base table and a view on an empty base table caused a server crash. (Bug#7433)
- Ordering by unsigned expression (more complex than a column reference) was treating the value as signed, producing incorrectly sorted results. (Bug#7425)
- `HAVING` was treating unsigned columns as signed. (Bug#7425)
- Fixed a bug that caused server crash if some error occurred during filling of temporary table created for derived table or view handling. (Bug#7413)
- Made the MySQL server accept executing `SHOW CREATE DATABASE` even if the connection has an open transaction or locked tables; refusing it made `mysqldump --single-transaction` sometimes fail to print a complete `CREATE DATABASE` statement for some dumped databases. (Bug#7358)
- Fixed that `--expire-log-days` was not honored if using only transactions. (Bug#7236)
- Some `INFORMATION_SCHEMA` columns that contained timestamp values were of type `VARBINARY`. These were changed to `TIMESTAMP`. (Bug#7217)
- Some `INFORMATION_SCHEMA` columns that contained catalog identifiers were of type `LONGTEXT`. These were changed to `VARCHAR(N)`, where `N` is the appropriate maximum identifier length. (Bug#7215)
- Use of `GROUP_CONCAT()` in the select list when selecting from a view caused a server crash. (Bug#7116)
- An expression that tested a case-insensitive character column against string constants that differed in lettercase could fail because the constants were treated as having a binary collation. (For example, `WHERE city='London' AND city='london'` could fail.) (Bug#7098, Bug#8690)

- **InnoDB**: Fixed a bug no error message for `ALTER` with **InnoDB** and `AUTO_INCREMENT`. **InnoDB** now supports `ALTER TABLE... AUTO_INCREMENT = x` query to set auto increment value for a table. (Bug#7061)
- Fixed a failure of multiple-table updates to replicate properly on slave servers when `--replicate-*-table` options had been specified. (Bug#7011)
- When setting integer system variables to a negative value with `SET VARIABLES`, the value was treated as a positive value modulo 2^{32} . (Bug#6958)
- Use of a view in a correlated subquery that contains `HAVING` but no `GROUP BY` caused a server crash. (Bug#6894)
- Fixed a bug which caused server crash if query containing `CONVERT_TZ()` function with constant arguments was prepared. (Bug#6849)
- Handling by `mysql_list_fields()` of references to stored functions within views was incorrect and could result in a server crash. (Bug#6814)
- A sequence of `BEGIN` (or `SET AUTOCOMMIT=0`), `FLUSH TABLES WITH READ LOCK`, transactional update, `COMMIT`, `FLUSH TABLES WITH READ LOCK` could hang the connection forever and possibly the MySQL server itself. This happened for example when running the `innobackup` script several times. (Bug#6732)
- Prevent adding `CREATE TABLE... SELECT` query to the binary log when the insertion of new records partially failed. (Bug#6682)
- `mysqlbinlog` did not print `SET PSEUDO_THREAD_ID` statements in front of `LOAD DATA INFILE` statements inserting into temporary tables, thus causing potential problems when rolling forward these statements after restoring a backup. (Bug#6671)
- If a **MyISAM** table on Windows had `INDEX DIRECTORY` or `DATA DIRECTORY` table options, `mysqldump` dumped the directory pathnames with single-backslash pathname separators. This would cause syntax errors when importing the dump file. `mysqldump` now changes “\” to “/” in the pathnames on Windows. (Bug#6660)
- `SHOW CREATE TABLE` now reports `ENGINE=MEMORY` rather than `ENGINE=HEAP` for a **MEMORY** table (unless the `MYSQL323` SQL mode is enabled). (Bug#6659)
- Fixed an optimizer bug that caused incorrectly ordered result from a query that used a `FULLTEXT` index to retrieve rows and there was another index that was usable for `ORDER BY`. For such a query, `EXPLAIN` showed `fulltext` join type, but regular (not `FULLTEXT`) index in the `Key` column. (Bug#6635)
- Fixed failure of `CREATE TABLE... LIKE` Windows when the source or destination table was located in a symlinked database directory. (Bug#6607)
- Retrieving from a view defined as a `SELECT` that mixed `UNION ALL` and `UNION DISTINCT` resulted in a different result than retrieving from the original `SELECT`. (Bug#6565)
- Fixed that a slave could crash after replicating many `ANALYZE TABLE`, `OPTIMIZE TABLE`, or `REPAIR TABLE` statements from the master. (Bug#6461, Bug#7658)
- Fixed problems when selecting from a view that had an `EXISTS` or `NOT EXISTS` subquery. Selecting columns by name caused a server crash. With `SELECT *`, a crash did not occur, but columns in outer query were not resolved properly. (Bug#6394)
- Changed semantics of `CREATE/ALTER/DROP DATABASE` statements so that replication of `CREATE DATABASE` is possible when using `--binlog-do-db` and `--binlog-ignore-db`. (Bug#6391)
- Fixed problem in `NO_BACKSLASH_ESCAPES` SQL mode for strings that contained both the string quoting character and backslash. (Bug#6368)
- The `CHAR()` function was not ignoring `NULL` arguments, contrary to the documentation. (Bug#6317)
- Fixed a bug which caused a crash when only the slave I/O thread was stopped and started. (Bug#6148)
- **InnoDB**: Honor the `--tmpdir` startup option when creating temporary files. Previously, **InnoDB** temporary files were always created in the temporary directory of the operating system. On Netware, **InnoDB** will continue to ignore `--tmpdir`. (Bug#5822)
- With `lower_case_table_names` set to 1, `mysqldump` on Windows could write the same table name in different lettercase for different SQL statements. Fixed so that consistent lettercase is used. (Bug#5185)
- DDL statements for views were not being written to the binary log (and thus not subject to replication). (Bug#4838)

- Platform and architecture information in version information produced for `--version` option on Windows was always `Win95/Win98 (i32)`. More accurately determine platform as `Win32` or `Win64` for 32-bit or 64-bit Windows, and architecture as `ia32` for x86, `ia64` for Itanium, and `axp` for Alpha. ([Bug#4445](#))
- Fixed that when using the `RPAD()` function (or any function adding spaces to the right) in a query that had to be resolved by using a temporary table, all resulting strings had rightmost spaces removed (that is, `RPAD()` did not work) ([Bug#4048](#))
- Hostname matching didn't work if a netmask was specified for table-specific privileges. ([Bug#3309](#))
- `mysql_fix_privilege_tables` now fixes that the `mysql` privilege tables can be used in MySQL 4.1. This allows one to easily downgrade to 4.1 or run MySQL 5.0 and 4.1 with the same privilege files for testing purposes.
- Giving `mysqld` a `SIGHUP` caused it to crash.
- Fixed bug in prepared statements with `SUM(DISTINCT...)`.
- `InnoDB`: Use native `tmpfile()` function on Netware. All `InnoDB` temporary files are created under `sys:\tmp`. Previously, `InnoDB` temporary files were never deleted on Netware.
- Fixed a symlink vulnerability in the `mysqlaccess` script. Reported by Javier Fernandez-Sanguino Pena and [Debian Security Audit Team](#). ([CVE-2005-0004](#))
- Fixed some portability issues with overflow in floating point values.
- Prepared statements now gives warnings on prepare.
- Fixed a bug in a combination of `-not` and `trunc*` operators of full-text search. Using more than one truncated negative search term, was causing empty result set.
- Fixed bug in prepared statements with `OUTER JOIN`.

E.1.28. Changes in MySQL 5.0.2 (01 December 2004)

Functionality added or changed:

- Made the MySQL server ignore `SIGHUP` and `SIGQUIT` on Mac OS X 10.3. This is needed because under this OS, the MySQL server receives lots of these signals. ([Bug#2030](#))
- If the server finds that the `user` table has not been upgraded to include the view-related privilege columns, it treats each account as having view privileges that are the same as its `CREATE` privilege.
- A connection doing a rollback now displays "Rolling back" in the `State` column of `SHOW PROCESSLIST`.
- Renamed the `sql_updatable_view_key` system variable to `updatable_views_with_limit`. This variable now can have only two values:
 - `1` or `YES`: Don't issue an error message (warning only) if a `VIEW` without presence of a key in the underlying table is used in queries with a `LIMIT` clause for updating. (This is the default value.)
 - `0` or `NO`: Prohibit update of a `VIEW`, which does not contain a key in the underlying table and the query uses a `LIMIT` clause (usually get from GUI tools).
- Reverted output format of `SHOW TABLES` to old pre-5.0.1 format that did not include a table type column. To get the additional column that lists the table type, use `SHOW FULL TABLES` now.
- `CHECK TABLE` now works for views.
- Modify `DROP USER` so that it drops the account, including all its privileges. Formerly, it removed the account record only for an account that had all privileges revoked.
- `mysqldump --single-transaction --master-data` is now able to take an online (non-blocking) dump of `InnoDB` and report the corresponding binary log coordinates, which makes a backup suitable for point-in-time recovery, roll-forward or replication slave creation. See [Section 7.13](#), "mysqldump — A Database Backup Program".
- **Warning: Incompatible change!** The precedence of `NOT` operator has changed so that expressions such as `NOT a BETWEEN b AND c` are parsed correctly as `NOT (a BETWEEN b AND c)` rather than as `(NOT a) BETWEEN b AND c`. The pre-5.0 higher-precedence behavior can be obtained by enabling the new `HIGH_NOT_PRECEDENCE` SQL mode.
- `0` or `NO`: Prohibit update of a `VIEW`, which does not contain a key in the underlying table and the query uses a `LIMIT` clause

(usually get from GUI tools).

- We now detect too-large floating point numbers during statement parsing and generate an error messages for them.
- New `--auto-increment-increment` and `--auto-increment-offset` startup options. These allow you to set up a server to generate auto-increment values that don't conflict with another server.
- Added the `CREATE USER` and `RENAME USER` statements.
- MySQL now by default checks dates and in strict mode allows only fully correct dates. If you want MySQL to behave as before, you should enable the new `ALLOW_INVALID_DATES` SQL mode.
- Added `NO_AUTO_CREATE_USER` SQL mode to prevent `GRANT` from automatically creating new users if it would otherwise do so, unless a password also is specified.
- MySQL now remembers which columns were declared to have default values. In `STRICT_TRANS_TABLES/STRICT_ALL_TABLES` mode, you now get an error if you do an `INSERT` without specifying all columns that don't have a default value. A side effect of this is that when you do `SHOW CREATE` for a new table, you no longer see a `DEFAULT` value for a column for which you didn't specify a default value.
- **InnoDB:** If you specify the option `innodb_locks_unsafe_for_binlog` in `my.cnf`, InnoDB in an `UPDATE` or a `DELETE` only locks the rows that it updates or deletes. This greatly reduces the probability of deadlocks.
- A `HAVING` clause in a `SELECT` statement now can refer to columns in the `GROUP BY` clause, as required by standard SQL.
- The `SCHEMA` and `SCHEMAS` keywords are now accepted as synonyms for `DATABASE` and `DATABASES`.
- Added several InnoDB status variables. See [Section 5.2.5, “Status Variables”](#).
- Added `STRICT_TRANS_TABLES`, `STRICT_ALL_TABLES`, `NO_ZERO_IN_DATE`, `NO_ZERO_DATE`, `ERROR_FOR_DIVISION_BY_ZERO`, and `TRADITIONAL` SQL modes. The `TRADITIONAL` mode is shorthand for all the preceding modes. When using mode `TRADITIONAL`, MySQL generates an error if you try to insert a wrong value in a column. It does not adjust the value to the closest possible legal value.
- The `mysql_fix_privilege_tables` script now initializes the global `CREATE VIEW` and `SHOW VIEW` privileges in the `user` table to the value of the `CREATE` privilege in that table.
- `1` or `YES`: Don't issue an error message (warning only) if a `VIEW` without presence of a key in the underlying table is used in queries with a `LIMIT` clause for updating. (This is the default value.)
- The compilation flag `DONT_USE_DEFAULT_FIELDS` was removed because you can get the same behavior by setting the `sql_mode` system variable to `STRICT_TRANS_TABLES`.
- **Warning: Incompatible change!** `SHOW STATUS` now shows the session (thread-specific) status variables and `SHOW GLOBAL STATUS` shows the status variables for the whole server.

Before MySQL 5.0.2, `SHOW STATUS` returned global status values. Because the default as of 5.0.2 is to return session values, this is incompatible with previous versions. To issue a `SHOW STATUS` statement that will retrieve global status values for all versions of MySQL, write it like this:

```
SHOW /*!50002 GLOBAL */ STATUS;
```

- `mysqlbinlog` now prints an informative commented line (thread id, timestamp, server id, and so forth) before each `LOAD DATA INFILE`, like it does for other queries; unless `--short-form` is used.
- Two new server system variables were introduced. `auto_increment_increment` and `auto_increment_offset` can be set locally or globally, and are intended for use in controlling the behavior of `AUTO_INCREMENT` columns in master-to-master replication. Note that these variables are not intended to take the place of sequences. See [Section 5.2.3, “System Variables”](#).
- Added `IS [NOT] boolean_value` syntax, where `boolean_value` is `TRUE`, `FALSE`, or `UNKNOWN`.
- Added `--start-datetime`, `--stop-datetime`, `--start-position`, `--stop-position` options to `mysqlbinlog` (makes point-in-time recovery easier).
- Added initial support for rudimentary triggers (the `CREATE TRIGGER` and `DROP TRIGGER` statements).
- Added basic support for read-only server side cursors.
- Implemented the `WITH CHECK OPTION` clause for `CREATE VIEW`.

- Added support for the `INFORMATION_SCHEMA` “information database” that provides database metadata. See [Chapter 21, *The INFORMATION_SCHEMA Database*](#).

Bugs fixed:

- Fixed a bug which prevented `mysqlbinlog` from being able to read from `stdin`, for example, when piping the output from `zcat` to `mysqlbinlog`. ([Bug#7853](#))
- If a connection was interrupted by a network error and did a rollback, the network error code got stored into the `BEGIN` and `ROLLBACK` binary log events; that caused superfluous slave stops. ([Bug#6522](#))
- Fixed problem introduced in 4.0.21 where a connection starting a transaction, doing updates, then `FLUSH TABLES WITH READ LOCK`, then `COMMIT`, would cause replication slaves to stop (complaining about error 1223). Bug surfaced when using the InnoDB `innobackup` script. ([Bug#5949](#))
- If a connection had an open transaction but had done no updates to transactional tables (for example if had just done a `SELECT FOR UPDATE` then executed a non-transactional update, that update automatically committed the transaction (thus releasing InnoDB's row-level locks etc). ([Bug#5714](#))
- Fixed that if the slave SQL thread found a syntax error in a query (which should be rare, as the master parsed it successfully), it stops. ([Bug#5711](#))
- Fixed slave SQL thread so that the `SET COLLATION_SERVER...` statements it replicates don't advance its position (so that if it gets interrupted before the actual update query, it later redoes the `SET`). ([Bug#5705](#))
- `OPTIMIZE TABLE`, `REPAIR TABLE`, and `ANALYZE TABLE` are now replicated without any error code in the binary log. ([Bug#5551](#))
- Fixed that `disable-local-infile` option had no effect if client read it from a configuration file using `mysql_options(...,MYSQL_READ_DEFAULT,...)`. ([Bug#5073](#))
- Fixed that `SET GLOBAL SYNC_BINLOG` did not work on some platforms (Mac OS X). ([Bug#5064](#))
- Fixed that `mysql-test-run` failed on the `rpl_trunc_binlog` test if running test from the installed (the target of 'make install') directory. ([Bug#5050](#))
- Fixed that `mysql_options(...,MYSQL_OPT_LOCAL_INFILE,...)` failed to disable `LOAD DATA LOCAL INFILE`. ([Bug#5038](#))
- Fixed that the counter of an `auto_increment` column was not reset by `TRUNCATE TABLE` if the table was a temporary one. ([Bug#5033](#))
- Fixed that `CREATE TABLE ... TYPE=HEAP ... AS SELECT...` caused replication slave to stop. ([Bug#4971](#))
- Made `FLUSH TABLES WITH READ LOCK` block `COMMIT` if server is running with binary logging; this ensures that the binary log position can be trusted when doing a full backup of tables and the binary log. ([Bug#4953](#))
- Fixed a crash when one connection got `KILLED` while it was doing `START SLAVE`. ([Bug#4827](#))
- Fixed an unlikely deadlock which could happen when using `KILL`. ([Bug#4810](#))
- Fixed that `mysql-test-run` failed on the `grant_cache` test when run as Unix user 'root'. ([Bug#4678](#))
- Fixed that `mysqlbinlog --read-from-remote-server` sometimes couldn't accept two binary log files on the command line. ([Bug#4507](#))
- Fixed that `mysqlbinlog --position --read-from-remote-server` had incorrect `# at` lines. ([Bug#4506](#))
- Fixed that if a write to a `MyISAM` table fails because of a full disk or an exceeded disk quota, it prints a message to the error log every 10 minutes, and waits until disk becomes free. ([Bug#3248](#))

E.1.29. Changes in MySQL 5.0.1 (27 July 2004)

Note

This build passes our test suite and fixes a lot of reported bugs found in the previous 5.0.0 release. However, please be aware that this is not a “standard MySQL build” in the sense that there are still some open critical bugs in our bugs database at <http://bugs.mysql.com/> that affect this release as well. We are actively fixing these and will make a new

release where these are fixed as soon as possible. However, this binary should be a good candidate for testing new MySQL 5.0 features for future products.

Functionality added or changed:

- Fixed `SHOW TABLES` output field name and values according to standard. Field name changed from `Type` to `table_type`, values are `BASE TABLE`, `VIEW` and `ERROR`. (Bug#4603)
- For replication of `MEMORY (HEAP)` tables: Made the master automatically write a `DELETE FROM` statement to its binary log when a `MEMORY` table is opened for the first time since master's startup. This is for the case where the slave has replicated a non-empty `MEMORY` table, then the master is shut down and restarted: the table is now empty on master; the `DELETE FROM` empties it on slave too. Note that even with this fix, between the master's restart and the first use of the table on master, the slave still has out-of-date data in the table. But if you use the `--init-file` option to populate the `MEMORY` table on the master at startup, it ensures that the failing time interval is zero. (Bug#2477)
- Added `Last_query_cost` status variable that reports optimizer cost for last compiled query.
- Changed that when the MySQL server has binary logging disabled (that is, no `--log-bin` option was used), then no transaction binary log cache is allocated for connections. This should save `binlog_cache_size` bytes of memory (32KB by default) for every connection.
- Implemented a new “greedy search” optimizer that can significantly reduce the time spent on query optimization for some many-table joins. (You are affected if not only some particular `SELECT` is slow, but even using `EXPLAIN` for it takes a noticeable amount of time.) Two new system variables, `optimizer_search_depth` and `optimizer_prune_level`, can be used to fine-tune optimizer behavior.
- `OPTIMIZE TABLE` for `InnoDB` tables is now mapped to `ALTER TABLE` instead of `ANALYZE TABLE`. This rebuilds the table, which updates index statistics and frees space in the clustered index.
- When a session having open temporary tables terminates, the statement automatically written to the binary log is now `DROP TEMPORARY TABLE IF EXISTS` instead of `DROP TEMPORARY TABLE`, for more robustness.
- Added support for read-only and updatable views based on a single table or other updatable views. View use requires that you upgrade your grant tables to add the view-related privileges. See [Section 5.5.4, “mysql_fix_privilege_tables — Upgrade MySQL System Tables”](#).
- Added the `sql_updatable_view_key` system variable.
- The MySQL server now returns an error if `SET SQL_LOG_BIN` is issued by a user without the `SUPER` privilege (in previous versions it just silently ignored the statement in this case).
- When a database is dropped, all routines belonging to that database are also dropped.
- Added the `--to-last-log` option to `mysqlbinlog`, for use in conjunction with `--read-from-remote-server`.
- Added the `--innodb-safe-binlog` server option, which adds consistency guarantees between the content of `InnoDB` tables and the binary log. See [Section 5.11.3, “The Binary Log”](#).
- **Warning: Incompatible change!** C API change: `mysql_shutdown()` now requires a second argument. This is a source-level incompatibility that affects how you compile client programs; it does not affect the ability of compiled clients to communicate with older servers. See [Section 23.2.3.65, “mysql_shutdown\(\)”](#).
- `sync_frm` is now a settable global variable (not only a startup option).
- Added the `--replicate-same-server-id` server option.
- Explicit `USE db_name` statements no longer are allowed in a stored procedure.
- Added the `sync_binlog=N` global variable and startup option, which makes the MySQL server synchronize its binary log to disk (`fdatasync()`) after every Nth write to the binary log.
- Killing a `CHECK TABLE` statement does not result in the table being marked as “corrupted” any more; the table remains as if `CHECK TABLE` had not even started. See [Section 12.5.5.3, “KILL Syntax”](#).
- Changed the slave SQL thread to print less useless error messages (no more message duplication; no more messages when an error is skipped because of `slave-skip-errors`).
- When executed from another database, an implicit `USE db_name` is in effect.
- When installing a MySQL server as a Windows service, the installation command can include a `--local-service` option following the service name to cause the server to run using the `LocalService` Windows account that has limited privileges.

This is in addition to the `--defaults-file` option that also can be given following the service name.

- `DROP DATABASE IF EXISTS`, `DROP TABLE IF EXISTS`, single-table `DELETE`, and single-table `UPDATE` now are written to the binary log even if they changed nothing on the master (for example, even if a `DELETE` matched no rows). The old behavior sometimes caused bad surprises in replication setups.
- Procedure names may be qualified, for example, `db.p()`
- Replication and `mysqlbinlog` now have better support for the case that the session character set and collation variables are changed within a given session. See [Section 15.3.1, “Replication Features and Issues”](#).
- A stored procedure is no longer “global.” That is, it now belongs to a specific database:
 - When a database is dropped, all routines belonging to that database are also dropped.
 - Procedure names may be qualified, for example, `db.p()`
 - When executed from another database, an implicit `USE db_name` is in effect.
 - Explicit `USE db_name` statements no longer are allowed in a stored procedure.

See [Chapter 18, *Stored Procedures and Functions*](#).

Bugs fixed:

- Fixed that when a multiple-table `DROP TABLE` failed to drop a table on the master server, the error code was not written to the binary log. ([Bug#4553](#))
- If `CREATE TEMPORARY TABLE t SELECT` failed while loading the data, the temporary table was not dropped. ([Bug#4551](#))
- When the slave SQL thread was replicating a `LOAD DATA INFILE` statement, it didn't show the statement in the output of `SHOW PROCESSLIST`. ([Bug#4326](#))
- `mysql_fix_privilege_tables` didn't correctly handle the argument of its `--password=password_val` option. ([Bug#4240](#))
- Made `DROP DATABASE` honor the value of `lower_case_table_names`. ([Bug#4066](#))
- During the installation process of the server RPM on Linux, `mysqld` was run as the `root` system user, and if you had `-log-bin=somewhere_out_of_var_lib_mysql` it created binary log files owned by `root` in this directory, which remained owned by `root` after the installation. This is now fixed by starting `mysqld` as the `mysql` system user instead. ([Bug#4038](#))
- Fixed potential memory overrun in `mysql_real_connect()` (which required a compromised DNS server and certain operating systems). ([Bug#4017](#))
- Fixed incorrect destruction of expression that led to a server crash on complex `AND/OR` expressions if query was ignored (either by a replication server because of `--replicate-*-table` rules, or by any MySQL server because of a syntax error). ([Bug#3969](#), [Bug#4494](#))
- `mysqlbinlog` didn't escape the string content of user variables, and did not deal well when these variables were in non-ASCII character sets; this is now fixed by always printing the string content of user variables in hexadecimal. The character set and collation of the string is now also printed. ([Bug#3875](#))
- The slave SQL thread refused to replicate `INSERT ... SELECT` if it examined more than 4 billion rows. ([Bug#3871](#))
- If `server-id` was not set using startup options but with `SET GLOBAL`, the replication slave still complained that it was not set. ([Bug#3829](#))
- Fixed a crash of the MySQL slave server when it was built with `--with-debug` and replicating itself. ([Bug#3568](#))
- Multiple-table `DELETE` statements were always replicated by the slave if there were some `--replicate-*-ignore-table` options and no `--replicate-*-do-table` options. ([Bug#3461](#))
- Fixed memory corruption occurring when replicating a `LOAD DATA INFILE` from a master running MySQL version 3.23. ([Bug#3422](#))
- `mysqlbinlog` failed to print a `USE` statement under rare circumstances where the binary log contained a `LOAD DATA IN-`

`FILE` statement. (Bug#3415)

- Fixed a rare error condition that caused the slave SQL thread spuriously to print the message `Binlog has bad magic number` and stop when it was not necessary to do so. (Bug#3401)
- Fixed that in some replication error messages, a very long query caused the rest of the message to be invisible (truncated), by putting the query last in the message. (Bug#3357)
- Fixed `mysqlbinlog --read-from-remote-server` to print the exact positions of events in the "at #" lines. (Bug#3214)
- `mysqlbinlog --read-from-remote-server` read all binary logs following the one that was requested. It now stops at the end of the requested file, the same as it does when reading a local binary log. There is an option `--to-last-log` to get the old behavior. (Bug#3204)
- Strange results with index (x, y) ... `WHERE x=val_1 AND y>=val_2 ORDER BY pk;` (Bug#3155)
- Adding `ORDER BY` to a query that uses a subquery can cause incorrect results. (Bug#3118)
- Changed that when a thread handling `INSERT DELAYED` (also known as a `delayed_insert` thread) is killed, its statements are recorded with an error code of value zero (killing such a thread does not endanger replication, so we thus avoid a superfluous error on the slave). (Bug#3081)
- Changed that when a `DROP TEMPORARY TABLE` statement is automatically written to the binary log when a session ends, the statement is recorded with an error code of value zero (this ensures that killing a `SELECT` on the master does not result in a superfluous error on the slave). (Bug#3063)
- Fixed that when a `Rotate` event is found by the slave SQL thread in the middle of a transaction, the value of `Relay_Log_Pos` in `SHOW SLAVE STATUS` remains correct. (Bug#3017)
- Corrected the master's binary log position that `InnoDB` reports when it is doing a crash recovery on a slave server. (Bug#3015)
- Fixed that `--replicate-wild-*-table` rules apply to `ALTER DATABASE` when the table pattern is `%`, as is the case for `CREATE DATABASE` and `DROP DATABASE`. (Bug#3000)
- Fixed that a statement never triggers a superfluous error on the slave, if it must be excluded given the `--replicate-*` options. The bug was that if the statement had been killed on the master, the slave would stop. (Bug#2983)
- Fixed a segmentation fault when running `LOAD DATA FROM MASTER` after `RESET SLAVE`. (Bug#2922)
- Fixed deadlock when two `START SLAVE` commands were run at the same time. (Bug#2921)
- Changed the column `Seconds_Behind_Master` in `SHOW SLAVE STATUS` to never show a value of -1. (Bug#2826)
- Made clearer the error message that one gets when an update is refused because of the `--read-only` option. (Bug#2757)
- The MySQL server did not report any error if a statement (submitted through `mysql_real_query()` or `mysql_stmt_prepare()`) was terminated by garbage characters. This can happen if you pass a wrong `length` parameter to these functions. The result was that the garbage characters were written into the binary log. (Bug#2703)
- Multiple-table `DELETE` statements were never replicated by the slave if there were any `--replicate-*-table` options. (Bug#2527)
- `SLAVE START` (which is a deprecated syntax, `START SLAVE` should be used instead) could crash the slave. (Bug#2516)
- `ALTER DATABASE` caused the client to hang if the database did not exist. (Bug#2333)
- Replication: If a client connects to a slave server and issues an administrative statement for a table (for example, `OPTIMIZE TABLE` or `REPAIR TABLE`), this could sometimes stop the slave SQL thread. This does not lead to any corruption, but you must use `START SLAVE` to get replication going again. (Bug#1858)
- The `--local-load` option of `mysqlbinlog` now requires an argument.

E.1.30. Changes in MySQL 5.0.0 (22 December 2003: Alpha)

Functionality added or changed:

- Added `TIMESTAMPADD()` and `TIMESTAMPDIFF()` functions.

- The `KILL` statement now takes `CONNECTION` and `QUERY` modifiers. The first is the same as `KILL` with no modifier (it kills a given connection thread). The second kills only the statement currently being executed by the connection.

Important

If you upgrade to MySQL 4.1.1 or higher, it is difficult to downgrade back to 4.0 or 4.1.0! That is because, for earlier versions, `InnoDB` is not aware of multiple tablespaces.

- Added support for `SUM(DISTINCT)`, `MIN(DISTINCT)`, and `MAX(DISTINCT)`.
- Basic support for stored procedures (SQL:2003 style). See [Chapter 18, *Stored Procedures and Functions*](#).
- The output of the `SHOW BINLOG EVENTS` statement has been modified. The `Orig_log_pos` column has been renamed to `End_log_pos` and now represents the offset of the last byte of the event, plus one.
- Implemented Index Merge optimization for `OR` clauses. See [Section 6.2.6, “Index Merge Optimization”](#).
- Easier replication upgrade (5.0.0 masters can read older binary logs and 5.0.0 slaves can read older relay logs). See [Section 15.3.2, “Replication Compatibility Between MySQL Versions”](#), for more details). The format of the binary log and relay log is changed compared to that of MySQL 4.1 and older.
- For user-defined functions (UDFs), the `UDF_ARGS` structure now has `attributes` and `attribute_lengths` members that provide information about the argument names. [Section 26.2.4.3, “UDF Argument Processing”](#).
- Added `WEEK` and `QUARTER` values as `INTERVAL` arguments for the `DATE_ADD()` and `DATE_SUB()` functions.
- The precedence of the `XOR` operator now lies between `OR` and `AND`. Previously, `XOR` had the same precedence as `OR`.
- Added `SELECT INTO list_of_vars`, which can be of mixed (that is, global and local) types. See [Section 18.2.7.3, “SELECT ... INTO Statement”](#).
- New binary log format that enables replication of these session variables: `sql_mode`, `SQL_AUTO_IS_NULL`, `FOREIGN_KEY_CHECKS` (which was replicated since 4.0.14, but here it's done more efficiently and takes less space in the binary logs), `UNIQUE_CHECKS`. Other variables (like character sets, `SQL_SELECT_LIMIT`, ...) will be replicated in upcoming 5.0.x releases.
- `LOAD DATA INFILE` causes an implicit commit.

Important

The behavior of `LOAD DATA INFILE` in this regard was changed again in MySQL 5.0.26. See [Section E.1.2, “Changes in MySQL 5.0.26 \(03 October 2006\)”](#).

E.2. Changes in MySQL Cluster

Starting from 4.1.13 and 5.0.7, all Cluster changes are included in the MySQL Change History, and this manual section is no longer separately maintained.

E.2.1. Changes in MySQL Cluster-5.0.7 (10 June 2005)

Note

Starting with version 5.0.8, changes for MySQL Cluster can be found in the combined MySQL Change History.

Functionality added or changed:

Bugs fixed:

- ([Bug#11019](#)) `mgmapi start backup` in some cases returns wrong backupid
- ([Bug#10190](#)) Backup from cluster with `NoOfReplica=1` is corrupt
- ([Bug#9246](#)) Condition pushdown and left join, wrong result
- ([Bug#10956](#)) More than 7 node restarts with `--initial` caused cluster to fail.
- ([Bug#9945](#)) `ALTER TABLE` caused server crash. (Linux/390)

- ([Bug#9826](#)) ([Bug#10948](#)) Schema change (`DROP TABLE`, `ALTER TABLE`) crashed HPUX and PPC32.
- ([Bug#10711](#)) ([Bug#9363](#)) ([Bug#8918](#)) ([Bug#10058](#)) ([Bug#9025](#)) Cluster would time out and crash after first query; setting DataMemory to more than 2GB prevented cluster from starting; calling `ndb_select_count()` crashed the cluster. (64-bit Unix OSes)

E.2.2. Changes in MySQL Cluster-5.0.6 (26 May 2005)

Functionality added or changed:

- Limit on number of metadata objects (number of tables, indexes and BLOBs) now increased to 20,320

Bugs fixed:

- The server would hang on successive calls to an `INSERT ... ON DUPLICATE KEY UPDATE` query. ([Bug#9725](#))
- ([Bug#10193](#)) Invalid DataDir in config causes ndbd segmentation fault
- ([Bug#10813](#)) Build with SCI Transporter fails
- ([Bug#10831](#)) ndb mgmd LogDestination maxfiles does not rotate logs properly

E.2.3. Changes in MySQL Cluster-5.0.5 (Not released)

Functionality added or changed:

- Decreased IndexMemory Usage
- Parallel key lookup (read-multi-range) for queries like `SELECT * FROM t1 WHERE primary_key IN (1,2,3,4,5,6,7,8,9,10);`

Bugs fixed:

Patches merged from versions 4.1.11 and 4.1.12

- ([Bug#8315](#)) NdbScanFilter cmp method only works for strings of exact word boundary length
- ([Bug#8103](#)) Configuration handling error
- ([Bug#8035](#)) mysqld signal 10 when ndbd is shutdown
- ([Bug#7631](#)) NDB\$EVENT contains unreadable event and table names
- ([Bug#7628](#)) Filtered event types are ignored
- ([Bug#7627](#)) Drop Event operation fails
- ([Bug#7424](#)) create index on datetime fails

E.2.4. Changes in MySQL Cluster-5.0.4 (16 April 2005)

Functionality added or changed:

- Condition pushdown to storage engine now works for update and delete as well

Bugs fixed:

- ([Bug#9675](#)) Auto-increment not working with `INSERT..SELECT` and NDB storage

- ([Bug#9517](#)) Condition pushdown to storage engine does not work for update/delete
- ([Bug#9282](#)) API Node Crashes/Reloads on 'DELETE FROM'
- ([Bug#9280](#)) Memory leak in cluster when dependent sub-queries are used
- ([Bug#8585](#)) `ndb_cache2` fails on aix52

E.2.5. Changes in MySQL Cluster-5.0.3 (23 March 2005: Beta)

Functionality added or changed:

- Condition pushdown to storage engine
- Query cache enabled for cluster

Bugs fixed:

- Patches merged from version 4.1.10

E.2.6. Changes in MySQL Cluster-5.0.1 (27 July 2004)

Functionality added or changed:

- This was the first MySQL Cluster release in the 5.0 series. As nearly all attention was still focused on getting 4.1 stable, it is not recommended to use MySQL 5.0.1 for MySQL Cluster.

Bugs fixed:

- N/A

E.2.7. Changes in MySQL Cluster-4.1.13 (15 July 2005)

Functionality added or changed:

Bugs fixed:

- ([Bug#11132](#)) Connections between data nodes and management nodes were not being closed following shutdown of `ndb_mgmd`.
- ([Bug#11050](#)) `ndb_mgm> show` printed incorrectly after master data node failure.
- ([Bug#10956](#)) More than 7 node restarts with `--initial` caused cluster to fail.
- ([Bug#9826](#)) ([Bug#10948](#)) Schema change (`DROP TABLE, ALTER TABLE`) crashed HP-UX and PPC32.
- ([Bug#9025](#)) Data nodes failed to restart on 64-bit Solaris.
- ([Bug#11166](#)) Insert records were incorrectly applied by `ndb_restore`, thus making restoration from backup inconsistent if the binlog contained inserts.
- ([Bug#8918](#)) ([Bug#9363](#)) ([Bug#10711](#)) ([Bug#10058](#)) ([Bug#9025](#)) Cluster would time out and crash after first query; setting DataMemory to more than 2GB prevented cluster from starting; calling `ndb_select_count()` crashed the cluster. (64-bit Unix OSes)
- ([Bug#10190](#)) When making a backup of a cluster where `NumberOfReplicas` was equal to 1, the backup's metadata was corrupted. (Linux)
- ([Bug#9945](#)) `ALTER TABLE` caused server crash. (Linux/390)
- ([Bug#11133](#)) A delete operation performed as part of a transaction caused an erroneous result.

- ([Bug#10294](#)) Not allowing sufficient parallelism in cluster configuration (for example, `NoOfTransactions` too small) caused `ndb_restore` to fail without generating any error messages.
- ([Bug#11290](#)) Setting `TransactionInactiveTimeout= 0` did not result in an infinite timeout.

E.2.8. Changes in MySQL Cluster-4.1.12 (13 May 2005)

Functionality added or changed:

Bugs fixed:

- ([Bug#10471](#)) Backup can become inconsistent with certain combinations of multiple-row updates
- ([Bug#10287](#)) `ndb_select_all "delimiter"` option non functional
- ([Bug#10142](#)) Unhandled resource shortage in UNIQUE index code
- ([Bug#10029](#)) crash in ordered index scan after db full
- ([Bug#10001](#)) 2 NDB nodes get signal 6 (abort) in DBTC
- ([Bug#9969](#)) 4012 - has misleading error message
- ([Bug#9960](#)) START BACKUP reports failure albeit succeeding
- ([Bug#9924](#)) ABORT BACKUP 1 crashes 4 node cluster
- ([Bug#9892](#)) Index activation file during node recovery
- ([Bug#9891](#)) Crash in DBACC (line 7004) during commit
- ([Bug#9865](#)) SELECT does not function properly
- ([Bug#9839](#)) Column with AUTOINC contains -1 Value on node stop
- ([Bug#9757](#)) Uncompleted node failure after gracefully stopping node
- ([Bug#9749](#)) Transactions causes deadlock in ACC
- ([Bug#9724](#)) Node fails to start: Message: File has already been opened
- ([Bug#9691](#)) UPDATE fails on attempt to update primary key
- ([Bug#9675](#)) Auto-increment not working with INSERT..SELECT and NDB storage
- ([Bug#9318](#)) drop database does not drop ndb tables
- ([Bug#9280](#)) Memory leak in cluster when dependent sub-queries are used
- ([Bug#8928](#)) create table with keys will shutdown the cluster
- Creating a table did not work for a cluster with 6 nodes. ([Bug#8928](#)) Databases with 1, 2, 4, 8, ... (2^n nodes) did not have the problem. After a rolling upgrade, restart each node manually by restarting it with the `--initial` option. Otherwise, use `dump` and `restore` after an upgrade.

E.2.9. Changes in MySQL Cluster-4.1.11 (01 April 2005)

Functionality added or changed:

Bugs fixed:

- ([Bug#9916](#)) `DbaccMain.cpp / DBACC (Line: 4876) / Pointer too large`
- ([Bug#9435](#)) `TIMESTAMP` columns don't update
- ([Bug#9052](#)) Uninitialized data during unique index build, potential cluster crash

- ([Bug#8876](#)) Timeout when committing aborted transaction after node failure
- ([Bug#8786](#)) `ndb_autodiscover`, drop index can fail, wait 2 minutes timeout
- ([Bug#8853](#)) Transaction aborted after long time during node failure (4012)
- ([Bug#8753](#)) Invalid schema object version after dropping index (crash fixed, currently retry required)
- ([Bug#8645](#)) Assertion failure with multiple management servers
- ([Bug#8557](#)) `ndbd` does not get same nodeid on restart
- ([Bug#8556](#)) corrupt `ndb_mgm` show printout for certain configurations
- ([Bug#8167](#)) cluster shared memory and `mysqld` signal usage clash

E.2.10. Changes in MySQL Cluster-4.1.10 (12 February 2005)

Bugs fixed:

- ([Bug#8284](#)) Out of fragment memory in DBACC
- ([Bug#8262](#)) Node crash due to bug in DBLQH
- ([Bug#8208](#)) node restart fails on Aix 5.2
- ([Bug#8167](#)) cluster shared memory and `mysqld` signal usage clash
- ([Bug#8101](#)) unique index and error 4209 while selecting
- ([Bug#8070](#)) ([Bug#7937](#)) ([Bug#6716](#)) various `ndb_restore` core dumps on HP-UX
- ([Bug#8010](#)) 4006 forces MySQL Node Restart
- ([Bug#7928](#)) out of connection objects
- ([Bug#7898](#)) `mysqld` crash with `ndb` (solaris)
- ([Bug#7864](#)) Not possible to have more than 4.5G data memory

E.2.11. Changes in MySQL Cluster-4.1.9 (13 January 2005)

Functionality added or changed:

- New implementation of shared memory transporter.
- Cluster automatically configures shared memory transporter if possible.
- Cluster prioritizes usage of transporters with shared memory and localhost TCP
- Added switches to control the above functions, `ndb-shm` and `ndb-optimized-node-selection`.

Bugs fixed:

- ([Bug#7805](#)) `config.ini` parsing error
- ([Bug#7798](#)) Running range scan after alter table in different thread causes node failure
- ([Bug#7761](#)) Alter table does not autocommit
- ([Bug#7725](#)) Indexed DATETIME Columns Return Random Results
- ([Bug#7660](#)) START BACKUP does not increment BACKUP-ID (Big Endian machines)
- ([Bug#7593](#)) Cannot Create A Large NDB Data Warehouse

- (Bug#7480) Mysqld crash in ha_ndbcluster using Query Browser
- (Bug#7470) shared memory transporter does not connect
- (Bug#7396) Primary Key not working in NDB MySQL Clustered table (solaris)
- (Bug#7379) ndb_restore fails to handle blobs and multiple databases
- (Bug#7346) ndb_restore enters infinite loop
- (Bug#7340) Problem for inserting data into the Text field on utf8
- (Bug#7124) ndb_mgmd is aborted on startup when using SHM connection

E.2.12. Changes in MySQL Cluster-4.1.8 (14 December 2004)

Functionality added or changed:

- Default port for `ndb_mgmd` was changed to 1186 (from 2200) as this port number was officially assigned to MySQL Cluster by IANA.
- New command in `ndb_mgm`, `PURGE STALE SESSIONS`, as a workaround for cases where nodes fail to allocate a node id even if it is free to use.
- New command in `ndb_mgm`, `CONNECT`.
- The `ndb` executables have been changed to make use of the regular MySQL command line option parsing features. See [Section 16.5.5, “Command Options for MySQL Cluster Processes”](#), for notes on changes.
- As bonus of the above you can now specify all command line options in `my.cnf` using the executable names as sections, that is, `[ndbd]`, `[ndb_mgmd]`, `[ndb_mgm]`, `[ndb_restore]`, and so forth.

```
[ndbd]
ndb-connectstring=myhost.domain.com:1234
[ndb_mgm]
ndb-connectstring=myhost.domain.com:1234
```

- Added use of section `[mysql_cluster]` in `my.cnf`. All cluster executables, including `mysqld`, parse this section. For example, this is a convenient place to put `ndb-connectstring` so that it need be specified only once.
- Added cluster log info events on allocation and deallocation of nodeid's.
- Added cluster log info events on connection refuse as a result of version mismatch.
- Extended connectstring syntax to allow for leaving the port number out. For example, `ndb-connectstring|connect-string=myhost1,myhost2,myhost3` is a valid connectstring and connect occurs on default port 1186.
- Clear text `ndb` error messages provided also for error codes that are mapped to corresponding `mysql` error codes, by executing `SHOW WARNINGS` after an error has occurred which relates to the `ndb` storage engine.
- Significant performance improvements done for read performance, especially for blobs.
- Added some variables for performance tuning, `ndb_force_send` and `ndb_use_exact_count`. Do `show variables like 'ndb%';` in `mysql` client for listing. Use `set` command to alter variables.
- Added variables to set some options, `ndb_use_transactions` and `ndb_autoincrement_prefetch_sz`.

Bugs fixed:

- (Bug#7303) `ndb_mgm`: Trying to set `CLUSTERLOG` for a specific node id core dumps
- (Bug#7193) start backup gives false error printout
- (Bug#7153) Cluster nodes don't report error on endianness mismatch
- (Bug#7152) `ndb_mgmd` segmentation fault on incorrect `HostName` in configuration

- (Bug#7104) clusterlog filtering and level setting broken
- (Bug#6995) ndb_recover on varchar fields results in changing case of data
- (Bug#6919) all status only shows 2 nodes on a 8-node cluster
- (Bug#6871) DBD execute failed: Got error 897 'Unknown error code' from ndbcluster
- (Bug#6794) Wrong outcome of update operation of ndb table
- (Bug#6791) Segmentation fault when config.ini is not correctly set
- (Bug#6775) failure in acc when running many mysql clients
- (Bug#6696) ndb_mgm command line options inconsistent with behavior
- (Bug#6684) ndb_restore doesn't give error messages if improper command given
- (Bug#6677) ndb_mgm can crash on "ALL CLUSTERLOG"
- (Bug#6538) Error code returned when select max() on empty table with index
- (Bug#6451) failing create table gives "ghost" tables which are impossible to remove
- (Bug#6435) strange behavior of left join
- (Bug#6426) update with long pk fails
- (Bug#6398) update of primary key fails
- (Bug#6354) mysql does not complain about --ndbcluster option when NDB is not compiled in
- (Bug#6331) INSERT IGNORE .. SELECT breaks subsequent inserts
- (Bug#6288) cluster nodes crash on data import
- (Bug#6031) To drop database you have to execute DROP DATABASE command twice
- (Bug#6020) LOCK TABLE + delete returns error 208
- (Bug#6018) REPLACE does not work for BLOBs + NDB
- (Bug#6016) Strange crash with blobs + different DATABASES
- (Bug#5973) ndb table belonging to different database shows up in show tables
- (Bug#5872) ALTER TABLE with blob from ndb table to myisam fails
- (Bug#5844) Failing mysql-test-run leaves stray NDB processes behind
- (Bug#5824) HELP text messed up in ndb_mgm
- (Bug#5786) Duplicate key error after restore
- (Bug#5785) lock timeout during concurrent update
- (Bug#5782) Unknown error when using LIMIT with ndb table
- (Bug#5756) RESTART node from ndb_mgm fails
- A few more not reported bugs fixed

E.2.13. Changes in MySQL Cluster-4.1.7 (23 October 2004)

Functionality added or changed:

- Optimization 1: Improved performance on index scans. Measured 30% performance increase on query which do large amounts of index scans.
- Optimization 2: Improved performance on primary key lookups. Around double performance for autocommitted primary key

lookups.

- Optimization 3: Improved performance when using blobs by avoiding usage of exclusive locks for blobs.

Bugs fixed:

- A few bugs fixed.

E.2.14. Changes in MySQL Cluster-4.1.6 (10 October 2004)

Functionality added or changed:

- Limited character set support for storage engine NDBCLUSTER:

Char set	Collation
big5	big5_chinese_ci
	big5_bin
binary	binary
euckr	euckr_korean_ci
	euckr_bin
gb2312	gb2312_chinese_ci
	gb2312_bin
gbk	gbk_chinese_ci
	gbk_bin
latin1	latin1_swedish_ci
	latin1_bin
sjis	sjis_japanese_ci
	sjis_bin
tis620	tis620_bin
ucs2	ucs2_general_ci
	ucs2_bin
ujis	ujis_japanese_ci
	ujis_bin
utf8	utf8_general_ci
	utf8_bin

- The SCI Transporter has been brought up-to-date with all changes and now works and has been documented as well.
- Optimizations when several clients to a MySQL Server access ndb tables.
- Added more checks and warnings for erroneous and inappropriate cluster configurations.
- [SHOW TABLES](#) now directly shows ndb tables created on a different MySQL server, that is, without a prior table access.
- Enhanced support for starting MySQL Server independently of ndbd and ndb_mgmd.
- Clear text ndb error messages provided by executing [SHOW WARNINGS](#) after an error has occurred which relates to the ndb storage engine.

Bugs fixed:

- Quite a few bugs fixed.

E.2.15. Changes in MySQL Cluster-4.1.5 (16 September 2004)

Functionality added or changed:

- Many queries in MySQL Cluster are executed as range scans or full table scans. All queries that don't use a unique hash index or the primary hash index use this access method. In a distributed system it is crucial that batching is properly performed.

In previous versions, the batch size was fixed to 16 per data node. In this version it is configurable per MySQL Server. So for queries using lots of large scans it is appropriate to set this parameter rather large and for queries using many small scans only fetching a small amount of records it is appropriate to set it low.

The performance of queries can easily change as much as 40% based on how this variable is set.

In future versions more logic will be implemented for assessing the batch size on a per-query basis. Thus, the semantics of the new configuration variable `ScanBatchSize` are likely to change.

- The fixed size overhead of the `ndbd` process has been greatly decreased. This is also true for the overhead per operation record as well as overhead per table and index.

A number of new configuration variables have been introduced to enable configuration of system buffers. Configuration variables for specifying the numbers of tables, unique hash indexes, and ordered indexes have also been introduced.

New configuration variables: `MaxNoOfOrderedIndexes`, `MaxNoOfUniqueHashIndexes`

Configuration variables no longer used: `MaxNoOfIndexes` (split into the two above).

- In previous versions `ALTER TABLE`, `TRUNCATE TABLE`, and `LOAD DATA` were performed as one big transaction. In this version, all of these statements are automatically separated into several distinct transactions.

This removes the limitation that one could not change very large tables due to the `MaxNoOfConcurrentOperations` parameter.

- MySQL Cluster's online backup feature now backs up indexes so that both data and indexes are restored.
- In previous versions it was not possible to use `NULL` in indexes. This is now possible for all supported index types.
- Much work has been put onto making `AUTO_INCREMENT` features work as for other table handlers. Autoincrements as a partial key is still only supported by `MyISAM`.
- In earlier versions, `mysqld` would crash if the cluster wasn't started with the `--ndbcluster` option. Now `mysqld` handles cluster crashes and starts without crashing.
- The `-i` option for initial startup of `ndbd` has been removed. Initial startup still can be specified by using the `--initial` option. The reason for this is to ensure that it is clear what takes place when using `--initial`: this option completely removes all data from the disk and should only be used at initial start, in certain software upgrade cases, and in some cases as a work-around when nodes cannot be restarted successfully.
- The management client (`ndb_mgm`) now has additional commands and more information is printed for some commands such as `show`.
- In previous versions, the files were called `ndb_0..` when it wasn't possible to allocate a node ID when starting the node. To ensure that files are not so easily overwritten, these files are now named `ndb_pid..`, where `pid` is the process ID assigned by the OS.
- The default parameters have changed for `ndb_mgmd` and `ndbd`. In particular, they are now started as daemons by default. The `-n` option has been removed since it could cause confusion as to its meaning (nstart or nodaemon).
- In the configuration file, you can now use `[NDBD]` as an alias for `[DB]`, `[MYSQLD]` as an alias for `[API]`, and `[NDB_MGMD]` as an alias for `[MGM]`.

Note

In fact, `[NDBD]`, `[MYSQLD]`, and `[NDB_MGMD]` are now the preferred designations, although the older ones will continue to be supported for some time to come in order to maintain backward compatibility.

- Many more checks for consistency in configuration have been introduced to in order to provide quicker feedback on configuration errors.
- In the connect string, it is now possible to use both ";" and "," as the separator between entries. Thus, "nodeid=2,host=localhost:2200" is equivalent to "nodeid=2;host=localhost:2200".

In the configuration file, it is also possible to use “:” or “=” for assignment values. For example, `MaxNoOfOrderedIndexes : 128` and `MaxNoOfOrderedIndexes = 128` are equivalent expressions.

- The configuration variable names are now case insensitive, so `MaxNoOfOrderedIndexes: 128` is equivalent to `MAXNOOFORDEREDINDEXES = 128`.
- It is possible now to set the backup directory separately from the `FileSystemPath` by using the `BackupDir` configuration variable.

Log files and trace files can now be placed in any directory by setting the `DataDir` configuration variable.

`FileSystemPath` is no longer mandatory and defaults to `DataDir`.

- Queries involving tables from different databases are now supported.
- It is now possible to update the primary key.
- The performance of ordered indexes has been greatly improved, particularly the maintenance of indexes on updates, inserts and deletes.

Bugs fixed:

- Quite a few bugs fixed.

E.2.16. Changes in MySQL Cluster-4.1.4 (31 August 2004)

Functionality added or changed:

- The names of the log files and trace files created by the `ndbd` and `ndb_mgmd` processes have changed.
- Support for the many `BLOB` data types was introduced in this version.

Bugs fixed:

- Quite a few bugs were fixed in the 4.1.4 release.

E.2.17. Changes in MySQL Cluster-4.1.3 (28 June 2004)

Functionality added or changed:

- This was the first MySQL Cluster release so all functionality was new.

Bugs fixed:

- Various bugs fixed in the development process leading up to 4.1.3.

E.3. MySQL Connector/ODBC (MyODBC) Change History

E.3.1. Changes in Connector/ODBC 5.1.1 (Not yet released)

Bugs fixed:

- SQL statements are limited to 64KB. ([Bug#30983](#), [Bug#30984](#))

E.3.2. Changes in Connector/ODBC 5.1.0 (10 September 2007)

This release is the first of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is an alpha release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data. Not all of the features planned for the final Connector/ODBC 5.1 release are implemented.

Functionality is based on Connector/ODBC 3.51.20.

Platform specific notes:

- Added support for Unicode functions ([SQLConnectW](#), etc).
- Added support for [SQL_C_WCHAR](#).
- There are no installer packages for Microsoft Windows x64 Edition.

Functionality added or changed:

- Added descriptor support ([SQLGetDescField](#), [SQLGetDescRec](#), etc).

Bugs fixed:

- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

E.3.3. Changes in Connector/ODBC 5.0.12 (Not yet released)

Note

Development on Connector/ODBC 5.0.x has ceased. New features and functionality will be incorporated into Connector/ODBC 5.1. See [Section 24.1.1.2](#), “Connector/ODBC Roadmap”.

Bugs fixed:

- Inserting [NULL](#) values into a [DATETIME](#) column from Access reports an error. ([Bug#27896](#))
- Tables with [TEXT](#) columns would be incorrectly identified, returning an [Unknown SQL type - 65535](#) error. ([Bug#20127](#))

E.3.4. Changes in Connector/ODBC 5.0.11 (31 January 2007)

Functionality added or changed:

- Added support for ODBC v2 statement options using attributes.
- Driver now builds and is partially tested under Linux with the iODBC driver manager.

Bugs fixed:

- Connection string parsing for DSN-less connections could fail to identify some parameters. ([Bug#25316](#))
- Updates of [MEMO](#) or [TEXT](#) columns from within Microsoft Access would fail. ([Bug#25263](#))
- Transaction support has been added and tested. ([Bug#25045](#))
- Internal function, [my_setpos_delete_ignore\(\)](#) could cause a crash. ([Bug#22796](#))

- Fixed occasional mis-handling of the [SQL_NUMERIC_C](#) type.
- Fixed the binding of certain integer types.

E.3.5. Changes in Connector/ODBC 5.0.10 (14 December 2006)

Connector/ODBC 5.0.10 is the sixth BETA release.

Functionality added or changed:

- Significant performance improvement when retrieving large text fields in pieces using [SQLGetData\(\)](#) with a buffer smaller than the whole data. Mainly used in Access when fetching very large text fields. ([Bug#24876](#))
- Added initial unicode support in data and metadata. ([Bug#24837](#))
- Added initial support for removing braces when calling stored procedures and retrieving result sets from procedure calls. ([Bug#24485](#))
- Added loose handling of retrieving some diagnostic data. ([Bug#15782](#))
- Added wide-string type info for [SQLGetTypeInfo\(\)](#).

Bugs fixed:

- Editing DSN no longer crashes ODBC data source administrator. ([Bug#24675](#))
- String query parameters are now escaped correctly. ([Bug#19078](#))

E.3.6. Changes in Connector/ODBC 5.0.9 (22 November 2006)

Connector/ODBC 5.0.9 is the fifth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for column binding as [SQL_NUMERIC_STRUCT](#).
- Added recognition of [SQL_C_SHORT](#) and [SQL_C_TINYINT](#) as C types.

Bugs fixed:

- Fixed wildcard handling of and listing of catalogs and tables in [SQLTables](#).
- Added limit of display size when requested via [SQLColAttribute/SQL_DESC_DISPLAY_SIZE](#).
- Fixed buffer length return for [SQLDriverConnect](#).
- ODBC v2 behaviour in driver now supports ODBC v3 date/time types (since [DriverManager](#) maps them).
- Catch use of [SQL_ATTR_PARAMSET_SIZE](#) and report error until we fully support.
- Fixed statistics to fail if it couldn't be completed.
- Corrected retrieval multiple field types bit and blob/text.
- Fixed [SQLGetData](#) to clear the NULL indicator correctly during multiple calls.

E.3.7. Changes in Connector/ODBC 5.0.8 (17 November 2006)

Connector/ODBC 5.0.8 is the fourth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Also made `SQL_DESC_NAME` only fill in the name if there was a data pointer given, otherwise just the length.
- Fixed display size to be length if max length isn't available.
- Made distinction between `CHAR/BINARY` (and VAR versions).
- Wildcards now support escaped chars and underscore matching (needed to link tables with underscores in access).

Bugs fixed:

- Fixed binding using `SQL_C_LONG`.
- Fixed using wrong pointer for `SQL_MAX_DRIVER_CONNECTIONS` in `SQLGetInfo`.
- Set default return to `SQL_SUCCESS` if nothing is done for `SQLSpecialColumns`.
- Fixed `MDiagnostic` to use correct v2/v3 error codes.
- Allow `SQLDescribeCol` to be called to retrieve the length of the column name, but not the name itself.
- Length now used when handling bind parameter (needed in particular for `SQL_WCHAR`) - this enables updating char data in MS Access.
- Updated retrieval of descriptor fields to use the right pointer types.
- Fixed handling of numeric pointers in `SQLColAttribute`.
- Fixed type returned for `MYSQL_TYPE_LONG` to `SQL_INTEGER` instead of `SQL_TINYINT`.
- Fix size return from `SQLDescribeCol`.
- Fixed string length to chars, not bytes, returned by `SQLGetDiagRec`.

E.3.8. Changes in Connector/ODBC 5.0.7 (08 November 2006)

Connector/ODBC 5.0.7 is the third BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for `SQLStatistics` to `MYODBCShell`.
- Improved trace/log.

Bugs fixed:

- `SQLBindParameter` now handles `SQL_C_DEFAULT`.
- Corrected incorrect column index within `SQLStatistics`. Many more tables can now be linked into MS Access.
- Fixed `SQLDescribeCol` returning column name length in bytes rather than chars.

E.3.9. Changes in Connector/ODBC 5.0.6 (03 November 2006)

Connector/ODBC 5.0.6 is the second BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Bugs fixed:

- You no longer have to have Connector/ODBC 3.51 installed before installing this version.
- You no longer have to have Connector/ODBC 3.51 installed before installing this version.
- Connector/ODBC supports both [User](#) and [System](#) DSNs.
- Connector/ODBC supports both [User](#) and [System](#) DSNs.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).
- Installation is provided in the form of a standard Microsoft System Installer (MSI).

E.3.10. Changes in Connector/ODBC 5.0.5 (17 October 2006)

Connector/ODBC 5.0.5 is the first BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

You no longer have to have Connector/ODBC 3.51 installed before installing this version.

Bugs fixed:

- You no longer have to have Connector/ODBC 3.51 installed before installing this version.

E.3.11. Changes in Connector/ODBC 5.0.3 (Connector/ODBC 5.0 Alpha 3) (20 June 2006)

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release:

- The following ODBC API functions have been added in this release:
 - [SQLBindParameter](#)
 - [SQLBindCol](#)

E.3.12. Changes in Connector/ODBC 5.0.2 (Never released)

Connector/ODBC 5.0.2 was an internal implementation and testing release.

E.3.13. Changes in Connector/ODBC 5.0.1 (Connector/ODBC 5.0 Alpha 2) (05 June 2006)

Features, limitations and notes on this release:

- Connector/ODBC 5.0 is Unicode aware.
- Connector/ODBC is currently limited to basic applications. ADO applications and Microsoft Office are not supported.
- Connector/ODBC must be used with a Driver Manager.
- The following ODBC API functions are implemented:
 - [SQLAllocHandle](#)
 - [SQLCloseCursor](#)
 - [SQLColAttribute](#)

- `SQLColumns`
- `SQLConnect`
- `SQLCopyDesc`
- `SQLDisconnect`
- `SQLExecDirect`
- `SQLExecute`
- `SQLFetch`
- `SQLFreeHandle`
- `SQLFreeStmt`
- `SQLGetConnectAttr`
- `SQLGetData`
- `SQLGetDescField`
- `SQLGetDescRec`
- `SQLGetDiagField`
- `SQLGetDiagRec`
- `SQLGetEnvAttr`
- `SQLGetFunctions`
- `SQLGetStmtAttr`
- `SQLGetTypeInfo`
- `SQLNumResultCols`
- `SQLPrepare`
- `SQLRowcount`
- `SQLTables`

The following ODBC API function are implemented, but not yet support all the available attributes/options:

- `SQLSetConnectAttr`
- `SQLSetDescField`
- `SQLSetDescRec`
- `SQLSetEnvAttr`
- `SQLSetStmtAttr`

E.3.14. Changes in Connector/ODBC 3.51.21 (08 October 2007)

Bugs fixed:

- When using a rowset/cursor and add a new row with a number of fields, subsequent rows with fewer fields will include the original fields from the previous row in the final `INSERT` statement. ([Bug#31246](#))
- Uninitiated memory could be used when C/ODBC internally calls `SQLGetFunctions()`. ([Bug#31055](#))
- The wrong `SQL_DESC_LITERAL_PREFIX` would be returned for date/time types. ([Bug#31009](#))

- The wrong `COLUMN_SIZE` would be returned by `SQLGetTypeInfo` for the `TIME` columns (`SQL_TYPE_TIME`). (Bug#30939)
- Clicking outside the character set selection box when configuring a new DSN could cause the wrong character set to be selected. (Bug#30568)
- Not specifying a user in the DSN dialog would raise a warning even though the parameter is optional. (Bug#30499)
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length - 1). (Bug#29871)
- When using ADO, a column marked as `AUTO_INCREMENT` could incorrectly report that the column allowed `NULL` values. This was due to an issue with `NULLABLE` and `IS_NULLABLE` return values from the call to `SQLColumns()`. (Bug#26108)
- Connector/ODBC would return the wrong error code when the server disconnects the active connection because the configured `wait_timeout` has expired. Previously it would return `HY000`. Connector/ODBC now correctly returns an `SQLSTATE` of `08S01`. (Bug#3456)

E.3.15. Changes in Connector/ODBC 3.51.20 (10 September 2007)

Bugs fixed:

- Using `FLAG_NO_PROMPT` doesn't suppress the dialogs normally handled by `SQLDriverConnect`. (Bug#30840)
- The specified length of the username and authentication parameters to `SQLConnect()` were not being honored. (Bug#30774)
- The wrong column size was returned for binary data. (Bug#30547)
- `SQLGetData()` will now always return `SQL_NO_DATA_FOUND` on second call when no data left, even if requested size is 0. (Bug#30520)
- `SQLGetConnectAttr()` did not reflect the connection state correctly. (Bug#14639)
- Removed checkbox in setup dialog for `FLAG_FIELD_LENGTH` (identified as `Don't Optimize Column Width` within the GUI dialog), which was removed from the driver in 3.51.18.

E.3.16. Changes in Connector/ODBC 3.51.19 (10 August 2007)

Connector/ODBC 3.51.19 fixes a specific issue with the 3.51.18 release. For a list of changes in the 3.51.18 release, see [Section E.3.17, "Changes in Connector/ODBC 3.51.18 \(08 August 2007\)"](#).

Functionality added or changed:

- Because of [Bug#10491](#) in the server, character string results were sometimes incorrectly identified as `SQL_VARBINARY`. Until this server bug is corrected, the driver will identify all variable-length strings as `SQL_VARCHAR`.

E.3.17. Changes in Connector/ODBC 3.51.18 (08 August 2007)

Functionality added or changed:

- When connecting to a specific database when using a DSN, the system tables from the `mysql` database are no longer also available. Previously, tables from the `mysql` database (catalog) were listed as `SYSTEM TABLES` by `SQLTables()` even when a different catalog was being queried. (Bug#28662)
- Installed for Mac OS X has been re-instated. The installer registers the driver at a system (not user) level and makes it possible to create both user and system DSNs using the Connector/ODBC driver. The installer also fixes the situation where the necessary drivers would be installed local to the user, not globally. (Bug#15326, Bug#10444)
- Connector/ODBC now supports batched statements. In order to enable cached statement support you must switch enable the batched statement option (`FLAG_MULTI_STATEMENTS`, 67108864, or `ALLOW MULTIPLE STATEMENTS` within a GUI configuration). Be aware that batched statements create an increased chance of SQL injection attacks and you must ensure that your application protects against this scenario. (Bug#7445)
- The `SQL_ATTR_ROW_BIND_OFFSET_PTR` is now supported for row bind offsets. (Bug#6741)

- The `TRACE` and `TRACEFILE` DSN options have been removed. Use the ODBC driver manager trace options instead.

Bugs fixed:

- When using a table with multiple `TIMESTAMP` columns, the final `TIMESTAMP` column within the table definition would not be updateable. Note that there is still a limitation in MySQL server regarding multiple `TIMESTAMP` columns. (Bug#9927) (Bug#30081)
- Fixed an issue where the `myodbc3i` would update the the user ODBC configuration file (`~/Library/ODBC/odbcinst.ini`) instead of the system `/Library/ODBC/odbcinst.ini`. This was caused because `myodbc3i` was not honouring the `s` and `u` modifiers for the `-d` command line option. (Bug#29964)
- Getting table metadata (through the `SQLColumns()`) would fail, returning a bad table definition to calling applications. (Bug#29888)
- `DATETIME` column types would return `FALSE` in place of `SQL_SUCCESS` when requesting the column type information. (Bug#28657)
- The `SQL_COLUMN_TYPE`, `SQL_COLUMN_DISPLAY` and `SQL_COLUMN_PRECISION` values would be returned incorrectly by `SQLColumns()`, `SQLDescribeCol()` and `SQLColAttribute()` when accessing character columns, especially those generated through `concat()`. The lengths returned should now conform to the ODBC specification. The `FLAG_FIELD_LENGTH` option no longer has any affect on the results returned. (Bug#27862)
- Obtaining the length of a column when using a character set for the connection of `utf8` would result in the length being returned incorrectly. (Bug#19345)
- The `SQLColumns()` function could return incorrect information about `TIMESTAMP` columns, indicating that the field was not nullable. (Bug#14414)
- The `SQLColumns()` function could return incorrect information about `AUTO_INCREMENT` columns, indicating that the field was not nullable. (Bug#14407)
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- `BIT(n)` columns are now treated as `SQL_BIT` data where `n = 1` and binary data where `n > 1`.
- The wrong value from `SQL_DESC_LITERAL_SUFFIX` was returned for binary fields.
- The `SQL_DATETIME_SUB` column in `SQLColumns()` was not correctly set for date and time types.
- The value for `SQL_DESC_FIXED_PREC_SCALE` was not returned correctly for values in MySQL 5.0 and later.
- The wrong value for `SQL_DESC_TYPE` was returned for date and time types.
- `SQLConnect()` and `SQLDriverConnect()` were rewritten to eliminate duplicate code and ensure all options were supported using both connection methods. `SQLDriverConnect()` now only requires the setup library to be present when the call requires it.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- Binary packages as disk images with installers are now available for Mac OS X.
- Binary packages as disk images with installers are now available for Mac OS X.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- Binary packages for Sun Solaris are now available as `PKG` packages.

- The wrong value for `DECIMAL_DIGITS` in `SQLColumns()` was reported for `FLOAT` and `DOUBLE` fields, as well as the wrong value for the scale parameter to `SQLDescribeCol()`, and the `SQL_DESC_SCALE` attribute from `SQLColAttribute()`.
- The `SQL_DATA_TYPE` column in `SQLColumns()` results did not report the correct value for date and time types.

E.3.18. Changes in Connector/ODBC 3.51.17 (14 July 2007)

Functionality added or changed:

- It is now possible to specify a different character set as part of the DSN or connection string. This must be used instead of the `SET NAMES` statement. You can also configure the character set value from the GUI configuration. (Bug#9498, Bug#6667)
- Fixed calling convention ptr and wrong free in `myodbc3i`, and fixed the null terminating (was only one, not two) when writing DSN to string.
- Dis-allow NULL ptr for null indicator when calling `SQLGetData()` if value is null. Now returns `SQL_ERROR` w/state 22002.
- The setup library has been split into its own RPM package, to allow installing the driver itself with no GUI dependencies.

Bugs fixed:

- `myodbc3i` did not correctly format driver info, which could cause the installation to fail. (Bug#29709)
- Connector/ODBC crashed with Crystal Reports due to a rproblem with `SQLProcedures()`. (Bug#28316)
- Fixed a problem where the GUI would crash when configuring or removing a System or User DSN. (Bug#27315)
- Fixed error handling of out-of-memory and bad connections in catalog functions. This might raise errors in code paths that had ignored them in the past. (Bug#26934)
- For a stored procedure that returns multiple result sets, Connector/ODBC returned only the first result set. (Bug#16817)
- Calling `SQLGetDiagField` with `RecNumber 0`, `DiagIdentifier NOT 0` returned `SQL_ERROR`, preventing access to diagnostic header fields. (Bug#16224)
- Added a new DSN option (`FLAG_ZERO_DATE_TO_MIN`) to retrieve `XXXX-00-00` dates as the minimum allowed ODBC date (`XXXX-01-01`). Added another option (`FLAG_MIN_DATE_TO_ZERO`) to mirror this but for bound parameters. `FLAG_MIN_DATE_TO_ZERO` only changes `0000-01-01` to `0000-00-00`. (Bug#13766)
- If there was more than one unique key on a table, the correct fields were not used in handling `SQLSetPos()`. (Bug#10563)
- When inserting a large `BLOB` field, Connector/ODBC would crash due to a memory allocation error. (Bug#10562)
- The driver was using `mysql_odbc_escape_string()`, which does not handle the `NO_BACKSLASH_ESCAPES` SQL mode. Now it uses `mysql_real_escape_string()`, which does. (Bug#9498)
- `SQLColumns()` did not handle many of its parameters correctly, which could lead to incorrect results. The table name argument was not handled as a pattern value, and most arguments were not escaped correctly when they contained non-alphanumeric characters. (Bug#8860)
- There are no binary packages for Microsoft Windows x64 Edition.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Correctly return error if `SQLBindCol` is called with an invalid column.
- Fixed possible crash if `SQLBindCol()` was not called before `SQLSetPos()`.
- The Mac OS X binary packages are only provided as tarballs, there is no installer.

- The binary packages for Sun Solaris are only provided as tarballs, not the PKG format.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- Binary packages as disk images with installers are now available for Mac OS X.
- Binary packages for Sun Solaris are now available as [PKG](#) packages.

E.3.19. Changes in Connector/ODBC 3.51.16 (14 June 2007)

Functionality added or changed:

- Connector/ODBC now supports using SSL for communication. This is not yet exposed in the setup GUI, but must be enabled through configuration files or the DSN. ([Bug#12918](#))

Bugs fixed:

- Calls to `SQLNativeSql()` could cause stack corruption due to an incorrect pointer cast. ([Bug#28758](#))
- Using cursors on results sets with multi-column keys could select the wrong value. ([Bug#28255](#))
- `SQLForeignKeys` does not escape `_` and `%` in the table name arguments. ([Bug#27723](#))
- When using stored procedures, making a `SELECT` or second stored procedure call after an initial stored procedure call, the second statement will fail. ([Bug#27544](#))
- `SQLTables()` did not distinguish tables from views. ([Bug#23031](#))
- Data in `TEXT` columns would fail to be read correctly. ([Bug#16917](#))
- Specifying strings as parameters using the `adBSTR` or `adVarChar` types, (`SQL_WVARCHAR` and `SQL_WLONGVARCHAR`) would be incorrectly quoted. ([Bug#16235](#))
- `SQL_WVARCHAR` and `SQL_WLONGVARCHAR` parameters were not properly quoted and escaped. ([Bug#16235](#))
- Using `BETWEEN` with date values, the wrong results could be returned. ([Bug#15773](#))
- When using the `Don't Cache Results` (option value `1048576`) with Microsoft Access, the connection will fail using DAO/VisualBasic. ([Bug#4657](#))
- Return values from `SQLTables()` may be truncated. (Bugs #22797)

E.3.20. Changes in Connector/ODBC 3.51.15 (7 May 2007)

Bugs fixed:

- Connector/ODBC would incorrectly claim to support `SQLProcedureColumns` (by returning true when queried about `SQL-PROCEDURECOLUMNS` with `SQLGetFunctions`), but this functionality is not supported. ([Bug#27591](#))
- An incorrect transaction isolation level may not be returned when accessing the connection attributes. ([Bug#27589](#))
- Adding a new DSN with the `myodbc3i` utility under AIX would fail. ([Bug#27220](#))
- When inserting data using bulk statements (through `SQLBulkOperations`), the indicators for all rows within the insert would not be updated correctly. ([Bug#24306](#))
- Using `SQLProcedures` does not return the database name within the returned resultset. ([Bug#23033](#))
- The `SQLTransact()` function did not support an empty connection handle. ([Bug#21588](#))
- Using `SQLDriverConnect` instead of `SQLConnect` could cause later operations to fail. ([Bug#7912](#))
- When using blobs and parameter replacement in a statement with `WHERE CURSOR OF`, the SQL is truncated. ([Bug#5853](#))

- Connector/ODBC would return too many foreign key results when accessing tables with similar names. ([Bug#4518](#))

-

E.3.21. Changes in Connector/ODBC 3.51.14 (08 March 2007)

Functionality added or changed:

- Use of `SQL_ATTR_CONNECTION_TIMEOUT` on the server has now been disabled. If you attempt to set this attribute on your connection the `SQL_SUCCESS_WITH_INFO` will be returned, with an error number/string of `HYC00: Optional feature not supported`. ([Bug#19823](#))
- Added auto is null option to Connector/ODBC option parameters. ([Bug#10910](#))
- Added auto-reconnect option to Connector/ODBC option parameters.
- Added support for the `HENV` handlers in `SQLEndTran()`.

Bugs fixed:

- On 64-bit systems, some types would be incorrectly returned. ([Bug#26024](#))
- When retrieving `TIME` columns, C/ODBC would incorrectly interpret the type of the string and could interpret it as a `DATE` type instead. ([Bug#25846](#))
- Connector/ODBC may insert the wrong parameter values when using prepared statements under 64-bit Linux. ([Bug#22446](#))
- Using Connector/ODBC, with `SQLBindCol` and binding the length to the return value from `SQL_LEN_DATA_AT_EXEC` fails with a memory allocation error. ([Bug#20547](#))
- Using `DataAdapter`, Connector/ODBC may continually consume memory when reading the same records within a loop (Windows Server 2003 SP1/SP2 only). ([Bug#20459](#))
- When retrieving data from columns that have been compressed using `COMPRESS()`, the retrieved data would be truncated to 8KB. ([Bug#20208](#))
- The ODBC driver name and version number were incorrectly reported by the driver. ([Bug#19740](#))
- A string format exception would be raised when using iODBC, Connector/ODBC and the embedded MySQL server. ([Bug#16535](#))
- The `SQLDriverConnect()` ODBC method did not work with recent Connector/ODBC releases. ([Bug#12393](#))

E.3.22. Changes in Connector/ODBC 3.51.13 (Never released)

Connector/ODBC 3.51.13 was an internal implementation and testing release.

E.3.23. Changes in Connector/ODBC 3.51.12 (11 February 2005)

Functionality added or changed:

- N/A

Bugs fixed:

- Using stored procedures with ADO, where the `CommandType` has been set correctly to `adCmdStoredProc`, calls to stored procedures would fail. ([Bug#15635](#))
- File DSNs could not be saved. ([Bug#12019](#))
- `SQLColumns()` returned no information for tables that had a column named using a reserved word. ([Bug#9539](#))

E.3.24. Changes in Connector/ODBC 3.51.11 (28 January 2005)

Bugs fixed:

- `mysql_list_dbcolumns()` and `insert_fields()` were retrieving all rows from a table. Fixed the queries generated by these functions to return no rows. (Bug#8198)
- `SQLGetTypeInfo()` returned `tinyblob` for `SQL_VARBINARY` and nothing for `SQL_BINARY`. Fixed to return `varbinary` for `SQL_VARBINARY`, `binary` for `SQL_BINARY`, and `longblob` for `SQL_LONGVARBINARY`. (Bug#8138)

E.4. Connector/NET Change History

E.4.1. Changes in MySQL Connector/NET Version 5.1.3 (21 September 2007)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. (Bug#30233)
- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug#30204)
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. (Bug#30077)
- The Saudi Hijri calendar was not supported. (Bug#29931)
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. (Bug#29526)
- Connecting to a MySQL server earlier than version 4.1 would raise a `NullException`. (Bug#29476)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug#29409)
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. (Bug#29312)
- An exception would be thrown when using the Manage Role functionality within the web administrator to assign a role to a user. (Bug#29236)
- Using the membership/role providers when `validationKey` or `decryptionKey` parameters are set to `AutoGenerate`, an exception would be raised when accessing the corresponding values. (Bug#29235)
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. (Bug#29124)
- Using the same connection string multiple times would result in `Database=dbname` appearing multiple times in the resulting string. (Bug#29123)
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that uses the `SELECT` statement would terminate the query/TableAdapter wizard. (Bug#29098)
- Using `TransactionScope` would cause an `InvalidOperationException`. (Bug#28709)

E.4.2. Changes in MySQL Connector/NET Version 5.1.2 (18 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- Log messages would be truncated to 300 bytes. (Bug#28706)

- Creating a user would fail due to the application name being set incorrectly. ([Bug#28648](#))
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that used a `UPDATE`, `INSERT` or `DELETE` statement would terminate the query/TableAdapter wizard. ([Bug#28536](#))
- *Visual Studio Plugin*: Query Builder would fail to show `TINYTEXT` columns, and any columns listed after a `TINYTEXT` column correctly. ([Bug#28437](#))
- Accessing the results from a large query when using data compression in the connection would fail to return all the data. ([Bug#28204](#))
- *Visual Studio Plugin*: Update commands would not be generated correctly when using the TableAdapter wizard. ([Bug#26347](#))

E.4.3. Changes in MySQL Connector/NET Version 5.1.1 (23 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. ([Bug#28448](#))
- Installation of the Connector/NET on Windows would fail if VisualStudio had not already been installed. ([Bug#28260](#))
- Connector/NET would look for the wrong table when executing `User.IsRole()`. ([Bug#28251](#))
- Building a connection string within a tight loop would show slow performance. ([Bug#28167](#))
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySQLCommandBuilder` to obtain the parameter information. ([Bug#27679](#))
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. ([Bug#27668](#))
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in an exception. ([Bug#23342](#))
- Fixed password property on `MySQLConnectionStringBuilder` to use `PasswordPropertyText` attribute. This causes dots to show instead of actual password text.

E.4.4. Changes in MySQL Connector/NET Version 5.1.0 (01 May 2007)

Functionality added or changed:

- Now compiles for .NET CF 2.0.
- Rewrote stored procedure parsing code using a new SQL tokenizer. Really nasty procedures including nested comments are now supported.
- `GetSchema` will now report objects relative to the currently selected database. What this means is that passing in null as a database restriction will report objects on the currently selected database only.
- Added Membership and Role provider contributed by Sean Wright (thanks!).

E.4.5. Changes in MySQL Connector/NET Version 5.0.8 (21 August 2007)

Note

This version introduces a new installer technology.

Bugs fixed:

- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. (Bug #[Bug#30233](#))
- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug #[Bug#30204](#))

- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. (Bug #Bug#30077)
- Fixed bug where Connector/Net was hand building some date time patterns rather than using the patterns provided under `CultureInfo`. This caused problems with some calendars that do not support the same ranges as Gregorian.. (Bug#29931)
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. (Bug #Bug#29526)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug #Bug#29409)
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. (Bug #Bug#29312)
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. (Bug #Bug#29124)
- Using the same connection string multiple times would result in `Database=dbname` appearing multiple times in the resulting string. (Bug #Bug#29123)
- Log messages would be truncated to 300 bytes. (Bug #Bug#28706)
- Accessing the results from a large query when using data compression in the connection will fail to return all the data. (Bug#28204)
- Fixed problem where `MySqlConnection.BeginTransaction` checked the drivers status var before checking if the connection was open. The result was that the driver could report an invalid condition on a previously opened connection.
- Fixed problem where we were not closing prepared statement handles when commands are disposed. This could lead to using up all prepared statement handles on the server.
- Fixed the database schema collection so that it works on servers that are not properly respecting the `lower_case_table_names` setting.
- Fixed problem where any attempt to not read all the records returned from a select where each row of the select is greater than 1024 bytes would hang the driver.
- Fixed problem where a command timing out just after it actually finished would cause an exception to be thrown on the command timeout thread which would then be seen as an unhandled exception.
- Fixed some serious issues with command timeout and cancel that could present as exceptions about thread ownership. The issue was that not all queries cancel the same. Some produce resultsets while others don't. `ExecuteReader` had to be changed to check for this.

E.4.6. Changes in MySQL Connector/NET Version 5.0.7 (18 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. (Bug #Bug#28448)
- Building a connection string within a tight loop would show slow performance. (Bug #Bug#28167)
- Using logging (with the `logging=true` parameter to the connection string) would not generate a log file. (Bug#27765)
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. (Bug #Bug#27679)
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. (Bug #Bug#27668)
- If you close an open connection with an active transaction, the transaction is not automatically rolled back. (Bug#27289)
- When cloning an open `MySqlClient.MySqlConnection` with the `Persist Security Info=False` option set, the cloned connection is not usable because the security information has not been cloned. (Bug#27269)
- Enlisting a null transaction would affect the current connection object, such that further enlistment operations to the transaction

are not possible. ([Bug#26754](#))

- Attempting to change the the `Connection Protocol` property within a `PropertyGrid` control would raise an exception. ([Bug#26472](#))
- The `charset` property would not be identified during a connection (also affected Visual Studio Plugin). ([Bug#26147](#), [Bug#27240](#))
- The `CreateFormat` column of the `DataTypes` collection did not contain a format specification for creating a new column type. ([Bug#25947](#))
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in an exception. ([Bug#23342](#))

E.4.7. Changes in MySQL Connector/NET Version 5.0.6 (22 March 2007)

Bugs fixed:

- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. ([Bug#27253](#))
- `DESCRIBE` SQL command returns byte arrays rather than data on MySQL versions older than 4.1.15. ([Bug#27221](#))
- `cmd.Parameters.RemoveAt("Id")` will cause an error if the last item is requested. ([Bug#27187](#))
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. ([Bug#27135](#))
- Exception thrown when using large values in `UInt64` parameters. ([Bug#27093](#))
- MySQL Visual Studio Plugin 1.1.2 does not work with Connector/Net 5.0.5. ([Bug#26960](#))

E.4.8. Changes in MySQL Connector/NET Version 5.0.5 (07 March 2007)

Functionality added or changed:

- Reverted behavior that required parameter names to start with the parameter marker. We apologize for this back and forth but we mistakenly changed the behavior to not match what `SqlClient` supports. We now support using either syntax for adding parameters however we also respond exactly like `SqlClient` in that if you ask for the index of a parameter using a syntax different from when you added the parameter, the result will be -1.
- Assembly now properly appears in the Visual Studio 2005 Add/Remove Reference dialog.
- Fixed problem that prevented use of `SchemaOnly` or `SingleRow` command behaviors with stored procedures or prepared statements.
- Added `MySqlParameterCollection.AddWithValue` and marked the `Add(name, value)` method as obsolete.
- Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- Fixed problem with parameter name hashing where the hashes were not getting updated when parameters were removed from the collection.
- Fixed problem with calling stored functions when a return parameter was not given.
- Added `Use Procedure Bodies` connection string option to allow calling procedures without using procedure metadata.

Bugs fixed:

- `MySqlConnection.GetSchema` fails with `NullReferenceException` for Foreign Keys. ([Bug#26660](#))
- Connector/NET would fail to install under Windows Vista. ([Bug#26430](#))
- Opening a connection would be slow due to hostname lookup. ([Bug#26152](#))
- Incorrect values/formats would be applied when the `OldSyntax` connection string option was used. ([Bug#25950](#))

- Registry would be incorrectly populated with installation locations. ([Bug#25928](#))
- Times with negative values would be returned incorrectly. ([Bug#25912](#))
- Returned data types of a `DataTypes` collection do not contain the right correct CLR Datatype. ([Bug#25907](#))
- `GetSchema` and `DataTypes` would throw an exception due to an incorrect table name. ([Bug#25906](#))
- `MySQLConnection` throws an exception when connecting to MySQL v4.1.7. ([Bug#25726](#))
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. ([Bug#25651](#))
- When closing and then re-opening a connection to a database, the character set specification is lost. ([Bug#25614](#))
- Filling a table schema through a stored procedure triggers a runtime error. ([Bug#25609](#))
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, datatype. ([Bug#25605](#))
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. ([Bug#25603](#))
- The `UpdateRowSource.FirstReturnedRecord` method does not work. ([Bug#25569](#))
- When connecting to a MySQL Server earlier than version 4.1, the connection would hang when reading data. ([Bug#25458](#))
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. ([Bug#25443](#))
- When a `MySQLConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. ([Bug#24957](#))
- When connecting to a server, the return code from the connection could be zero, even though the hostname was incorrect. ([Bug#24802](#))
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySQLPool.GetConnection`. ([Bug#24373](#))
- Connector/NET would not compile properly when used with Mono 1.2. ([Bug#24263](#))
- Applications would crash when calling with `CommandType` set to `StoredProcedure`.

E.4.9. Changes in MySQL Connector/NET Version 5.0.4 (Not released)

This is a new Beta development release, fixing recently discovered bugs.

E.4.10. Changes in MySQL Connector/NET Version 5.0.3 (05 January 2007)

Functionality added or changed:

- Usage Advisor has been implemented. The Usage Advisor checks your queries and will report if you are using the connection inefficiently.
- PerfMon hooks have been added to monitor the stored procedure cache hits and misses.
- The `MySQLCommand` object now supports asynchronous query methods. This is implemented using the `BeginExecuteNonQuery` and `EndExecuteNonQuery` methods.
- Metadata from stored procedures and stored function execution are cached.
- The `CommandBuilder.DeriveParameters` function has been updated to the procedure cache.
- The `ViewColumns.GetSchema` collection has been updated.
- Improved speed and performance by re-architecting certain sections of the code.
- Support for the embedded server and client library have been removed from this release. Support will be added back to a later release.
- The `ShapZipLib` library has been replaced with the deflate support provided within .NET 2.0.
- SSL support has been updated.

Bugs fixed:

- Additional text added to error message ([Bug#25178](#))
- An exception would be raised, or the process would hang, if `SELECT` privileges on a database were not granted and a stored procedure was used. ([Bug#25033](#))
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. ([Bug#25013](#))
- Using `Driver.IsTooOld()` would return the wrong value. ([Bug#24661](#))
- When using a `DBNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DBNull.Value`. ([Bug#24565](#))
- Stored procedure executions are not thread safe. ([Bug#23905](#))
- Deleting a connection to a disconnected server when using the Visual Studio Plugin would cause an assertion failure. ([Bug#23687](#))
- Nested transactions (which are unsupported) do not raise an error or warning. ([Bug#22400](#))

E.4.11. Changes in MySQL Connector/NET Version 5.0.2 (06 November 2006)

Functionality added or changed:

- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string properties:

```
ignore_prepare=false
```

The default value of this property is true.

Bugs fixed:

- One system where IPv6 was enabled, Connector/NET would incorrectly resolve hostnames. ([Bug#23758](#))
- Column names with accented characters were not parsed properly causing malformed column names in result sets. ([Bug#23657](#))
- An exception would be thrown when calling `GetSchemaTable` and `fields` was null. ([Bug#23538](#))
- A `System.FormatException` exception would be raised when invoking a stored procedure with an `ENUM` input parameter. ([Bug#23268](#))
- During installation, an antivirus error message would be raised (indicating a malicious script problem). ([Bug#23245](#))
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/NET 5.0.2 must be installed. ([Bug#23071](#))
- Using Windows Vista (RC2) as a non-privileged user would raise a `Registry key 'Global' access denied`. ([Bug#22882](#))
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. ([Bug#18186](#))

- Connector/NET did not work as a data source for the `SqlDataSource` object used by ASP.NET 2.0. ([Bug#16126](#))

E.4.12. Changes in MySQL Connector/NET Version 5.0.1 (01 October 2006)

Bugs fixed:

- Connector/NET on a Turkish operating system, may fail to execute certain SQL statements correctly. ([Bug#22452](#))
- Starting a transaction on a connection created by `MySql.Data.MySqlClient.MySqlClientFactory`, using `BeginTransaction` without specifying an isolation level, causes the SQL statement to fail with a syntax error. ([Bug#22042](#))
- The `MySqlException` class is now derived from the `DbException` class. ([Bug#21874](#))
- The `#` would not be accepted within column/table names, even though it was valid. ([Bug#21521](#))
- You can now install the Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. ([Bug#19994](#))
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a Connector/Net exception. ([Bug#18391](#))
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. ([Bug#11991](#))
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). ([Bug#9619](#))
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first.` ([Bug#7248](#))
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

E.4.13. Changes in MySQL Connector/NET Version 5.0.0 (08 August 2006)

Functionality added or changed:

- Replaced use of `ICSharpCode` with .NET 2.0 internal deflate support.
- Refactored test suite to test all protocols in a single pass.
- Added usage advisor warnings for requesting column values by the wrong type.
- Reimplemented `PacketReader/PacketWriter` support into `MySqlStream` class.
- Reworked connection string classes to be simpler and faster.
- Added procedure metadata caching.
- Added internal implementation of SHA1 so we don't have to distribute the OpenNetCF on mobile devices.
- Implemented `MySqlClientFactory` class.
- Added perfmon hooks for stored procedure cache hits and misses.
- Implemented classes and interfaces for ADO.Net 2.0 support.
- Added Async query methods.
- Implemented Usage Advisor.
- Completely refactored how column values are handled to avoid boxing in some cases.
- Implemented `MySqlConnectionBuilder` class.

Bugs fixed:

- `CommandText`: Question mark in comment line is being parsed as a parameter. ([Bug#6214](#))

E.4.14. Changes in MySQL Connector/NET Version 1.0.11 (Not yet released)

Bugs fixed:

- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. (Bug #Bug [Bug#30233](#))

E.4.15. Changes in MySQL Connector/NET Version 1.0.10 (24 August 2007)

Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug #Bug [Bug#30204](#))
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug #Bug [Bug#29409](#))
- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. (Bug #Bug [Bug#27253](#))
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. (Bug #Bug [Bug#27135](#))
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, datatype. (Bug #Bug [Bug#25605](#))
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. (Bug #Bug [Bug#25603](#))
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug #Bug [Bug#24957](#))
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlConnection.GetConnection`. (Bug #Bug [Bug#24373](#))

E.4.16. Changes in MySQL Connector/NET Version 1.0.9 (02 February 2007)

Functionality added or changed:

- The `ICSharpCode ZipLib` is no longer used by the Connector, and is no longer distributed with it.
- **Important change:** Binaries for .NET 1.0 are no longer supplied with this release. If you need support for .NET 1.0, you must build from source.
- Improved `CommandBuilder.DeriveParameters` to first try and use the procedure cache before querying for the stored procedure metadata. Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string properties:

```
ignore prepare=false
```

The default value of this property is true.

Bugs fixed:

- Times with negative values would be returned incorrectly. (Bug #Bug#25912)
- `MySQLConnection` throws a `NullReferenceException` and `ArgumentNullException` when connecting to MySQL v4.1.7. (Bug#25726)
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. (Bug #Bug#25651)
- When closing and then re-opening a connection to a database, the character set specification is lost. (Bug #Bug#25614)
- Trying to fill a table schema through a stored procedure triggers a runtime error. (Bug#25609)
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. (Bug #Bug#25443)
- Additional text added to error message. (Bug#25178)
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. (Bug #Bug#25013)
- When connecting to a server, the return code from the connection could be zero, even though the hostname was incorrect. (Bug #Bug#24802)
- Using `Driver.IsTooOld()` would return the wrong value. (Bug #Bug#24661)
- When using a `DBNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DBNull.Value`. (Bug #Bug#24565)
- Stored procedure executions are not thread safe. (Bug #Bug#23905)
- The `CommandBuilder` would mistakenly add insert parameters for a table column with auto incrementation enabled. (Bug#23862)
- One system where IPv6 was enabled, Connector/NET would incorrectly resolve hostnames. (Bug #Bug#23758)
- Nested transactions do not raise an error or warning. (Bug#22400)
- An `System.OverflowException` would be raised when accessing a varchar field over 255 bytes. Bug (#23749)
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug 18186)

E.4.17. Changes in MySQL Connector/NET Version 1.0.8 (20 October 2006)

Functionality added or changed:

- Stored procedures are now cached.
- The method for retrieving stored procedured metadata has been changed so that users without `SELECT` privileges on the `mysql.proc` table can use a stored procedure.

Bugs fixed:

- Connector/NET on a Turkish operating system, may fail to execute certain SQL statements correctly. (Bug #Bug#22452)
- The `#` would not be accepted within column/table names, even though it was valid. (Bug #Bug#21521)
- Calling `Close` on a connection after calling a stored procedure would trigger a `NullReferenceException`. (Bug#20581)
- You can now install the Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug #Bug#19994)
- The `DiscoverParameters` function would fail when a stored procedure used a `NUMERIC` parameter type. (Bug#19515)
- When running a query that included a date comparison, a `DateReader` error would be raised. (Bug#19481)

- `IDataRecord.GetString` would raise `NullPointerException` for null values in returned rows. Method now throws `SqlNullValueException`. (Bug#19294)
- Parameter substitution in queries where the order of parameters and table fields did not match would substitute incorrect values. (Bug#19261)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a Connector/Net exception. (Bug #Bug#18391)
- An exception would be raised when using an output parameter to a `System.String` value. (Bug#17814)
- CHAR type added to `MySqlDbType`. (Bug#17749)
- A `SELECT` query on a table with a date with a value of '0000-00-00' would hang the application. (Bug#17736)
- The `CommandBuilder` ignored `Unsigned` flag at `Parameter` creation. (Bug#17375)
- When working with multiple threads, character set initialization would generate errors. (Bug#17106)
- When using an unsigned 64-bit integer in a stored procedure, the unsigned bit would be lost stored. (Bug#16934)
- `DataReader` would show the value of the previous row (or last row with non-null data) if the current row contained a `datetime` field with a null value. (Bug#16884)
- Unsigned data types were not properly supported. (Bug#16788)
- The connection string parser did not allow single or double quotes in the password. (Bug#16659)
- The `MySqlDateTime` class did not contain constructors. (Bug#15112)
- Called `MySqlCommandBuilder.DeriveParameters` for a stored procedure that has no paramers would cause an application crash. (Bug#15077)
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. (Bug #Bug#11991)
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). (Bug #Bug#9619)
- When using `MySqlDataAdapter`, connections to a MySQL server may remain open and active, even though the use of the connection has been completed and the data received. (Bug#8131)
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. (Bug #Bug#7248)
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

E.4.18. Changes in MySQL Connector/NET Version 1.0.7 (21 November 2005)

Bugs fixed:

- Unsigned `tinyint` (NET byte) would lead to and incorrectly determined parameter type from the parameter value. (Bug#18570)
- A `#42000Query was empty` exception occurred when executing a query built with `MySqlCommandBuilder`, if the query string ended with a semicolon. (Bug#14631)
- The parameter collection object's `Add()` method added parameters to the list without first checking to see whether they already existed. Now it updates the value of the existing parameter object if it exists. (Bug#13927)
- Added support for the `cp932` character set. (Bug#13806)
- Calling a stored procedure where a parameter contained special characters (such as '@') would produce an exception. Note that `ANSI_QUOTES` had to be enabled to make this possible. (Bug#13753)
- The `Ping()` method did not update the `State` property of the `Connection` object. (Bug#13658)
- Implemented the `MySqlCommandBuilder.DeriveParameters` method that is used to discover the parameters for a stored procedure. (Bug#13632)

- A statement that contained multiple references to the same parameter could not be prepared. ([Bug#13541](#))

E.4.19. Changes in MySQL Connector/NET Version 1.0.6 (03 October 2005)

Bugs fixed:

- Connector/NET 1.0.5 could not connect on Mono. ([Bug#13345](#))
- Serializing a parameter failed if the first value passed in was `NULL`. ([Bug#13276](#))
- Field names that contained the following characters caused errors: `() % < > /` ([Bug#13036](#))
- The `nant` build sequence had problems. ([Bug#12978](#))
- The Connector/NET 1.0.5 installer would not install alongside Connector/NET 1.0.4. ([Bug#12835](#))

E.4.20. Changes in MySQL Connector/NET Version 1.0.5 (29 August 2005)

Bugs fixed:

- Connector/NET could not connect to MySQL 4.1.14. ([Bug#12771](#))
- With multiple hosts in the connection string, Connector/NET would not connect to the last host in the list. ([Bug#12628](#))
- The `ConnectionString` property could not be set when a `MySqlConnection` object was added with the designer. ([Bug#12551](#), [Bug#8724](#))
- The `cp1250` character set was not supported. ([Bug#11621](#))
- A call to a stored procedure caused an exception if the stored procedure had no parameters. ([Bug#11542](#))
- Certain malformed queries would trigger a `Connection must be valid and open` error message. ([Bug#11490](#))
- Trying to use a stored procedure when `Connection.Database` was not populated generated an exception. ([Bug#11450](#))
- Connector/NET interpreted the new decimal data type as a byte array. ([Bug#11294](#))
- Added support to call a stored function from Connector/NET. ([Bug#10644](#))
- Connection could fail when .NET thread pool had no available worker threads. ([Bug#10637](#))
- Calling `MySqlConnection.clone` when a connection string had not yet been set on the original connection would generate an error. ([Bug#10281](#))
- Decimal parameters caused syntax errors. ([Bug#10152](#), [Bug#11550](#), [Bug#10486](#))
- Parameters were not recognized when they were separated by linefeeds. ([Bug#9722](#))
- The `MySqlCommandBuilder` class could not handle queries that referenced tables in a database other than the default database. ([Bug#8382](#))
- Trying to read a `TIMESTAMP` column generated an exception. ([Bug#7951](#))
- Connector/NET could not work properly with certain regional settings. (WL#8228)

E.4.21. Changes in MySQL Connector/NET Version 1.0.4 (20 January 2005)

Bugs fixed:

- `MySqlReader.GetInt32` throws exception if column is unsigned. ([Bug#7755](#))
- Quote character `\222` not quoted in `EscapeString`. ([Bug#7724](#))
- `GetBytes` is working no more. ([Bug#7704](#))

- `MySqlDataReader.GetString(index)` returns non-Null value when field is `Null`. (Bug#7612)
- Clone method bug in `MySqlCommand`. (Bug#7478)
- Problem with Multiple resultsets. (Bug#7436)
- `MySqlAdapter.Fill` method throws error message `Non-negative number required`. (Bug#7345)
- `MySqlCommand.Connection` returns an `IDbConnection`. (Bug#7258)
- Calling prepare causing exception. (Bug#7243)
- Fixed problem with shared memory connections.
- Added or filled out several more topics in the API reference documentation.
- Fixed another small problem with prepared statements.
- Fixed problem that causes named pipes to not work with some blob functionality.

E.4.22. Changes in MySQL Connector/NET Version 1.0.3 (12 October 2004)

Bugs fixed:

- Invalid query string when using inout parameters (Bug#7133)
- Inserting `DateTime` causes `System.InvalidCastException` to be thrown. (Bug#7132)
- `MySqlDateTime` in Databases sorting by Text, not Date. (Bug#7032)
- Exception stack trace lost when re-throwing exceptions. (Bug#6983)
- Errors in parsing stored procedure parameters. (Bug#6902)
- `InvalidCast` when using `DATE_ADD`-function. (Bug#6879)
- Int64 Support in `MySqlCommand` Parameters. (Bug#6863)
- Test suite fails with MySQL 4.0 because of case sensitivity of table names. (Bug#6831)
- `MySqlDataReader.GetChar(int i)` throws `IndexOutOfRangeException` exception. (Bug#6770)
- Integer "out" parameter from stored procedure returned as string. (Bug#6668)
- An Open Connection has been Closed by the Host System. (Bug#6634)
- Fixed Invalid character set index: 200. (Bug#6547)
- Connections now do not have to give a database on the connection string.
- Installer now includes options to install into GAC and create `START MENU` items.
- Fixed major problem with detecting null values when using prepared statements.
- Fixed problem where multiple resultsets having different numbers of columns would cause a problem.
- Added `ServerThread` property to `MySqlConnection` to expose server thread id.
- Added Ping method to `MySqlConnection`.
- Changed the name of the test suite to `MySql.Data.Tests.dll`.
- Now `SHOW COLLATION` is used upon connection to retrieve the full list of charset ids.
- Made MySQL the default named pipe name.

E.4.23. Changes in MySQL Connector/NET Version 1.0.2 (15 November 2004)

Bugs fixed:

- Fixed Objects not being disposed ([Bug#6649](#))
- Fixed Charset-map for UCS-2 ([Bug#6541](#))
- Fixed Zero date "0000-00-00" is returned wrong when filling Dataset ([Bug#6429](#))
- Fixed double type handling in MySqlParameter(string parameterName, object value) ([Bug#6428](#))
- Fixed Installation directory ignored using custom installation ([Bug#6329](#))
- Fixed #HY000 Illegal mix of collations (latin1_swedish_ci,IMPLICIT) and (utf8_general_ ([Bug#6322](#))
- Added the TableEditor CS and VB sample
- Added charset connection string option
- Fixed problem with MySqlBinary where string values could not be used to update extended text columns
- Provider is now using character set specified by server as default
- Updated the installer to include the new samples
- Fixed problem where setting command text leaves the command in a prepared state
- Fixed Long inserts take very long time (Bu #5453)
- Fixed problem where calling stored procedures might cause an "Illegal mix of collations" problem.

E.4.24. Changes in MySQL Connector/NET Version 1.0.1 (27 October 2004)

Bugs fixed:

- Fixed IndexOutOfBounds when reading BLOB with DataReader with GetString(index) ([Bug#6230](#))
- Fixed GetBoolean returns wrong values ([Bug#6227](#))
- Fixed Method TokenizeSql() uses only a limited set of valid characters for parameters ([Bug#6217](#))
- Fixed NET Connector source missing resx files ([Bug#6216](#))
- Fixed System.OverflowException when using YEAR datatype ([Bug#6036](#))
- Fixed MySqlDateTime sets IsZero property on all subseq.records after first zero found ([Bug#6006](#))
- Fixed serializing of floating point parameters (double, numeric, single, decimal) ([Bug#5900](#))
- Fixed missing Reference in DbType setter ([Bug#5897](#))
- Fixed Parsing the ';' char ([Bug#5876](#))
- Fixed DBNull Values causing problems with retrieving/updating queries. ([Bug#5798](#))
- IsNullable error ([Bug#5796](#))
- Fixed problem where MySqlParameterCollection.Add() would throw unclear exception when given a null value ([Bug#5621](#))
- Fixed construtor initialize problems in MySqlCommand() ([Bug#5613](#))
- Fixed Yet Another "object reference not set to an instance of an object" ([Bug#5496](#))
- Fixed Can't display Chinese correctly ([Bug#5288](#))
- Fixed MySqlDataReader and 'show tables from ...' behavior ([Bug#5256](#))
- Fixed problem in PacketReader where it could try to allocate the wrong buffer size in EnsureCapacity
- Fixed problem where using old syntax while using the interfaces caused problems

- Fixed [Bug#5458](#) Calling GetChars on a longtext column throws an exception
- Added test case for resetting the command text on a prepared command
- Fixed [Bug#5388](#) DataReader reports all rows as NULL if one row is NULL
- Fixed problem where connection lifetime on the connect string was not being respected
- Fixed [Bug#5602](#) Possible bug in MySqlParameter(string, object) constructor
- Field buffers being reused to decrease memory allocations and increase speed
- Fixed [Bug#5392](#) MySqlCommand sees "?" as parameters in string literals
- Added Aggregate function test (wasn't really a bug)
- Using PacketWriter instead of Packet for writing to streams
- Implemented SequentialAccess
- Fixed problem with ConnectionInternal where a key might be added more than once
- Fixed Russian character support as well
- Fixed [Bug#5474](#) cannot run a stored procedure populating mysqlcommand.parameters
- Fixed problem where connector was not issuing a CMD_QUIT before closing the socket
- Fixed problem where Min Pool Size was not being respected
- Refactored compression code into CompressedStream to clean up NativeDriver
- CP1252 is now used for Latin1 only when the server is 4.1.2 and later
- Fixed [Bug#5469](#) Setting DbType throws NullReferenceException
- Virtualized driver subsystem so future releases could easily support client or embedded server support

E.4.25. Changes in MySQL Connector/NET Version 1.0.0 (01 September 2004)

Bugs fixed:

- Thai encoding not correctly supported. ([Bug#3889](#))
- Bumped version number to 1.0.0 for beta 1 release.
- Removed all of the XML comment warnings.
- Added [COPYING.rtf](#) file for use in installer.
- Updated many of the test cases.
- Fixed problem with using compression.
- Removed some last references to ByteFX.

E.4.26. Changes in MySQL Connector/NET Version 0.9.0 (30 August 2004)

- Added test fixture for prepared statements.
- All type classes now implement a [SerializeBinary](#) method for sending their data to a [PacketWriter](#).
- Added [PacketWriter](#) class that will enable future low-memory large object handling.
- Fixed many small bugs in running prepared statements and stored procedures.
- Changed command so that an exception will not be thrown in executing a stored procedure with parameters in old syntax mode.

- [SingleRow](#) behavior now working right even with limit.
- [GetBytes](#) now only works on binary columns.
- Logger now truncates long sql commands so blob columns don't blow out our log.
- host and database now have a default value of "" unless otherwise set.
- Connection Timeout seems to be ignored. ([Bug#5214](#))
- Added test case for bug# 5051: [GetSchema](#) not working correctly.
- Fixed problem where [GetSchema](#) would return false for [IsUnique](#) when the column is key.
- [MySqlDataReader](#) [GetXXX](#) methods now using the field level [MySqlValue](#) object and not performing conversions.
- [DataReader](#) returning `NULL` for time column. ([Bug#5097](#))
- Added test case for `LOAD DATA LOCAL INFILE`.
- Added `replacetext` custom nant task.
- Added [CommandBuilderTest](#) fixture.
- Added Last One Wins feature to [CommandBuilder](#).
- Fixed persist security info case problem.
- Fixed [GetBool](#) so that 1, true, "true", and "yes" all count as true.
- Make parameter mark configurable.
- Added the "old syntax" connection string parameter to allow use of @ parameter marker.
- [MySqlCommandBuilder](#). ([Bug#4658](#))
- [ByteFX.MySqlClient](#) caches passwords if `Persist Security Info` is false. ([Bug#4864](#))
- Updated license banner in all source files to include FLOSS exception.
- Added new `.Types` namespace and implementations for most current MySQL types.
- Added [MySqlField41](#) as a subclass of [MySqlField](#).
- Changed many classes to now use the new `.Types` types.
- Changed type `enum int` to `Int32`, `short` to `Int16`, and `bigint` to `Int64`.
- Added dummy types `UInt16`, `UInt32`, and `UInt64` to allow an unsigned parameter to be made.
- Connections are now reset when they are pulled from the connection pool.
- Refactored auth code in driver so it can be used for both auth and reset.
- Added [UserReset](#) test in `PoolingTests.cs`.
- Connections are now reset using `COM_CHANGE_USER` when pulled from the pool.
- Implemented [SingleResultSet](#) behavior.
- Implemented support of unicode.
- Added char set mappings for utf-8 and ucs-2.
- Time fields overflow using `bytefx .net mysql driver` ([Bug#4520](#))
- Modified time test in data type test fixture to check for time spans where hours > 24.
- Wrong string with backslash escaping in `ByteFx.Data.MySqlClient.MySqlParameter`. ([Bug#4505](#))
- Added code to Parameter test case `TestQuoting` to test for backslashes.

- [MySQLCommandBuilder](#) fails with multi-word column names. ([Bug#4486](#))
- Fixed bug in [TokenizeSql](#) where underscore would terminate character capture in parameter name.
- Added test case for spaces in column names.
- [MySQLDataReader.GetBytes](#) don't works correctly. ([Bug#4324](#))
- Added [GetBytes\(\)](#) test case to [DataReader](#) test fixture.
- Now reading all server variables in [InternalConnection.Configure](#) into [Hashtable](#).
- Now using [string\[\]](#) for index map in [CharSetMap](#).
- Added CRInSQL test case for carriage returns in SQL.
- Setting [maxPacketSize](#) to default value in [Driver.ctor](#).
- Setting [MySQLDbType](#) on a parameter doesn't set generic type. ([Bug#4442](#))
- Removed obsolete data types [Long](#) and [LongLong](#).
- Overflow exception thrown when using "use pipe" on connection string. ([Bug#4071](#))
- Changed "use pipe" keyword to "pipe name" or just "pipe".
- Allow reading multiple resultsets from a single query.
- Added flags attribute to [ServerStatusFlags](#) enum.
- Changed name of [ServerStatus](#) enum to [ServerStatusFlags](#).
- Inserted data row doesn't update properly.
- Error processing show create table. ([Bug#4074](#))
- Change [Packet.ReadLenInteger](#) to [ReadPackedLong](#) and added [packet.ReadPackedInteger](#) that always reads integers packed with 2,3,4.
- Added [syntax.cs](#) test fixture to test various SQL syntax bugs.
- Improper handling of time values. Now time value of 00:00:00 is not treated as null. ([Bug#4149](#))
- Moved all test suite files into [TestSuite](#) folder.
- Fixed bug where null column would move the result packet pointer backward.
- Added new nant build script.
- Clear tablename so it will be regen'ed properly during the next [GenerateSchema](#). ([Bug#3917](#))
- [GetValues](#) was always returning zero and was also always trying to copy all fields rather than respecting the size of the array passed in. ([Bug#3915](#))
- Implemented shared memory access protocol.
- Implemented prepared statements for MySQL 4.1.
- Implemented stored procedures for MySQL 5.0.
- Renamed [MySQLInternalConnection](#) to [InternalConnection](#).
- SQL is now parsed as chars, fixes problems with other languages.
- Added logging and allow batch connection string options.
- [RowUpdating](#) event not set when setting the [DataAdapter](#) property. ([Bug#3888](#))
- Fixed bug in char set mapping.
- Implemented 4.1 authentication.

- Improved open/auth code in driver.
- Improved how connection bits are set during connection.
- Database name is now passed to server during initial handshake.
- Changed namespace for client to `MySql.Data.MySqlClient`.
- Changed assembly name of client to `MySql.Data.dll`.
- Changed license text in all source files to GPL.
- Added the `MySqlClient.build` Nant file.
- Removed the mono batch files.
- Moved some of the unused files into notused folder so nant build file can use wildcards.
- Implemented shared memory accesss.
- Major revamp in code structure.
- Prepared statements now working for MySql 4.1.1 and later.
- Finished implementing auth for 4.0, 4.1.0, and 4.1.1.
- Changed namespace from `MySQL.Data.MySQLClient` back to `MySql.Data.MySqlClient`.
- Fixed bug in `CharSetMapping` where it was trying to use text names as ints.
- Changed namespace to `MySQL.Data.MySQLClient`.
- Integrated auth changes from UC2004.
- Fixed bug where calling any of the `GetXXX` methods on a datareader before or after reading data would not throw the appropriate exception (thanks Luca Morelli).
- Added `TimeSpan` code in `parameter.cs` to properly serialize a timespan object to mysql time format (thanks Gianluca Colombo).
- Added `TimeStamp` to parameter serialization code. Prevented `DataAdatper` updates from working right (thanks Michael King).
- Fixed a misspelling in `MySqlHelper.cs` (thanks Patrick Kristiansen).

E.4.27. Changes in MySQL Connector/NET Version 0.76

- Driver now using charset number given in handshake to create encoding.
- Changed command editor to point to `MySqlClient.Design`.
- Fixed bug in `Version.isAtLeast`.
- Changed `DBConnectionString` to support changes done to `MySqlConnectionString`.
- Removed `SqlCommandEditor` and `DataAdapterPreviewDialog`.
- Using new long return values in many places.
- Integrated new `CompressedStream` class.
- Changed `ConnectionString` and added attributes to allow it to be used in `MySqlClient.Design`.
- Changed `packet.cs` to support newer lengths in `ReadLenInteger`.
- Changed other classes to use new properties and fields of `MySqlConnectionString`.
- `ConnectionInternal` is now using PING to see whether the server is alive.
- Moved toolbox bitmaps into resource folder.

- Changed `field.cs` to allow values to come directly from row buffer.
- Changed to use the new driver.Send syntax.
- Using a new packet queueing system.
- Started work handling the "broken" compression packet handling.
- Fixed bug in `StreamCreator` where failure to connect to a host would continue to loop infinitely (thanks Kevin Casella).
- Improved connectstring handling.
- Moved designers into Pro product.
- Removed some old commented out code from `command.cs`.
- Fixed a problem with compression.
- Fixed connection object where an exception throw prior to the connection opening would not leave the connection in the connecting state (thanks Chris Cline).
- Added GUID support.
- Fixed sequence out of order bug (thanks Mark Reay).

E.4.28. Changes in MySQL Connector/NET Version 0.75

- Enum values now supported as parameter values (thanks Philipp Sumi).
- Year datatype now supported.
- Fixed compression.
- Fixed bug where a parameter with a `TimeSpan` as the value would not serialize properly.
- Fixed bug where default constructor would not set default connection string values.
- Added some XML comments to some members.
- Work to fix/improve compression handling.
- Improved `ConnectionString` handling so that it better matches the standard set by `SqlClient`.
- A `MySqlException` is now thrown if a username is not included in the connection string.
- Localhost is now used as the default if not specified on the connection string.
- An exception is now thrown if an attempt is made to set the connection string while the connection is open.
- Small changes to `ConnectionString` docs.
- Removed `MultiHostStream` and `MySqlStream`. Replaced it with `Common/StreamCreator`.
- Added support for Use Pipe connection string value.
- Added Platform class for easier access to platform utility functions.
- Fixed small pooling bug where new connection was not getting created after `IsAlive` fails.
- Added `Platform.cs` and `StreamCreator.cs`.
- Fixed `Field.cs` to properly handle 4.1 style timestamps.
- Changed `Common.Version` to `Common.DBVersion` to avoid name conflict.
- Fixed `field.cs` so that text columns return the right field type.
- Added `MySqlError` class to provide some reference for error codes (thanks Geert Veenstra).

E.4.29. Changes in MySQL Connector/NET Version 0.74

- Added Unix socket support (thanks Mohammad DAMT).
- Only calling `Thread.Sleep` when no data is available.
- Improved escaping of quote characters in parameter data.
- Removed misleading comments from `parameter.cs`.
- Fixed pooling bug.
- Fixed `ConnectionString` editor dialog (thanks marco p (pomarc)).
- `UserId` now supported in connection strings (thanks Jeff Neeley).
- Attempting to create a parameter that is not input throws an exception (thanks Ryan Gregg).
- Added much documentation.
- Checked in new `MultiHostStream` capability. Big thanks to Dan Guisinger for this. he originally submitted the code and idea of supporting multiple machines on the connect string.
- Added a lot of documentation.
- Fixed speed issue with 0.73.
- Changed to `Thread.Sleep(0)` in `MySqlDataStream` to help optimize the case where it doesn't need to wait (thanks Todd German).
- Repopulating the idlepools to `MinPoolSize`.
- Fixed `MySqlPool` deadlock condition as well as stupid bug where `CreateNewPooledConnection` was not ever adding new connections to the pool. Also fixed `MySqlStream.ReadBytes` and `ReadByte` to not use `TicksPerSecond` which does not appear to always be right. (thanks Matthew J. Peddlesden)
- Fix for precision and scale (thanks Matthew J. Peddlesden).
- Added `Thread.Sleep(1)` to stream reading methods to be more cpu friendly (thanks Sean McGinnis).
- Fixed problem where `ExecuteReader` would sometime return null (thanks Lloyd Dupont).
- Fixed major bug with null field handling (thanks Naucki).
- Enclosed queries for `max_allowed_packet` and `characterset` inside try catch (and set defaults).
- Fixed problem where socket was not getting closed properly (thanks Steve!).
- Fixed problem where `ExecuteNonQuery` was not always returning the right value.
- Fixed `InternalConnection` to not use `@@session.max_allowed_packet` but use `@@max_allowed_packet`. (Thanks Miguel)
- Added many new XML doc lines.
- Fixed sql parsing to not send empty queries (thanks Rory).
- Fixed problem where the reader was not unpeeking the packet on close.
- Fixed problem where user variables were not being handled (thanks Sami Vaaraniemi).
- Fixed loop checking in the `MySqlPool` (thanks Steve M. Brown)
- Fixed `ParameterCollection.Add` method to match `SqlClient` (thanks Joshua Mouch).
- Fixed `ConnectionString` parsing to handle no and yes for boolean and not lowercase values (thanks Naucki).
- Added `InternalConnection` class, changes to pooling.
- Implemented Persist Security Info.

- Added `security.cs` and `version.cs` to project
- Fixed `DateTime` handling in `Parameter.cs` (thanks Burkhard Perken-Golomb).
- Fixed parameter serialization where some types would throw a cast exception.
- Fixed `DataReader` to convert all returned values to prevent casting errors (thanks Keith Murray).
- Added code to `Command.ExecuteReader` to return null if the initial SQL command throws an exception (thanks Burkhard Perken-Golomb).
- Fixed `ExecuteScalar` bug introduced with restructure.
- Restructure to allow for `LOCAL DATA INFILE` and better sequencing of packets.
- Fixed several bugs related to restructure.
- Early work done to support more secure passwords in Mysql 4.1. Old passwords in 4.1 not supported yet.
- Parameters appearing after system parameters are now handled correctly (Adam M. (adamml)).
- Strings can now be assigned directly to blob fields (Adam M.).
- Fixed float parameters (thanks Pent).
- Improved Parameter constructor and `ParameterCollection.Add` methods to better match `SqlCommand` (thanks Joshua Mouch).
- Corrected `Connection.CreateCommand` to return a `MySqlCommand` type.
- Fixed connection string designer dialog box problem (thanks Abraham Guyt).
- Fixed problem with sending commands not always reading the response packet (thanks Joshua Mouch).
- Fixed parameter serialization where some blobs types were not being handled (thanks Sean McGinnis).
- Removed spurious `MessageBox.show` from `DataReader` code (thanks Joshua Mouch).
- Fixed a nasty bug in the split sql code (thanks everyone!).

E.4.30. Changes in MySQL Connector/NET Version 0.71

- Fixed bug in `MySqlStream` where too much data could attempt to be read (thanks Peter Belbin)
- Implemented `HasRows` (thanks Nash Pherson).
- Fixed bug where tables with more than 252 columns cause an exception (thanks Joshua Kessler).
- Fixed bug where SQL statements ending in ; would cause a problem (thanks Shane Krueger).
- Fixed bug in driver where error messages were getting truncated by 1 character (thanks Shane Krueger).
- Made `MySqlException` serializable (thanks Mathias Hasselmann).

E.4.31. Changes in MySQL Connector/NET Version 0.70

- Updated some of the character code pages to be more accurate.
- Fixed problem where readers could be opened on connections that had readers open.
- Moved test to separate assembly `MySqlClientTests`.
- Fixed stupid problem in driver with sequence out of order (Thanks Peter Belbin).
- Added some pipe tests.
- Increased default max pool size to 50.

- Compiles with Mono 0-24.
- Fixed connection and data reader dispose problems.
- Added `String` datatype handling to parameter serialization.
- Fixed sequence problem in driver that occurred after thrown exception (thanks Burkhard Perens-Golomb).
- Added support for `CommandBehavior.SingleRow` to `DataReader`.
- Fixed command sql processing so quotes are better handled (thanks Theo Spears).
- Fixed parsing of double, single, and decimal values to account for non-English separators. You still have to use the right syntax if you using hard coded sql, but if you use parameters the code will convert floating point types to use '.' appropriately internal both into the server and out.
- Added `MySQLStream` class to simplify timeouts and driver coding.
- Fixed `DataReader` so that it is closed properly when the associated connection is closed. [thanks smishra]
- Made client more `SqlClient` compliant so that `DataReaders` have to be closed before the connection can be used to run another command.
- Improved `DBNull.Value` handling in the fields.
- Added several unit tests.
- Fixed `MySqlException` base class.
- Improved driver coding
- Fixed bug where `NextResult` was returning false on the last resultset.
- Added more tests for MySQL.
- Improved casting problems by equating unsigned 32bit values to `Int64` and unsigned 16bit values to `Int32`, and so forth.
- Added new constructor for `MySQLParameter` for (name, type, size, srccol)
- Fixed bug in `MySQLDataReader` where it didn't check for null fieldlist before returning field count.
- Started adding `MySQLClient` unit tests (added `MySQLClient/Tests` folder and some test cases).
- Fixed some things in Connection String handling.
- Moved `INIT_DB` to `MySQLPool`. I may move it again, this is in preparation of the conference.
- Fixed bug inside `CommandBuilder` that prevented inserts from happening properly.
- Reworked some of the internals so that all three execute methods of `Command` worked properly.
- Fixed many small bugs found during benchmarking.
- The first cut of `CoonnectionPooling` is working. "min pool size" and "max pool size" are respected.
- Work to enable multiple resultsets to be returned.
- Character sets are handled much more intelligently now. The driver queries MySQL at startup for the default character set. That character set is then used for conversions if that code page can be loaded. If not, then the default code page for the current OS is used.
- Added code to save the inferred type in the name,value constructor of `Parameter`.
- Also, inferred type if value of null parameter is changed using `Value` property.
- Converted all files to use proper Camel case. MySQL is now `MySql` in all files. `PgSQL` is now `PgSql`.
- Added attribute to `PgSql` code to prevent designer from trying to show.
- Added `MySQLDbType` property to `Parameter` object and added proper conversion code to convert from `DbType` to `MySQLDbType`).

- Removed unused `ObjectToString` method from `MySQLParameter.cs`.
- Fixed `Add(..)` method in `ParameterCollection` so that it doesn't use `Add(name, value)` instead.
- Fixed `IndexOf` and `Contains` in `ParameterCollection` to be aware that parameter names are now stored without `@`.
- Fixed `Command.ConvertSQLToBytes` so it only allows characters that can be in MySQL variable names.
- Fixed `DataReader` and `Field` so that blob fields read their data from `Field.cs` and `GetBytes` works right.
- Added simple query builder editor to `CommandText` property of `MySQLCommand`.
- Fixed `CommandBuilder` and `Parameter` serialization to account for Parameters not storing `@` in their names.
- Removed `MySQLFieldType` enum from `Field.cs`. Now using `MySQLDbType` enum.
- Added `Designer` attribute to several classes to prevent designer view when using VS.Net.
- Fixed Initial catalog typo in `ConnectionString` designer.
- Removed 3 parameter constructor for `MySQLParameter` that conflicted with (name, type, value).
- Changed `MySQLParameter` so `paramName` is now stored without leading `@` (this fixed null inserts when using designer).
- Changed `TypeConverter` for `MySQLParameter` to use the constructor with all properties.

E.4.32. Changes in MySQL Connector/NET Version 0.68

- Fixed sequence issue in driver.
- Added `DbParametersEditor` to make parameter editing more like `SqlClient`.
- Fixed `Command` class so that parameters can be edited using the designer
- Update connection string designer to support `Use Compression` flag.
- Fixed string encoding so that European characters like ä will work correctly.
- Creating base classes to aid in building new data providers.
- Added support for UID key in connection string.
- Field, parameter, command now using `DBNull.Value` instead of null.
- `CommandBuilder` using `DBNull.Value`.
- `CommandBuilder` now builds insert command correctly when an `auto_insert` field is not present.
- Field now uses `typeof` keyword to return `System.Types` (performance).

E.4.33. Changes in MySQL Connector/NET Version 0.65

- `MySQLCommandBuilder` now implemented.
- Transaction support now implemented (not all table types support this).
- `GetSchemaTable` fixed to not use `xsd` (for Mono).
- Driver is now Mono-compatible.
- TIME data type now supported.
- More work to improve Timestamp data type handling.
- Changed signatures of all classes to match corresponding `SqlClient` classes.

E.4.34. Changes in MySQL Connector/NET Version 0.60

- Protocol compression using SharpZipLib (www.icsharpcode.net).
- Named pipes on Windows now working properly.
- Work done to improve [Timestamp](#) data type handling.
- Implemented [IEnumerable](#) on [DataReader](#) so [DataGrid](#) would work.

E.4.35. Changes in MySQL Connector/NET Version 0.50

- Speed increased dramatically by removing bugging network sync code.
- Driver no longer buffers rows of data (more ADO.Net compliant).
- Conversion bugs related to [TIMESTAMP](#) and [DATETIME](#) fields fixed.

E.5. MySQL Visual Studio Plugin Change History

Note

As of Connector/NET 5.1.2 (14 June 2007), the Visual Studio Plugin is part of the main Connector/NET package. For the change history for the Visual Studio Plugin, see [Section E.4, "Connector/NET Change History"](#).

E.5.1. Changes in MySQL Visual Studio Plugin 1.0.3 (Not yet released)

Bugs fixed:

- Running queries based on a stored procedure would cause the dataset designer to terminate. (Bugs #26364)
- DataSet wizard would show all tables instead of only the tables available within the selected database. (Bugs #26348)

E.5.2. Changes in MySQL Visual Studio Plugin 1.0.2 (Not yet released)

Bugs fixed:

- The Add Connection dialog of the Server Explorer would freeze when accessing databases with capitalized characters in their name. (Bug#24875)
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/NET 5.0.2 must be installed. (Bug#23071)

E.5.3. Changes in MySQL Visual Studio Plugin 1.0.1 (4 October 2006)

This is a bug fix release to resolve an incompatibility issue with Connector/NET 5.0.1.

It is critical that this release only be used with Connector/NET 5.0.1. After installing Connector/NET 5.0.1, you will need to make a small change in your machine.config file. This file should be located at `%win%\Microsoft.Net\Framework\v2.0.50727\CONFIG\machine.config` (`%win%` should be the location of your Windows folder). Near the bottom of the file you will see a line like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data" />
```

It needs to be changed to be like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data,
Version=5.0.1.0, Culture=neutral, PublicKeyToken=c5687fc88969c44d" />
```

E.5.4. Changes in MySQL Visual Studio Plugin 1.0.0 (4 October 2006)

Bugs fixed:

- Ability to work with MySQL objects (tables, views, stored procedures, etc) from within Server Explorer.
- DDEX (Data Designer Extensibility) compatibility.

E.6. MySQL Connector/J Change History

E.6.1. Changes in MySQL Connector/J 5.1.x

E.6.1.1. Changes in MySQL Connector/J 5.1.5 (09 October 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 [NCHAR](#), [NVARCHAR](#) and [NCLOB](#) types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query via [SHOW PROCESSLIST](#) on a MySQL server, or can be extended to support custom persistence of the information via a public interface).
- Support for JDBC-4.0 XML processing via JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Added [autoSlowLog](#) configuration property, overrides [slowQueryThreshold*](#) properties, driver determines slow queries by those that are slower than 5 * stddev of the mean query time (outside the 96% percentile).

Bugs fixed:

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. ([Bug#28256](#))

E.6.1.2. Changes in MySQL Connector/J 5.1.4 (Not Released)

Only released internally.

E.6.1.3. Changes in MySQL Connector/J 5.1.3 (10 September 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 [NCHAR](#), [NVARCHAR](#) and [NCLOB](#) types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query via [SHOW PROCESSLIST](#) on a MySQL server, or can be extended to support custom persistence of the information via a public interface).
- Support for JDBC-4.0 XML processing via JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Connector/J now connects using an initial character set of [utf-8](#) solely for the purpose of authentication to allow user names or database names in any character set to be used in the JDBC connection URL. ([Bug#29853](#))

- Added two configuration parameters:
 - `blobsAreStrings` — Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
 - `functionsNeverReturnBlobs` — Should the driver always treat data from functions returning BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Setting `rewriteBatchedStatements` to `true` now causes CallableStatements with batched arguments to be re-written in the form "CALL (...); CALL (...); ..." to send the batch in as few client-server round trips as possible.
- The driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.
- The data (and how it's stored) for `ResultSet` rows are now behind an interface which allows us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Added experimental support for statement "interceptors" via the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`. Implement this interface to be placed "in between" query execution, so that it can be influenced (currently experimental).
- The driver will automatically adjust the server session variable `net_write_timeout` when it determines its been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (The configuration property is named `netTimeoutForStreamingResults`, with a unit of seconds, the value '0' means the driver will not try and adjust this value).
- JDBC-4.0 ease-of-development features including auto-registration with the `DriverManager` via the service provider mechanism, standardized Connection validity checks and categorized `SQLExceptions` based on recoverability/retry-ability and class of the underlying error.
- `Statement.setQueryTimeout()`s now affect the entire batch for batched statements, rather than the individual statements that make up the batch.
- Errors encountered during `Statement/PreparedStatement/CallableStatement.executeBatch()` when `rewriteBatchStatements` has been set to `true` now return `BatchUpdateExceptions` according to the setting of `continueBatchOnError`.

If `continueBatchOnError` is set to `true`, the update counts for the "chunk" that were sent as one unit will all be set to `EXECUTE_FAILED`, but the driver will attempt to process the remainder of the batch. You can determine which "chunk" failed by looking at the update counts returned in the `BatchUpdateException`.

If `continueBatchOnError` is set to "false", the update counts returned will contain all updates up-to and including the failed "chunk", with all counts for the failed "chunk" set to `EXECUTE_FAILED`.

Since MySQL doesn't return multiple error codes for multiple-statements, or for multi-value `INSERT/REPLACE`, it is the application's responsibility to handle determining which item(s) in the "chunk" actually failed.

- New methods on `com.mysql.jdbc.Statement`: `setLocalInfileInputStream()` and `getLocalInfileInputStream()`:
 - `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.
 - `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.

This method returns `NULL` if no such stream has been set via `setLocalInfileInputStream()`.
- Setting `useBlobToStoreUTF8OutsideBMP` to `true` tells the driver to treat `[MEDIUM/LONG]BLOB` columns as `[LONG]VARCHAR` columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server can't handle natively.

Set `utf8OutsideBmpExcludedColumnNamePattern` to a regex so that column names matching the given regex will still be treated as `BLOBs`. The regex must follow the patterns used for the `java.util.regex` package. The default is to exclude no columns, and include all columns.

Set `utf8OutsideBmpIncludedColumnNamePattern` to specify exclusion rules to `utf8OutsideBmpExcludedColumnNamePattern`. The regex must follow the patterns used for the `java.util.regex` package.

Bugs fixed:

- `setObject(int, Object, int, int)` delegate in `PreparedStatementWrapper` delegates to wrong method. (Bug#30892)
- NPE with null column values when `padCharsWithSpace` is set to true. (Bug#30851)
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. (Bug#30664)
- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug#30550)
- Closing a load-balanced connection would cause a `ClassCastException`. (Bug#29852)
- Connection checker for JBoss didn't use same method parameters via reflection, causing connections to always seem "bad". (Bug#29106)
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3-5.0.5 and 65 for versions newer than 5.0.5. (Bug#28972)
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.
The fix involves changing the behavior of `noAccessToProcedureBodies`, in that the driver will now report all parameters as "IN" parameters but allow callers to call `registerOutParameter()` on them without throwing an exception. (Bug#28689)
- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug#27915)
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug#27867)
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version ≥ 4.1 . (Bug#27182)
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug#21116)
- Specifying a "validation query" in your connection pool that starts with `"/ * ping */"` _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a `ReplicationConnection` or a `LoadBalancedConnection`, will send the ping across all active connections.

E.6.1.4. Changes in MySQL Connector/J 5.1.2 (29 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Functionality added or changed:

- Setting the configuration property `rewriteBatchedStatements` to `true` will now cause the driver to rewrite batched prepared statements with more than 3 parameter sets in a batch into multi-statements (separated by ";") if they are not plain (i.e. without `SELECT` or `ON DUPLICATE KEY UPDATE` clauses) `INSERT` or `REPLACE` statements.

E.6.1.5. Changes in MySQL Connector/J 5.1.1 (22 June 2007)

This is a new Alpha development release, adding new features and fixing recently discovered bugs.

Functionality added or changed:

- **Incompatible Change:** Pulled vendor-extension methods of `Connection` implementation out into an interface to support `java.sql.Wrapper` functionality from `ConnectionPoolDataSource`. The vendor extensions are javadoc'd in the `com.mysql.jdbc.Connection` interface.

For those looking further into the driver implementation, it is not an API that is used for plugability of implementations inside our driver (which is why there are still references to `ConnectionImpl` throughout the code).

We've also added server and client `prepareStatement()` methods that cover all of the variants in the JDBC API.

`Connection.serverPrepare(String)` has been re-named to `Connection.serverPrepareStatement()` for consistency with `Connection.clientPrepareStatement()`.

- Row navigation now causes any streams/readers open on the result set to be closed, as in some cases we're reading directly from a shared network packet and it will be overwritten by the "next" row.
- Made it possible to retrieve prepared statement parameter bindings (to be used in `StatementInterceptors`, primarily).
- Externalized the descriptions of connection properties.
- The data (and how it's stored) for `ResultSet` rows are now behind an interface which allows us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Similar to `Connection`, we pulled out vendor extensions to `Statement` into an interface named `com.mysql.Statement`, and moved the `Statement` class into `com.mysql.StatementImpl`. The two methods (javadoc'd in `com.mysql.Statement` are `enableStreamingResults()`, which already existed, and `disableStreamingResults()` which sets the statement instance back to the fetch size and result set type it had before `enableStreamingResults()` was called.
- Driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.
- Added experimental support for statement "interceptors" via the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`.

Implement this interface to be placed "in between" query execution, so that you can influence it. (currently experimental).

`StatementInterceptors` are "chainable" when configured by the user, the results returned by the "current" interceptor will be passed on to the next on in the chain, from left-to-right order, as specified by the user in the JDBC configuration property `statementInterceptors`.

- See the sources (fully javadoc'd) for `com.mysql.jdbc.StatementInterceptor` for more details until we iron out the API and get it documented in the manual.
- Setting `rewriteBatchedStatements` to `true` now causes `CallableStatements` with batched arguments to be rewritten in the form `CALL (...); CALL (...); ...` to send the batch in as few client-server round trips as possible.

E.6.1.6. Changes in MySQL Connector/J 5.1.0 (11 April 2007)

This is the first public alpha release of the current Connector/J 5.1 development branch, providing an insight to upcoming features. Although some of these are still under development, this release includes the following new features and changes (in comparison to the current Connector/J 5.0 production release):

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

■ Note

The disabling of server-side prepared statements does not affect the operation of the connector. However, if you use the `useTimezone=true` connection option and use client-side prepared statements (instead of server-side prepared statements) you should also set `useSSPSCompatibleTimezoneShift=true`.

Functionality added or changed:

- Refactored `CommunicationsException` into a JDBC-3.0 version, and a JDBC-4.0 version (which extends `SQLRecoverableException`, now that it exists).

Note

This change means that if you were catching `com.mysql.jdbc.CommunicationsException` in your applications instead of looking at the `SQLState` class of `08`, and are moving to Java 6 (or newer), you need to change your imports to that exception to be `com.mysql.jdbc.exceptions.jdbc4.CommunicationsException`, as the old class will not be instantiated for communications link-related errors under Java 6.

- Added support for JDBC-4.0 categorized `SQLExceptions`.
- Added support for JDBC-4.0's `NCLOB`, and `NCHAR/NVARCHAR` types.
- `com.mysql.jdbc.java6.javac` — full path to your Java-6 `javac` executable
- Added support for JDBC-4.0's `SQLXML` interfaces.
- Re-worked Ant buildfile to build JDBC-4.0 classes separately, as well as support building under Eclipse (since Eclipse can't mix/match JDKs).

To build, you must set `JAVA_HOME` to J2SDK-1.4.2 or Java-5, and set the following properties on your Ant command line:

- `com.mysql.jdbc.java6.javac` — full path to your Java-6 `javac` executable
- `com.mysql.jdbc.java6.rtjar` — full path to your Java-6 `rt.jar` file
- New feature — driver will automatically adjust session variable `net_write_timeout` when it determines it has been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (configuration property is named `netTimeoutForStreamingResults` value and has a unit of seconds, the value `0` means the driver will not try and adjust this value).
- Added support for JDBC-4.0's client information. The backend storage of information provided via `Connection.setClientInfo()` and retrieved by `Connection.getClientInfo()` is pluggable by any class that implements the `com.mysql.jdbc.JDBC4ClientInfoProvider` interface and has a no-args constructor.

The implementation used by the driver is configured using the `clientInfoProvider` configuration property (with a default of value of `com.mysql.jdbc.JDBC4CommentClientInfoProvider`, an implementation which lists the client information as a comment prepended to every query sent to the server).

This functionality is only available when using Java-6 or newer.

- `com.mysql.jdbc.java6.rtjar` — full path to your Java-6 `rt.jar` file
- Added support for JDBC-4.0's `Wrapper` interface.

E.6.2. Changes in MySQL Connector/J 5.0.x

E.6.2.1. Changes in MySQL Connector/J 5.0.8 (09 October 2007)

Functionality added or changed:

- `blobsAreStrings` — Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Added two configuration parameters:
 - `blobsAreStrings` — Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
 - `functionsNeverReturnBlobs` — Should the driver always treat data from functions returning `BLOBs` as Strings.

Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.

- `functionsNeverReturnBlobs` — Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- XAConnections now start in auto-commit mode (as per JDBC-4.0 specification clarification).
- Driver will now fall back to sane defaults for `max_allowed_packet` and `net_buffer_length` if the server reports them incorrectly (and will log this situation at `WARN` level, since it's actually an error condition).

Bugs fixed:

- Connections established using URLs of the form `jdbc:mysql:loadbalance://` weren't doing failover if they tried to connect to a MySQL server that was down. The driver now attempts connections to the next "best" (depending on the load balance strategy in use) server, and continues to attempt connecting to the next "best" server every 250 milliseconds until one is found that is up and running or 5 minutes has passed.

If the driver gives up, it will throw the last-received `SQLException`. (Bug #Bug#31053)

- `setObject(int, Object, int, int)` delegate in `PreparedStatementWrapper` delegates to wrong method. (Bug #Bug#30892)
- NPE with null column values when `padCharsWithSpace` is set to true. (Bug #Bug#30851)
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. (Bug #Bug#30664)
- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug #Bug#30550)
- Closing a load-balanced connection would cause a `ClassCastException`. (Bug #Bug#29852)
- Connection checker for JBoss didn't use same method parameters via reflection, causing connections to always seem "bad". (Bug #Bug#29106)
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3-5.0.5 and 65 for versions newer than 5.0.5. (Bug #Bug#28972)
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.
The fix involves changing the behavior of `noAccessToProcedureBodies`, in that the driver will now report all parameters as "IN" parameters but allow callers to call `registerOutParameter()` on them without throwing an exception. (Bug #Bug#28689)
- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. (Bug #Bug#28256)

- `UNSIGNED` types not reported via `DBMD.getTypeInfo()`, and capitalization of type names is not consistent between `DBMD.getColumns()`, `RSMD.getColumnTypeName()` and `DBMD.getTypeInfo()`.

This fix also ensures that the precision of `UNSIGNED MEDIUMINT` and `UNSIGNED BIGINT` is reported correctly via `DBMD.getColumns()`. (Bug#27916)

- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug #Bug#27915)
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug #Bug#27867)
- Cached metadata with `PreparedStatement.execute()` throws `NullPointerException`. (Bug#27412)
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version ≥ 4.1 . (Bug #Bug#27182)
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug #Bug#21116)
- Specifying a "validation query" in your connection pool that starts with `"/ * ping * /"` _exactly_ will cause the driver to instead

send a ping to the server and return a fake result set (much lighter weight), and when using a `ReplicationConnection` or a `LoadBalancedConnection`, will send the ping across all active connections.

E.6.2.2. Changes in MySQL Connector/J 5.0.7 (20 July 2007)

Functionality added or changed:

- The driver will now automatically set `useServerPrepStmts` to `true` when `useCursorFetch` has been set to `true`, since the feature requires server-side prepared statements in order to function.
- `tcpKeepAlive` - Should the driver set `SO_KEEPALIVE` (default `true`)?
- Give more information in `EOFExceptions` thrown out of `MysqlIO` (how many bytes the driver expected to read, how many it actually read, say that communications with the server were unexpectedly lost).
- Driver detects when it is running in a ColdFusion MX server (tested with version 7), and uses the configuration bundle `coldFusion`, which sets `useDynamicCharsetInfo` to `false` (see previous entry), and sets `useLocalSessionState` and `autoReconnect` to `true`.
- `tcpNoDelay` - Should the driver set `SO_TCP_NODELAY` (disabling the Nagle Algorithm, default `true`)?
- Added configuration property `slowQueryThresholdNanos` - if `useNanosForElapsedTime` is set to `true`, and this property is set to a non-zero value the driver will use this threshold (in nanosecond units) to determine if a query was slow, instead of using millisecond units.
- `tcpRcvBuf` - Should the driver set `SO_RCV_BUF` to the given value? The default value of '0', means use the platform default value for this property.
- Setting `useDynamicCharsetInfo` to `false` now causes driver to use static lookups for collations as well (makes `ResultSetMetadata.isCaseSensitive()` much more efficient, which leads to performance increase for ColdFusion, which calls this method for every column on every table it sees, it appears).
- Added configuration properties to allow tuning of TCP/IP socket parameters:
 - `tcpNoDelay` - Should the driver set `SO_TCP_NODELAY` (disabling the Nagle Algorithm, default `true`)?
 - `tcpKeepAlive` - Should the driver set `SO_KEEPALIVE` (default `true`)?
 - `tcpRcvBuf` - Should the driver set `SO_RCV_BUF` to the given value? The default value of '0', means use the platform default value for this property.
 - `tcpSndBuf` - Should the driver set `SO_SND_BUF` to the given value? The default value of '0', means use the platform default value for this property.
 - `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for `java.net.Socket.setTrafficClass()` for more information.
- Setting the configuration parameter `useCursorFetch` to `true` for MySQL-5.0+ enables the use of cursors that allow Connector/J to save memory by fetching result set rows in chunks (where the chunk size is set by calling `setFetchSize()` on a `Statement` or `ResultSet`) by using fully-materialized cursors on the server.
- `tcpSndBuf` - Should the driver set `SO_SND_BUF` to the given value? The default value of '0', means use the platform default value for this property.
- `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for `java.net.Socket.setTrafficClass()` for more information.
- Added new debugging functionality - Setting configuration property `includeInnodbStatusInDeadlockExceptions` to `true` will cause the driver to append the output of `SHOW ENGINE INNODB STATUS` to deadlock-related exceptions, which will enumerate the current locks held inside InnoDB.
- Added configuration property `useNanosForElapsedTime` - for profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (requires `JDK >= 1.5`)?

Note

If `useNanosForElapsedTime` is set to `true`, and this property is set to "0" (or left default), then elapsed times will still be measured in nanoseconds (if possible), but the slow query threshold will be converted from milliseconds to nanoseconds, and thus have an upper bound of approximately 2000 milliseconds (as that threshold is represented as

■ an integer, not a long).

Bugs fixed:

- Don't send any file data in response to LOAD DATA LOCAL INFILE if the feature is disabled at the client side. This is to prevent a malicious server or man-in-the-middle from asking the client for data that the client is not expecting. Thanks to Jan Kneschke for discovering the exploit and Andrey "Poohie" Hristov, Konstantin Osipov and Sergei Golubchik for discussions about implications and possible fixes. ([Bug#29605](#))
- Parser in client-side prepared statements runs to end of statement, rather than end-of-line for '#' comments. Also added support for '--' single-line comments. ([Bug#28956](#))
- Parser in client-side prepared statements eats character following '/' if it's not a multi-line comment. ([Bug#28851](#))
- PreparedStatement.getMetaData() for statements containing leading one-line comments is not returned correctly.

As part of this fix, we also overhauled detection of DML for `executeQuery()` and `SELECT`s for `executeUpdate()` in plain and prepared statements to be aware of the same types of comments. ([Bug#28469](#))

E.6.2.3. Changes in MySQL Connector/J 5.0.6 (15 May 2007)

Functionality added or changed:

- Added an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment (This is not for master-slave replication. For that, we suggest you look at [ReplicationConnection](#) or [lbpool](#)).

If the JDBC URL starts with `jdbc:mysql:loadbalance://host-1,host-2,...host-n`, the driver will create an implementation of `java.sql.Connection` that load balances requests across a series of MySQL JDBC connections to the given hosts, where the balancing takes place after transaction commit.

Therefore, for this to work (at all), you must use transactions, even if only reading data.

Physical connections to the given hosts will not be created until needed.

The driver will invalidate connections that it detects have had communication errors when processing a request. A new connection to the problematic host will be attempted the next time it is selected by the load balancing algorithm.

There are two choices for load balancing algorithms, which may be specified by the `loadBalanceStrategy` JDBC URL configuration property:

- `random` — the driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- `bestResponseTime` — the driver will route the request to the host that had the best response time for the previous transaction.
- `bestResponseTime` — the driver will route the request to the host that had the best response time for the previous transaction.
- Added configuration property `padCharsWithSpace` (defaults to `false`). If set to `true`, and a result set column has the `CHAR` type and the value does not fill the amount of characters specified in the DDL for the column, the driver will pad the remaining characters with space (for ANSI compliance).
- When `useLocalSessionState` is set to `true` and connected to a MySQL-5.0 or later server, the JDBC driver will now determine whether an actual `commit` or `rollback` statement needs to be sent to the database when `Connection.commit()` or `Connection.rollback()` is called.

This is especially helpful for high-load situations with connection pools that always call `Connection.rollback()` on connection check-in/check-out because it avoids a round-trip to the server.

- Added configuration property `useDynamicCharsetInfo`. If set to `false` (the default), the driver will use a per-connection cache of character set information queried from the server when necessary, or when set to `true`, use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver.

■ **Note**

This only affects the `padCharsWithSpace` configuration property and the `ResultSetMetaData.getColumnDisplayWidth()` method.

- New configuration property, `enableQueryTimeouts` (default `true`).

When enabled, query timeouts set via `Statement.setQueryTimeout()` use a shared `java.util.Timer` instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the `TimerTask` for the given timeout which won't be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality. (this configuration property is part of the `maxPerformance` configuration bundle).

- Give better error message when "streaming" result sets, and the connection gets clobbered because of exceeding `net_write_timeout` on the server.
- `random` — the driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- `com.mysql.jdbc.[NonRegistering]Driver` now understands URLs of the format `jdbc:mysql:replication://` and `jdbc:mysql:loadbalance://` which will create a `ReplicationConnection` (exactly like when using `[NonRegistering]ReplicationDriver`) and an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment, respectively.

In an effort to simplify things, we're working on deprecating multiple drivers, and instead specifying different core behavior based upon JDBC URL prefixes, so watch for `[NonRegistering]ReplicationDriver` to eventually disappear, to be replaced with `com.mysql.jdbc.[NonRegistering]Driver` with the new URL prefix.

- Fixed issue where a failed-over connection would let an application call `setReadOnly(false)`, when that call should be ignored until the connection is reconnected to a writable master unless `failoverReadOnly` had been set to `false`.
- Driver will now use `INSERT INTO ... VALUES (DEFAULT)` form of statement for updatable result sets for `ResultSet.insertRow()`, rather than pre-populating the insert row with values from `DatabaseMetaData.getColumns()` (which results in a `SHOW FULL COLUMNS` on the server for every result set). If an application requires access to the default values before `insertRow()` has been called, the JDBC URL should be configured with `populateInsertRowWithDefaultValues` set to `true`.

This fix specifically targets performance issues with ColdFusion and the fact that it seems to ask for updatable result sets no matter what the application does with them.

- More intelligent initial packet sizes for the "shared" packets are used (512 bytes, rather than 16K), and initial packets used during handshake are now sized appropriately as to not require reallocation.

Bugs fixed:

- More useful error messages are generated when the driver thinks a result set is not updatable. (Thanks to Ashley Martens for the patch). ([Bug#28085](#))
- `Connection.getTransactionIsolation()` uses `"SHOW VARIABLES LIKE"` which is very inefficient on MySQL-5.0+ servers. ([Bug#27655](#))
- Fixed issue where calling `getGeneratedKeys()` on a prepared statement after calling `execute()` didn't always return the generated keys (`executeUpdate()` worked fine however). ([Bug#27655](#))
- `CALL /* ... */ some_proc()` doesn't work. As a side effect of this fix, you can now use `/* */` and `#` comments when preparing statements using client-side prepared statement emulation.

If the comments happen to contain parameter markers (?), they will be treated as belonging to the comment (that is, not recognized) rather than being a parameter of the statement.

Note

The statement when sent to the server will contain the comments as-is, they're not stripped during the process of preparing the `PreparedStatement` or `CallableStatement`.

([Bug#27400](#))

- `ResultSet.get*()` with a column index < 1 returns misleading error message. ([Bug#27317](#))

- Using `ResultSet.get*()` with a column index less than 1 returns a misleading error message. (Bug#27317)
- Comments in DDL of stored procedures/functions confuse procedure parser, and thus metadata about them can not be created, leading to inability to retrieve said metadata, or execute procedures that have certain comments in them. (Bug#26959)
- Fast date/time parsing doesn't take into account `00:00:00` as a legal value. (Bug#26789)
- `PreparedStatement` is not closed in `BlobFromLocator.getBytes()`. (Bug#26592)
- When the configuration property `useCursorFetch` was set to `true`, sometimes server would return new, more exact metadata during the execution of the server-side prepared statement that enables this functionality, which the driver ignored (using the original metadata returned during `prepare()`), causing corrupt reading of data due to type mismatch when the actual rows were returned. (Bug#26173)
- `CallableStatements` with `OUT/INOUT` parameters that are "binary" (`BLOB`, `BIT`, `(VAR) BINARY`, `JAVA_OBJECT`) have extra 7 bytes. (Bug#25715)
- Whitespace surrounding storage/size specifiers in stored procedure parameters declaration causes `NumberFormatException` to be thrown when calling stored procedure on JDK-1.5 or newer, as the Number classes in JDK-1.5+ are whitespace intolerant. (Bug#25624)
- Client options not sent correctly when using SSL, leading to stored procedures not being able to return results. Thanks to Don Cohen for the bug report, testcase and patch. (Bug#25545)
- `Statement.setMaxRows()` is not effective on result sets materialized from cursors. (Bug#25517)
- `BIT(> 1)` is returned as `java.lang.String` from `ResultSet.getObject()` rather than `byte[]`. (Bug#25328)

E.6.2.4. Changes in MySQL Connector/J 5.0.5 (02 March 2007)

Functionality added or changed:

- Usage Advisor will now issue warnings for result sets with large numbers of rows. You can configure the trigger value by using the `resultSetSizeThreshold` parameter, which has a default value of 100.
- The `rewriteBatchedStatements` feature can now be used with server-side prepared statements.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmnts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

- Improved speed of `datetime` parsing for ResultSets that come from plain or non-server-side prepared statements. You can enable old implementation with `useFastDateParsing=false` as a configuration parameter.
- Usage Advisor now detects empty results sets and does not report on columns not referenced in those empty sets.
- Fixed logging of XA commands sent to server, it's now configurable via `logXaCommands` property (defaults to `false`).
- Added configuration property `localSocketAddress`, which is the hostname or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.
- We've added a new configuration option `treatUtilDateAsTimestamp`, which is `false` by default, as (1) We already had specific behavior to treat `java.util.Date` as a `java.sql.Timestamp` because it's useful to many folks, and (2) that behavior will very likely be required for drivers JDBC-post-4.0.

Bugs fixed:

- Connection property `socketFactory` wasn't exposed via correctly named mutator/accessor, causing data source implementations that use JavaBean naming conventions to set properties to fail to set the property (and in the case of SJAS, fail silently when trying to set this parameter). (Bug#26326)
- A query execution which timed out did not always throw a `MySQLTimeoutException`. (Bug#25836)

- Storing a `java.util.Date` object in a `BLOB` column would not be serialized correctly during `setObject`. (Bug#25787)
- Timer instance used for `Statement.setQueryTimeout()` created per-connection, rather than per-VM, causing memory leak. (Bug#25514)
- `EscapeProcessor` gets confused by multiple backslashes. We now push the responsibility of syntax errors back on to the server for most escape sequences. (Bug#25399)
- `INOUT` parameters in `CallableStatements` get doubly-escaped. (Bug#25379)
- When using the `rewriteBatchedStatements` connection option with `PreparedStatement.executeBatch()` an internal memory leak would occur. (Bug#25073)
- Fixed issue where field-level for metadata from `DatabaseMetaData` when using `INFORMATION_SCHEMA` didn't have references to current connections, sometimes leading to Null Pointer Exceptions (NPEs) when introspecting them via `ResultSetMetaData`. (Bug#25073)
- `StringUtils.indexOfIgnoreCaseRespectQuotes()` isn't case-insensitive on the first character of the target. This bug also affected `rewriteBatchedStatements` functionality when prepared statements did not use uppercase for the `VALUES` clause. (Bug#25047)
- Client-side prepared statement parser gets confused by in-line comments `/*...*/` and therefore cannot rewrite batch statements or reliably detect the type of statements when they are used. (Bug#25025)
- Results sets from `UPDATE` statements that are part of multi-statement queries would cause an `SQLException` error, "Result is from UPDATE". (Bug#25009)
- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. (Bug#24840)
- Using `DatabaseMetaData.getSQLKeywords()` does not return a all of the of the reserved keywords for the current MySQL version. Current implementation returns the list of reserved words for MySQL 5.1, and does not distinguish between versions. (Bug#24794)
- Calling `Statement.cancel()` could result in a Null Pointer Exception (NPE). (Bug#24721)
- Using `setFetchSize()` breaks prepared `SHOW` and other commands. (Bug#24360)
- Calendars and timezones are now lazily instantiated when required. (Bug#24351)
- Using `DATETIME` columns would result in time shifts when `useServerPrepStmts` was true. The reason was due to different behavior when using client-side compared to server-side prepared statements and the `useJDBCCompliantTimezoneShift` option. This is now fixed if moving from server-side prepared statements to client-side prepared statements by setting `useSSPSCompatibleTimezoneShift` to `true`, as the driver can't tell if this is a new deployment that never used server-side prepared statements, or if it is an existing deployment that is switching to client-side prepared statements from server-side prepared statements. (Bug#24344)
- Connector/J now returns a better error message when server doesn't return enough information to determine stored procedure/function parameter types. (Bug#24065)
- A connection error would occur when connecting to a MySQL server with certain character sets. Some collations/character sets reported as "unknown" (specifically `cias` variants of existing character sets), and inability to override the detected server character set. (Bug#23645)
- Inconsistency between `getSchemas` and `INFORMATION_SCHEMA`. (Bug#23304)
- `DatabaseMetaData.getSchemas()` doesn't return a `TABLE_CATALOG` column. (Bug#23303)
- When using a JDBC connection URL that is malformed, the `NonRegisteringDriver.getPropertyInfo` method will throw a Null Pointer Exception (NPE). (Bug#22628)
- Some exceptions thrown out of `StandardSocketFactory` were needlessly wrapped, obscuring their true cause, especially when using socket timeouts. (Bug#21480)
- When using server-side prepared statements and timestamp columns, value would be incorrectly populated (with nanoseconds, not microseconds). (Bug#21438)
- `ParameterMetaData` throws `NullPointerException` when prepared SQL has a syntax error. Added `generateSimpleParameterMetadata` configuration property, which when set to `true` will generate metadata reflecting `VARCHAR` for every parameter (the default is `false`, which will cause an exception to be thrown if no parameter metadata for the statement is actually available). (Bug#21267)

- Fixed an issue where `XADatasources` couldn't be bound into JNDI, as the `DataSourceFactory` didn't know how to create instances of them.

Other changes:

- Avoid static synchronized code in JVM class libraries for dealing with default timezones.
- Performance enhancement of initial character set configuration, driver will only send commands required to configure connection character set session variables if the current values on the server do not match what is required.
- Re-worked stored procedure parameter parser to be more robust. Driver no longer requires `BEGIN` in stored procedure definition, but does have requirement that if a stored function begins with a label directly after the "returns" clause, that the label is not a quoted identifier.
- Throw exceptions encountered during timeout to thread calling `Statement.execute*()`, rather than `RuntimeException`.
- Changed cached result set metadata (when using `cacheResultSetMetadata=true`) to be cached per-connection rather than per-statement as previously implemented.
- Reverted back to internal character conversion routines for single-byte character sets, as the ones internal to the JVM are using much more CPU time than our internal implementation.
- When extracting foreign key information from `SHOW CREATE TABLE` in `DatabaseMetaData`, ignore exceptions relating to tables being missing (which could happen for cross-reference or imported-key requests, as the list of tables is generated first, then iterated).
- Fixed some Null Pointer Exceptions (NPEs) when cached metadata was used with `UpdatableResultSets`.
- Take `localSocketAddress` property into account when creating instances of `CommunicationsException` when the underlying exception is a `java.net.BindException`, so that a friendlier error message is given with a little internal diagnostics.
- Fixed cases where `ServerPreparedStatements` weren't using cached metadata when `cacheResultSetMetadata=true` was used.
- Use a `java.util.TreeMap` to map column names to ordinal indexes for `ResultSet.findColumn()` instead of a `HashMap`. This allows us to have case-insensitive lookups (required by the JDBC specification) without resorting to the many transient object instances needed to support this requirement with a normal `HashMap` with either case-adjusted keys, or case-insensitive keys. (In the worst case scenario for lookups of a 1000 column result set, `TreeMaps` are about half as fast wall-clock time as a `HashMap`, however in normal applications their use gives many orders of magnitude reduction in transient object instance creation which pays off later for CPU usage in garbage collection).
- When using cached metadata, skip field-level metadata packets coming from the server, rather than reading them and discarding them without creating `com.mysql.jdbc.Field` instances.

E.6.2.5. Changes in MySQL Connector/J 5.0.4 (20 October 2006)

Bugs fixed:

- `DBMD.getColumns()` does not return expected `COLUMN_SIZE` for the SET type, now returns length of largest possible set disregarding whitespace or the "," delimiters to be consistent with the ODBC driver. (Bug#22613)
- Added new `_ci` collations to `CharsetMapping` - `utf8_unicode_ci` not working. (Bug#22456)
- Driver was using milliseconds for `Statement.setQueryTimeout()` when specification says argument is to be in seconds. (Bug#22359)
- Workaround for server crash when calling stored procedures via a server-side prepared statement (driver now detects prepare(stored procedure) and substitutes client-side prepared statement). (Bug#22297)
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). (Bug#22290)
- Newlines causing whitespace to span confuse procedure parser when getting parameter metadata for stored procedures. (Bug#22024)

- When using `information_schema` for metadata, `COLUMN_SIZE` for `getColumns()` is not clamped to range of `java.lang.Integer` as is the case when not using `information_schema`, thus leading to a truncation exception that isn't present when not using `information_schema`. (Bug#21544)
- Column names don't match metadata in cases where server doesn't return original column names (column functions) thus breaking compatibility with applications that expect 1-1 mappings between `findColumn()` and `rsmd.getColumnNames()`, usually manifests itself as "Can't find column ()" exceptions. (Bug#21379)
- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'.
- Fixed configuration property `jdbcCompliantTruncation` was not being used for reads of result set values.
- `DatabaseMetaData` correctly reports `true` for `supportsCatalog*` methods.
- Driver now supports `{call sp}` (without "()") if procedure has no arguments).

E.6.2.6. Changes in MySQL Connector/J 5.0.3 (26 July 2006)

Functionality added or changed:

- Added configuration option `noAccessToProcedureBodies` which will cause the driver to create basic parameter metadata for `CallableStatements` when the user does not have access to procedure bodies via `SHOW CREATE PROCEDURE` or selecting from `mysql.proc` instead of throwing an exception. The default value for this option is `false`

Bugs fixed:

- Fixed `Statement.cancel()` causes `NullPointerException` if underlying connection has been closed due to server failure. (Bug#20650)
- If the connection to the server has been closed due to a server failure, then the cleanup process will call `Statement.cancel()`, triggering a `NullPointerException`, even though there is no active connection. (Bug#20650)

E.6.2.7. Changes in MySQL Connector/J 5.0.2 (11 July 2006)

Bugs fixed:

- `MysqlXaConnection.recover(int flags)` now allows combinations of `XAResource.TMSTARTRSCAN` and `TMENDRSCAN`. To simulate the "scanning" nature of the interface, we return all prepared XIDs for `TMSTARTRSCAN`, and no new XIDs for calls with `TMNOFLAGS`, or `TMENDRSCAN` when not in combination with `TMSTARTRSCAN`. This change was made for API compliance, as well as integration with IBM WebSphere's transaction manager. (Bug#20242)
- Fixed `MysqlValidConnectionChecker` for JBoss doesn't work with `MySQLXADataSources`. (Bug#20242)
- Added connection/datasource property `pingGlobalTxToPhysicalConnection` (defaults to `false`). When set to `true`, when using `XAConnections`, the driver ensures that operations on a given XID are always routed to the same physical connection. This allows the `XAConnection` to support `XA START ... JOIN` after `XA END` has been called, and is also a workaround for transaction managers that don't maintain thread affinity for a global transaction (most either always maintain thread affinity, or have it as a configuration option). (Bug#20242)
- Better caching of character set converters (per-connection) to remove a bottleneck for multibyte character sets. (Bug#20242)
- Fixed `ConnectionProperties` (and thus some subclasses) are not serializable, even though some J2EE containers expect them to be. (Bug#19169)
- Fixed driver fails on non-ASCII platforms. The driver was assuming that the platform character set would be a superset of MySQL's `latin1` when doing the handshake for authentication, and when reading error messages. We now use Cp1252 for all strings sent to the server during the handshake phase, and a hard-coded mapping of the `language` system variable to the character set that is used for error messages. (Bug#18086)
- Fixed can't use `XAConnection` for local transactions when no global transaction is in progress. (Bug#17401)

E.6.2.8. Changes in MySQL Connector/J 5.0.1 (Not Released)

Not released due to a packaging error

E.6.2.9. Changes in MySQL Connector/J 5.0.0 (22 December 2005)

Bugs fixed:

- Added support for Connector/MXJ integration via url subprotocol `jdbc:mysql:mxj://...` (Bug#14729)
- Idle timeouts cause `XAConnections` to whine about rolling themselves back. (Bug#14729)
- When fix for Bug#14562 was merged from 3.1.12, added functionality for `CallableStatement`'s parameter metadata to return correct information for `.getParameterClassName()`. (Bug#14729)
- Added service-provider entry to `META-INF/services/java.sql.Driver` for JDBC-4.0 support. (Bug#14729)
- Fuller synchronization of `Connection` to avoid deadlocks when using multithreaded frameworks that multithread a single connection (usually not recommended, but the JDBC spec allows it anyways), part of fix to Bug#14972). (Bug#14729)
- Moved all `SQLException` constructor usage to a factory in `SQLException` (ground-work for JDBC-4.0 `SQLState`-based exception classes). (Bug#14729)
- Removed Java5-specific calls to `BigDecimal` constructor (when result set value is `'', (int)0` was being used as an argument indirectly via method return value. This signature doesn't exist prior to Java5.) (Bug#14729)
- Implementation of `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL-5.0.0 or newer server, require a separate connection to issue the `KILL QUERY` statement, and in the case of `setQueryTimeout()` creates an additional thread to handle the timeout functionality.

Note: Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeExceptions` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead. (Bug#14729)

- Return "[VAR]BINARY" for `RSMD.getColumnTypeName()` when that is actually the type, and it can be distinguished (MySQL-4.1 and newer). (Bug#14729)
- Attempt detection of the MySQL type `BINARY` (it's an alias, so this isn't always reliable), and use the `java.sql.Types.BINARY` type mapping for it.
- Added unit tests for `XADatasource`, as well as friendlier exceptions for XA failures compared to the "stock" `XAException` (which has no messages).
- If the connection `useTimezone` is set to `true`, then also respect time zone conversions in escape-processed string literals (for example, `"{ts ...}"` and `"{t ...}"`).
- Don't allow `.setAutoCommit(true)`, or `.commit()` or `.rollback()` on an XA-managed connection as per the JDBC specification.
- `XADatasource` implemented (ported from 3.2 branch which won't be released as a product). Use `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` as your datasource class name in your application server to utilize XA transactions in MySQL-5.0.10 and newer.
- Moved `-bin-g.jar` file into separate `debug` subdirectory to avoid confusion.
- Return original column name for `RSMD.getColumnLabel()` if the column was aliased, alias name for `.getColumnLabel()` (if aliased), and original table name for `.getTableName()`. Note this only works for MySQL-4.1 and newer, as older servers don't make this information available to clients.
- Setting `useJDBCCompliantTimezoneShift=true` (it's not the default) causes the driver to use GMT for *all* `TIMESTAMP/DATETIME` time zones, and the current VM time zone for any other type that refers to time zones. This feature can not be used when `useTimezone=true` to convert between server and client time zones.
- `PreparedStatement.setString()` didn't work correctly when `sql_mode` on server contained `NO_BACKSLASH_ESCAPES` and no characters that needed escaping were present in the string.
- Add one level of indirection of internal representation of `CallableStatement` parameter metadata to avoid class not found issues on JDK-1.3 for `ParameterMetadata` interface (which doesn't exist prior to JDBC-3.0).

E.6.3. Changes in MySQL Connector/J 3.1.x

E.6.3.1. Changes in MySQL Connector/J 3.1.15 (Not yet released)

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

Bugs fixed:

- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. (Bug #Bug#24840)

E.6.3.2. Changes in MySQL Connector/J 3.1.14 (10-19-2006)

Bugs fixed:

- Check and store value for `continueBatchOnError` property in constructor of `Statements`, rather than when executing batches, so that `Connections` closed out from underneath statements don't cause `NullPointerExceptions` when it's required to check this property. (Bug#22290)
- Fixed Bug#18258 - `DatabaseMetaData.getTables()`, `columns()` with bad catalog parameter threw exception rather than return empty result set (as required by spec). (Bug#22290)
- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'. (Bug#22290)
- Fixed bug where driver would not advance to next host if `roundRobinLoadBalance=true` and the last host in the list is down. (Bug#22290)
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). (Bug #Bug#22290)
- Fixed bug when calling stored functions, where parameters weren't numbered correctly (first parameter is now the return value, subsequent parameters if specified start at index "2"). (Bug#22290)
- Removed logger autodetection altogether, must now specify logger explicitly if you want to use a logger other than one that logs to `STDERR`. (Bug#21207)
- `DDriver` throws `NPE` when tracing prepared statements that have been closed (in `asSQL()`). (Bug#21207)
- `ResultSet.getSomeInteger()` doesn't work for `BIT(>1)`. (Bug#21062)
- Escape of quotes in client-side prepared statements parsing not respected. Patch covers more than bug report, including `NO_BACKSLASH_ESCAPES` being set, and stacked quote characters forms of escaping (that is, " or "). (Bug#20888)
- Fixed can't pool server-side prepared statements, exception raised when re-using them. (Bug#20687)
- Fixed `Updatable` result set that contains a `BIT` column fails when server-side prepared statements are used. (Bug#20485)
- Fixed `updatable` result set throws `ClassCastException` when there is row data and `moveToInsertRow()` is called. (Bug#20479)
- Fixed `ResultSet.getShort()` for `UNSIGNED TINYINT` returns incorrect values when using server-side prepared statements. (Bug#20306)
- `ReplicationDriver` does not always round-robin load balance depending on URL used for slaves list. (Bug#19993)
- Fixed calling `toString()` on `ResultSetMetaData` for driver-generated (that is, from `DatabaseMetaData` method calls, or from `GeneratedKeys()`) result sets would raise a `NullPointerException`. (Bug#19993)
- Connection fails to localhost when using timeout and IPv6 is configured. (Bug#19726)
- `ResultSet.getFloatFromString()` can't retrieve values near `Float.MIN/MAX_VALUE`. (Bug#18880)
- Fixed memory leak with `profileSQL=true`. (Bug#16987)
- Fixed `NullPointerException` in `MySQLDataSourceFactory` due to `Reference` containing `RefAddr`s with null content. (Bug#16791)

E.6.3.3. Changes in MySQL Connector/J 3.1.13 (26 May 2006)

Bugs fixed:

- Fixed `PreparedStatement.setObject(int, Object, int)` doesn't respect scale of `BigDecimal`s. (Bug#19615)
- Fixed `ResultSet.isNull()` returns incorrect value when extracting native string from server-side prepared statement generated result set. (Bug#19282)
- Fixed invalid classname returned for `ResultSetMetaData.getColumnClassName()` for `BIGINT` type. (Bug#19282)
- Fixed case where driver wasn't reading server status correctly when fetching server-side prepared statement rows, which in some cases could cause warning counts to be off, or multiple result sets to not be read off the wire. (Bug#19282)
- Fixed data truncation and `getWarnings()` only returns last warning in set. (Bug#18740)
- Fixed aliased column names where length of name > 251 are corrupted. (Bug#18554)
- Improved performance of retrieving `BigDecimal`, `Time`, `Timestamp` and `Date` values from server-side prepared statements by creating fewer short-lived instances of `Strings` when the native type is not an exact match for the requested type. (Bug#18496)
- Added performance feature, re-writing of batched executes for `Statement.executeBatch()` (for all DML statements) and `PreparedStatement.executeBatch()` (for INSERTs with VALUE clauses only). Enable by using "rewrite-BatchedStatements=true" in your JDBC URL. (Bug#18041)
- Fixed issue where server-side prepared statements don't cause truncation exceptions to be thrown when truncation happens. (Bug#18041)
- Fixed `CallableStatement.registerOutParameter()` not working when some parameters pre-populated. Still waiting for feedback from JDBC experts group to determine what correct parameter count from `getMetaData()` should be, however. (Bug#17898)
- Fixed calling `clearParameters()` on a closed prepared statement causes NPE. (Bug#17587)
- Map "latin1" on MySQL server to CP1252 for MySQL > 4.1.0. (Bug#17587)
- Added additional accessor and mutator methods on `ConnectionProperties` so that `DataSource` users can use same naming as regular URL properties. (Bug#17587)
- Fixed `ResultSet.isNull()` not always reset correctly for booleans when done via conversion for server-side prepared statements. (Bug#17450)
- Fixed `Statement.getGeneratedKeys()` throws `NullPointerException` when no query has been processed. (Bug#17099)
- Fixed updatable result set doesn't return `AUTO_INCREMENT` values for `insertRow()` when multiple column primary keys are used. (the driver was checking for the existence of single-column primary keys and an autoincrement value > 0 instead of a straightforward `isAutoIncrement()` check). (Bug#16841)
- `DBMD.getColumns()` returns wrong type for `BIT`. (Bug#15854)
- `lib-nodist` directory missing from package breaks out-of-box build. (Bug#15676)
- Fixed issue with `ReplicationConnection` incorrectly copying state, doesn't transfer connection context correctly when transitioning between the same read-only states. (Bug#15570)
- No "dos" character set in MySQL > 4.1.0. (Bug#15544)
- `INOUT` parameter does not store `IN` value. (Bug#15464)
- `PreparedStatement.setObject()` serializes `BigInteger` as object, rather than sending as numeric value (and is thus not complementary to `getObject()` on an `UNSIGNED LONG` type). (Bug#15383)
- Fixed issue where driver was unable to initialize character set mapping tables. Removed reliance on `.properties` files to hold this information, as it turns out to be too problematic to code around class loader hierarchies that change depending on how an application is deployed. Moved information back into the `CharsetMapping` class. (Bug#14938)

- Exception thrown for new decimal type when using updatable result sets. ([Bug#14609](#))
- Driver now aware of fix for `BIT` type metadata that went into MySQL-5.0.21 for server not reporting length consistently. ([Bug#13601](#))
- Added support for Apache Commons logging, use `"com.mysql.jdbc.log.CommonsLogger"` as the value for the `"logger"` configuration property. ([Bug#13469](#))
- Fixed driver trying to call methods that don't exist on older and newer versions of Log4j. The fix is not trying to auto-detect presence of log4j, too many different incompatible versions out there in the wild to do this reliably.

If you relied on autodetection before, you will need to add `"logger=com.mysql.jdbc.log.Log4JLogger"` to your JDBC URL to enable Log4J usage, or alternatively use the new `"CommonsLogger"` class to take care of this. ([Bug#13469](#))
- LogFactory now prepends `"com.mysql.jdbc.log"` to log class name if it can't be found as-specified. This allows you to use "short names" for the built-in log factories, for example `"logger=CommonsLogger"` instead of `"logger=com.mysql.jdbc.log.CommonsLogger"`. ([Bug#13469](#))
- `ResultSet.getShort()` for `UNSIGNED TINYINT` returned wrong values. ([Bug#11874](#))

E.6.3.4. Changes in MySQL Connector/J 3.1.12 (30 November 2005)

Bugs fixed:

- Process escape tokens in `Connection.prepareStatement(...)`. You can disable this behavior by setting the JDBC URL configuration property `processEscapeCodesForPrepStmts` to `false`. ([Bug#15141](#))
- Usage advisor complains about unreferenced columns, even though they've been referenced. ([Bug#15065](#))
- Driver incorrectly closes streams passed as arguments to `PreparedStatement`s. Reverts to legacy behavior by setting the JDBC configuration property `autoClosePStmtStreams` to `true` (also included in the 3-0-Compat configuration "bundle"). ([Bug#15024](#))
- Deadlock while closing server-side prepared statements from multiple threads sharing one connection. ([Bug#14972](#))
- Unable to initialize character set mapping tables (due to J2EE classloader differences). ([Bug#14938](#))
- Escape processor replaces quote character in quoted string with string delimiter. ([Bug#14909](#))
- `DatabaseMetaData.getColumns()` doesn't return `TABLE_NAME` correctly. ([Bug#14815](#))
- `storesMixedCaseIdentifiers()` returns `false` ([Bug#14562](#))
- `storesLowerCaseIdentifiers()` returns `true` ([Bug#14562](#))
- `storesMixedCaseQuotedIdentifiers()` returns `false` ([Bug#14562](#))
- `storesMixedCaseQuotedIdentifiers()` returns `true` ([Bug#14562](#))
- If `lower_case_table_names=0` (on server):
 - `storesLowerCaseIdentifiers()` returns `false`
 - `storesLowerCaseQuotedIdentifiers()` returns `false`
 - `storesMixedCaseIdentifiers()` returns `true`
 - `storesMixedCaseQuotedIdentifiers()` returns `true`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`([Bug#14562](#))
- `storesUpperCaseIdentifiers()` returns `false` ([Bug#14562](#))
- `storesUpperCaseQuotedIdentifiers()` returns `true` ([Bug#14562](#))
- If `lower_case_table_names=1` (on server):

- `storesLowerCaseIdentifiers()` returns `true`
 - `storesLowerCaseQuotedIdentifiers()` returns `true`
 - `storesMixedCaseIdentifiers()` returns `false`
 - `storesMixedCaseQuotedIdentifiers()` returns `false`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`
- (Bug#14562)
- `storesLowerCaseQuotedIdentifiers()` returns `true` (Bug#14562)
 - Fixed `DatabaseMetaData.stores*Identifiers()`:
 - If `lower_case_table_names=0` (on server):
 - `storesLowerCaseIdentifiers()` returns `false`
 - `storesLowerCaseQuotedIdentifiers()` returns `false`
 - `storesMixedCaseIdentifiers()` returns `true`
 - `storesMixedCaseQuotedIdentifiers()` returns `true`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`
 - If `lower_case_table_names=1` (on server):
 - `storesLowerCaseIdentifiers()` returns `true`
 - `storesLowerCaseQuotedIdentifiers()` returns `true`
 - `storesMixedCaseIdentifiers()` returns `false`
 - `storesMixedCaseQuotedIdentifiers()` returns `false`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`
- (Bug#14562)
- `storesMixedCaseIdentifiers()` returns `true` (Bug#14562)
 - `storesLowerCaseQuotedIdentifiers()` returns `false` (Bug#14562)
 - Java type conversion may be incorrect for `MEDIUMINT`. (Bug#14562)
 - `storesLowerCaseIdentifiers()` returns `false` (Bug#14562)
 - Added configuration property `useGmtMillisForDatetimes` which when set to `true` causes `ResultSet.getDate()`, `ResultSet.getTimestamp()` to return correct millis-since GMT when `ResultSet.getTime()` is called on the return value (currently default is `false` for legacy behavior). (Bug#14562)
 - Extraneous sleep on `autoReconnect`. (Bug#13775)
 - Reconnect during middle of `executeBatch()` should not occur if `autoReconnect` is enabled. (Bug#13255)
 - `maxQuerySizeToLog` is not respected. Added logging of bound values for `execute()` phase of server-side prepared statements when `profileSQL=true` as well. (Bug#13048)
 - OpenOffice expects `DBMD.supportsIntegrityEnhancementFacility()` to return `true` if foreign keys are supported by the datasource, even though this method also covers support for check constraints, which MySQL *doesn't* have. Setting the configuration property `overrideSupportsIntegrityEnhancementFacility` to `true` causes the driver to return `true` for this method. (Bug#12975)
-

- Added `com.mysql.jdbc.testsuite.url.default` system property to set default JDBC url for testsuite (to speed up bug resolution when I'm working in Eclipse). (Bug#12975)
- `logSlowQueries` should give better info. (Bug#12230)
- Don't increase timeout for failover/reconnect. (Bug#6577)
- Fixed client-side prepared statement bug with embedded `?` characters inside quoted identifiers (it was recognized as a placeholder, when it was not).
- Don't allow `executeBatch()` for `CallableStatements` with registered `OUT/INOUT` parameters (JDBC compliance).
- Fall back to platform-encoding for `URLDecoder.decode()` when parsing driver URL properties if the platform doesn't have a two-argument version of this method.

E.6.3.5. Changes in MySQL Connector/J 3.1.11 (07 October 2005)

Bugs fixed:

- The configuration property `sessionVariables` now allows you to specify variables that start with the “@” sign. (Bug#13453)
- URL configuration parameters don't allow “&” or “=” in their values. The JDBC driver now parses configuration parameters as if they are encoded using the application/x-www-form-urlencoded format as specified by `java.net.URLDecoder` (<http://java.sun.com/j2se/1.5.0/docs/api/java/net/URLDecoder.html>).
If the “%” character is present in a configuration property, it must now be represented as `%25`, which is the encoded form of “%” when using application/x-www-form-urlencoded encoding. (Bug#13453)
- Workaround for Bug#13374: `ResultSet.getStatement()` on closed result set returns `NULL` (as per JDBC 4.0 spec, but not backward-compatible). Set the connection property `retainStatementAfterResultSetClose` to `true` to be able to retrieve a `ResultSet`'s statement after the `ResultSet` has been closed via `.getStatement()` (the default is `false`, to be JDBC-compliant and to reduce the chance that code using JDBC leaks `Statement` instances). (Bug#13277)
- `ResultSetMetaData` from `Statement.getGeneratedKeys()` caused a `NullPointerException` to be thrown whenever a method that requires a connection reference was called. (Bug#13277)
- Backport of `VAR[BINARY|CHAR] [BINARY]` types detection from 5.0 branch. (Bug#13277)
- Fixed `NullPointerException` when converting `catalog` parameter in many `DatabaseMetaDataMethods` to `byte[]`s (for the result set) when the parameter is `null`. (`null` isn't technically allowed by the JDBC specification, but we've historically allowed it). (Bug#13277)
- Backport of `Field` class, `ResultSetMetaData.getColumnClassName()`, and `ResultSet.getObject(int)` changes from 5.0 branch to fix behavior surrounding `VARCHAR BINARY/VARBINARY` and related types. (Bug#13277)
- Read response in `MysqlIO.sendFileToServer()`, even if the local file can't be opened, otherwise next query issued will fail, because it's reading the response to the empty `LOAD DATA INFILE` packet sent to the server. (Bug#13277)
- When `gatherPerfMetrics` is enabled for servers older than 4.1.0, a `NullPointerException` is thrown from the constructor of `ResultSet` if the query doesn't use any tables. (Bug#13043)
- `java.sql.Types.OTHER` returned for `BINARY` and `VARBINARY` columns when using `DatabaseMetaData.getColumns()`. (Bug#12970)
- `ServerPreparedStatement.getBinding()` now checks if the statement is closed before attempting to reference the list of parameter bindings, to avoid throwing a `NullPointerException`. (Bug#12970)
- Tokenizer for `=` in URL properties was causing `sessionVariables=...` to be parameterized incorrectly. (Bug#12753)
- `cp1251` incorrectly mapped to `win1251` for servers newer than 4.0.x. (Bug#12752)
- `getExportedKeys()` (Bug#12541)
- Specifying a catalog works as stated in the API docs. (Bug#12541)
- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties. (Bug#12541)

- `getIndexInfo()` ([Bug#12541](#))
- `getProcedures()` (and thus indirectly `getProcedureColumns()`) ([Bug#12541](#))
- `getImportedKeys()` ([Bug#12541](#))
- Specifying "" means “current” catalog, even though this isn't quite JDBC spec compliant, it's there for legacy users. ([Bug#12541](#))
- `getCrossReference()` ([Bug#12541](#))
- Added `Connection.isMasterConnection()` for clients to be able to determine if a multi-host master/slave connection is connected to the first host in the list. ([Bug#12541](#))
- `getColumns()` ([Bug#12541](#))
- Handling of catalog argument in `DatabaseMetaData.getIndexInfo()`, which also means changes to the following methods in `DatabaseMetaData`:
 - `getBestRowIdentifier()`
 - `getColumns()`
 - `getCrossReference()`
 - `getExportedKeys()`
 - `getImportedKeys()`
 - `getIndexInfo()`
 - `getPrimaryKeys()`
 - `getProcedures()` (and thus indirectly `getProcedureColumns()`)
 - `getTables()`

The `catalog` argument in all of these methods now behaves in the following way:

 - Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties.
 - Specifying "" means “current” catalog, even though this isn't quite JDBC spec compliant, it's there for legacy users.
 - Specifying a catalog works as stated in the API docs.
 - Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances). ([Bug#12541](#))
- `getBestRowIdentifier()` ([Bug#12541](#))
- Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances). ([Bug#12541](#))
- `getTables()` ([Bug#12541](#))
- `getPrimaryKeys()` ([Bug#12541](#))
- `Connection.prepareCall()` is database name case-sensitive (on Windows systems). ([Bug#12417](#))
- `explainSlowQueries` hangs with server-side prepared statements. ([Bug#12229](#))
- Properties shared between master and slave with replication connection. ([Bug#12218](#))
- Geometry types not handled with server-side prepared statements. ([Bug#12104](#))
- `maxPerformance.properties` mis-spells “elideSetAutoCommits”. ([Bug#11976](#))
- `ReplicationConnection` won't switch to slave, throws “Catalog can't be null” exception. ([Bug#11879](#))

- `Pstmt.setObject(..., Types.BOOLEAN)` throws exception. (Bug#11798)
- Escape tokenizer doesn't respect stacked single quotes for escapes. (Bug#11797)
- `GEOMETRY` type not recognized when using server-side prepared statements. (Bug#11797)
- Foreign key information that is quoted is parsed incorrectly when `DatabaseMetaData` methods use that information. (Bug#11781)
- The `sendBlobChunkSize` property is now clamped to `max_allowed_packet` with consideration of stream buffer size and packet headers to avoid `PacketTooBigExceptions` when `max_allowed_packet` is similar in size to the default `sendBlobChunkSize` which is 1M. (Bug#11781)
- `CallableStatement.clearParameters()` now clears resources associated with `INOUT/OUTPUT` parameters as well as `INPUT` parameters. (Bug#11781)
- Fixed regression caused by fix for Bug#11552 that caused driver to return incorrect values for unsigned integers when those integers were within the range of the positive signed type. (Bug#11663)
- Moved source code to Subversion repository. (Bug#11663)
- Incorrect generation of testcase scripts for server-side prepared statements. (Bug#11663)
- Fixed statements generated for testcases missing `;` for "plain" statements. (Bug#11629)
- Spurious `!` on console when character encoding is `utf8`. (Bug#11629)
- `StringUtils.getBytes()` doesn't work when using multi-byte character encodings and a length in *characters* is specified. (Bug#11614)
- `DBMD.storesLower/Mixed/UpperIdentifiers()` reports incorrect values for servers deployed on Windows. (Bug#11575)
- Reworked `Field` class, `*Buffer`, and `MySQLIO` to be aware of field lengths $> Integer.MAX_VALUE$. (Bug#11498)
- Escape processor didn't honor strings demarcated with double quotes. (Bug#11498)
- Updated `DBMD.supportsCorrelatedQueries()` to return `true` for versions > 4.1 , `supportsGroupByUnrelated()` to return `true` and `getResultSetHoldability()` to return `HOLD_CURSORS_OVER_COMMIT`. (Bug#11498)
- Lifted restriction of changing streaming parameters with server-side prepared statements. As long as *all* streaming parameters were set before execution, `.clearParameters()` does not have to be called. (due to limitation of client/server protocol, prepared statements can not reset *individual* stream data on the server side). (Bug#11498)
- `ResultSet.moveToCurrentRow()` fails to work when preceded by a call to `ResultSet.moveToInsertRow()`. (Bug#11190)
- `VARBINARY` data corrupted when using server-side prepared statements and `.setBytes()`. (Bug#11115)
- `Statement.getWarnings()` fails with NPE if statement has been closed. (Bug#10630)
- Only get `char[]` from SQL in `PreparedStatement.ParseInfo()` when needed. (Bug#10630)

E.6.3.6. Changes in MySQL Connector/J 3.1.10 (23 June 2005)

Bugs fixed:

- Initial implementation of `ParameterMetadata` for `PreparedStatement.getParameterMetadata()`. Only works fully for `CallableStatements`, as current server-side prepared statements return every parameter as a `VARCHAR` type.
- Fixed connecting without a database specified raised an exception in `MySQLIO.changeDatabaseTo()`.

E.6.3.7. Changes in MySQL Connector/J 3.1.9 (22 June 2005)

Bugs fixed:

- Production package doesn't include JBoss integration classes. (Bug#11411)
- Removed nonsensical “costly type conversion” warnings when using usage advisor. (Bug#11411)
- Fixed `PreparedStatement.setClob()` not accepting `null` as a parameter. (Bug#11360)
- Connector/J dumping query into `SQLException` twice. (Bug#11360)
- `autoReconnect` ping causes exception on connection startup. (Bug#11259)
- `Connection.setCatalog()` is now aware of the `useLocalSessionState` configuration property, which when set to `true` will prevent the driver from sending `USE ...` to the server if the requested catalog is the same as the current catalog. (Bug#11115)
- `3-0-Compat` — Compatibility with Connector/J 3.0.x functionality (Bug#11115)
- `maxPerformance` — maximum performance without being reckless (Bug#11115)
- `solarisMaxPerformance` — maximum performance for Solaris, avoids syscalls where it can (Bug#11115)
- Added `maintainTimeStats` configuration property (defaults to `true`), which tells the driver whether or not to keep track of the last query time and the last successful packet sent to the server's time. If set to `false`, removes two syscalls per query. (Bug#11115)
- `VARBINARY` data corrupted when using server-side prepared statements and `ResultSet.getBytes()`. (Bug#11115)
- Added the following configuration bundles, use one or many via the `useConfigs` configuration property:
 - `maxPerformance` — maximum performance without being reckless
 - `solarisMaxPerformance` — maximum performance for Solaris, avoids syscalls where it can
 - `3-0-Compat` — Compatibility with Connector/J 3.0.x functionality(Bug#11115)
- Try to handle `OutOfMemoryErrors` more gracefully. Although not much can be done, they will in most cases close the connection they happened on so that further operations don't run into a connection in some unknown state. When an OOM has happened, any further operations on the connection will fail with a “Connection closed” exception that will also list the OOM exception as the reason for the implicit connection close event. (Bug#10850)
- Setting `cachePrepStmts=true` now causes the `Connection` to also cache the check the driver performs to determine if a prepared statement can be server-side or not, as well as caches server-side prepared statements for the lifetime of a connection. As before, the `prepStmtCacheSize` parameter controls the size of these caches. (Bug#10850)
- Don't send `COM_RESET_STMT` for each execution of a server-side prepared statement if it isn't required. (Bug#10850)
- 0-length streams not sent to server when using server-side prepared statements. (Bug#10850)
- Driver detects if you're running MySQL-5.0.7 or later, and does not scan for `LIMIT ?[,?]` in statements being prepared, as the server supports those types of queries now. (Bug#10850)
- Reorganized directory layout. Sources now are in `src` folder. Don't pollute parent directory when building, now output goes to `./build`, distribution goes to `./dist`. (Bug#10496)
- Added support/bug hunting feature that generates `.sql` test scripts to `STDERR` when `autoGenerateTestcaseScript` is set to `true`. (Bug#10496)
- `SQLException` is thrown when using property `characterSetResults` with `cp932` or `eucljms`. (Bug#10496)
- The datatype returned for `TINYINT(1)` columns when `tinyIntIsBit=true` (the default) can be switched between `Types.BOOLEAN` and `Types.BIT` using the new configuration property `transformedBitIsBoolean`, which defaults to `false`. If set to `false` (the default), `DatabaseMetaData.getColumns()` and `ResultSetMetaData.getColumnType()` will return `Types.BOOLEAN` for `TINYINT(1)` columns. If `true`, `Types.BOOLEAN` will be returned instead. Regardless of this configuration property, if `tinyIntIsBit` is enabled, columns with the type `TINYINT(1)` will be returned as `java.lang.Boolean` instances from `ResultSet.getObject(...)`, and `ResultSetMetaData.getColumnClassName()` will return `java.lang.Boolean`. (Bug#10485)
- `SQLException` thrown when retrieving `YEAR(2)` with `ResultSet.getString()`. The driver will now always treat `YEAR` types as `java.sql.Dates` and return the correct values for `getString()`. Alternatively, the `yearIsDateType` connection property can be set to `false` and the values will be treated as `SHORTs`. (Bug#10485)

- Driver doesn't support `{?=CALL(. . .)}` for calling stored functions. This involved adding support for function retrieval to `DatabaseMetaData.getProcedures()` and `getProcedureColumns()` as well. (Bug#10310)
- Unsigned `SMALLINT` treated as signed for `ResultSet.getInt()`, fixed all cases for `UNSIGNED` integer values and server-side prepared statements, as well as `ResultSet.getObject()` for `UNSIGNED TINYINT`. (Bug#10156)
- Made `ServerPreparedStatement.asSql()` work correctly so auto-explain functionality would work with server-side prepared statements. (Bug#10155)
- Double quotes not recognized when parsing client-side prepared statements. (Bug#10155)
- Made JDBC2-compliant wrappers public in order to allow access to vendor extensions. (Bug#10155)
- `DatabaseMetaData.supportsMultipleOpenResults()` now returns `true`. The driver has supported this for some time, DBMD just missed that fact. (Bug#10155)
- Cleaned up logging of profiler events, moved code to dump a profiler event as a string to `com.mysql.jdbc.log.LogUtils` so that third parties can use it. (Bug#10155)
- Made `enableStreamingResults()` visible on `com.mysql.jdbc.jdbc2.optional.StatementWrapper`. (Bug#10155)
- Actually write manifest file to correct place so it ends up in the binary jar file. (Bug#10144)
- Added `createDatabaseIfNotExist` property (default is `false`), which will cause the driver to ask the server to create the database specified in the URL if it doesn't exist. You must have the appropriate privileges for database creation for this to work. (Bug#10144)
- Memory leak in `ServerPreparedStatement` if `serverPrepare()` fails. (Bug#10144)
- `com.mysql.jdbc.PreparedStatement.ParseInfo` does unnecessary call to `toCharArray()`. (Bug#9064)
- Driver now correctly uses CP932 if available on the server for Windows-31J, CP932 and MS932 java encoding names, otherwise it resorts to SJIS, which is only a close approximation. Currently only MySQL-5.0.3 and newer (and MySQL-4.1.12 or .13, depending on when the character set gets backported) can reliably support any variant of CP932.
- Overhaul of character set configuration, everything now lives in a properties file.

E.6.3.8. Changes in MySQL Connector/J 3.1.8 (14 April 2005)

Bugs fixed:

- Should accept `null` for catalog (meaning use current) in DBMD methods, even though it's not JDBC-compliant for legacy's sake. Disable by setting connection property `nullCatalogMeansCurrent` to `false` (which will be the default value in C/J 3.2.x). (Bug#9917)
- Fixed driver not returning `true` for `-1` when `ResultSet.getBoolean()` was called on result sets returned from server-side prepared statements. (Bug#9778)
- Added a `Manifest.MF` file with implementation information to the `.jar` file. (Bug#9778)
- More tests in `Field.isOpaqueBinary()` to distinguish opaque binary (that is, fields with type `CHAR(n)` and `CHARACTER SET BINARY`) from output of various scalar and aggregate functions that return strings. (Bug#9778)
- `DBMD.getTables()` shouldn't return tables if views are asked for, even if the database version doesn't support views. (Bug#9778)
- Should accept `null` for name patterns in DBMD (meaning “%”), even though it isn't JDBC compliant, for legacy's sake. Disable by setting connection property `nullNamePatternMatchesAll` to `false` (which will be the default value in C/J 3.2.x). (Bug#9769)
- Then fallback to our `STDERR` logging. (Bug#9704)
- The performance metrics feature now gathers information about number of tables referenced in a SELECT. (Bug#9704)
- The logging system is now automatically configured. If the value has been set by the user, via the URL property `logger` or the system property `com.mysql.jdbc.logger`, then use that, otherwise, autodetect it using the following steps:
 1. Log4j, if it's available,

2. Then JDK1.4 logging,
 3. Then fallback to our `STDERR` logging.
([Bug#9704](#))
- Then JDK1.4 logging, ([Bug#9704](#))
 - Log4j, if it's available, ([Bug#9704](#))
 - `Statement.getMoreResults()` could throw NPE when existing result set was `.close()`d. ([Bug#9704](#))
 - Stored procedures with `DECIMAL` parameters with storage specifications that contained “,” in them would fail. ([Bug#9682](#))
 - `PreparedStatement.setObject(int, Object, int type, int scale)` now uses scale value for `BigDecimal` instances. ([Bug#9682](#))
 - Added support for the c3p0 connection pool's (<http://c3p0.sf.net/>) validation/connection checker interface which uses the lightweight `COM_PING` call to the server if available. To use it, configure your c3p0 connection pool's `connectionTesterClassName` property to use `com.mysql.jdbc.integration.c3p0.MySqlConnectionTester`. ([Bug#9320](#))
 - `PreparedStatement.getMetaData()` inserts blank row in database under certain conditions when not using server-side prepared statements. ([Bug#9320](#))
 - Better detection of `LIMIT` inside/outside of quoted strings so that the driver can more correctly determine whether a prepared statement can be prepared on the server or not. ([Bug#9320](#))
 - `Connection.canHandleAsPreparedStatement()` now makes “best effort” to distinguish `LIMIT` clauses with placeholders in them from ones without in order to have fewer false positives when generating work-arounds for statements the server cannot currently handle as server-side prepared statements. ([Bug#9320](#))
 - Fixed `build.xml` to not compile `log4j` logging if `log4j` not available. ([Bug#9320](#))
 - Added finalizers to `ResultSet` and `Statement` implementations to be JDBC spec-compliant, which requires that if not explicitly closed, these resources should be closed upon garbage collection. ([Bug#9319](#))
 - Stored procedures with same name in different databases confuse the driver when it tries to determine parameter counts/types. ([Bug#9319](#))
 - A continuation of [Bug#8868](#), where functions used in queries that should return non-string types when resolved by temporary tables suddenly become opaque binary strings (work-around for server limitation). Also fixed fields with type of `CHAR(n)` `CHARACTER SET BINARY` to return correct/matching classes for `RSMD.getColumnClassName()` and `ResultSet.getObject()`. ([Bug#9236](#))
 - Cannot use `UTF-8` for `characterSetResults` configuration property. ([Bug#9206](#))
 - `PreparedStatement.addBatch()` doesn't work with server-side prepared statements and streaming `BINARY` data. ([Bug#9040](#))
 - `ServerPreparedStatements` now correctly “stream” `BLOB/CLOB` data to the server. You can configure the threshold chunk size using the JDBC URL property `blobSendChunkSize` (the default is 1MB). ([Bug#8868](#))
 - `DATE_FORMAT()` queries returned as `BLOBs` from `getObject()`. ([Bug#8868](#))
 - Server-side session variables can be preset at connection time by passing them as a comma-delimited list for the connection property `sessionVariables`. ([Bug#8868](#))
 - `BlobFromLocator` now uses correct identifier quoting when generating prepared statements. ([Bug#8868](#))
 - Fixed regression in `ping()` for users using `autoReconnect=true`. ([Bug#8868](#))
 - Check for empty strings (' ') when converting `CHAR/VARCHAR` column data to numbers, throw exception if `emptyStringsConvertToZero` configuration property is set to `false` (for backward-compatibility with 3.0, it is now set to `true` by default, but will most likely default to `false` in 3.2). ([Bug#8803](#))
 - `DATA_TYPE` column from `DBMD.getBestRowIdentifier()` causes `ArrayIndexOutOfBoundsException` when accessed (and in fact, didn't return any value). ([Bug#8803](#))
 - `DBMD.supportsMixedCase*Identifiers()` returns wrong value on servers running on case-sensitive filesystems. ([Bug#8800](#))

- `DBMD.supportsResultSetConcurrency()` not returning `true` for forward-only/read-only result sets (we obviously support this). (Bug#8792)
- Fixed `ResultSet.getTime()` on a `NULL` value for server-side prepared statements throws NPE.
- Made `Connection.ping()` a public method.
- Added support for new precision-math `DECIMAL` type in MySQL 5.0.3 and up.
- Fixed `DatabaseMetaData.getTables()` returning views when they were not asked for as one of the requested table types.

E.6.3.9. Changes in MySQL Connector/J 3.1.7 (18 February 2005)

Bugs fixed:

- `PreparedStatement` not creating streaming result sets. (Bug#8487)
- Don't pass `NULL` to `String.valueOf()` in `ResultSet.getNativeConvertToString()`, as it stringifies it (that is, returns `null`), which is not correct for the method in question. (Bug#8487)
- Fixed NPE in `ResultSet.realClose()` when using usage advisor and result set was already closed. (Bug#8428)
- `ResultSet.getString()` doesn't maintain format stored on server, bug fix only enabled when `noDatetimeStringSync` property is set to `true` (the default is `false`). (Bug#8428)
- Added support for `BIT` type in MySQL-5.0.3. The driver will treat `BIT(1-8)` as the JDBC standard `BIT` type (which maps to `java.lang.Boolean`), as the server does not currently send enough information to determine the size of a bitfield when `< 9` bits are declared. `BIT(>9)` will be treated as `VARBINARY`, and will return `byte[]` when `getObject()` is called. (Bug#8424)
- Added `useLocalSessionState` configuration property, when set to `true` the JDBC driver trusts that the application is well-behaved and only sets autocommit and transaction isolation levels using the methods provided on `java.sql.Connection`, and therefore can manipulate these values in many cases without incurring round-trips to the database server. (Bug#8424)
- Added `enableStreamingResults()` to `Statement` for connection pool implementations that check `Statement.setFetchSize()` for specification-compliant values. Call `Statement.setFetchSize(>=0)` to disable the streaming results for that statement. (Bug#8424)
- `ResultSet.getBigDecimal()` throws exception when rounding would need to occur to set scale. The driver now chooses a rounding mode of “half up” if non-rounding `BigDecimal.setScale()` fails. (Bug#8424)
- Fixed synchronization issue with `ServerPreparedStatement.serverPrepare()` that could cause deadlocks/crashes if connection was shared between threads. (Bug#8096)
- Emulated locators corrupt binary data when using server-side prepared statements. (Bug#8096)
- Infinite recursion when “falling back” to master in failover configuration. (Bug#7952)
- Disable multi-statements (if enabled) for MySQL-4.1 versions prior to version 4.1.10 if the query cache is enabled, as the server returns wrong results in this configuration. (Bug#7952)
- Removed `dontUnpackBinaryResults` functionality, the driver now always stores results from server-side prepared statements as is from the server and unpacks them on demand. (Bug#7952)
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug#7952)
- Added `holdResultsOpenOverStatementClose` property (default is `false`), that keeps result sets open over `statement.close()` or new execution on same statement (suggested by Kevin Burton). (Bug#7715)
- Detect new `sql_mode` variable in string form (it used to be integer) and adjust quoting method for strings appropriately. (Bug#7715)
- Timestamps converted incorrectly to strings with server-side prepared statements and updatable result sets. (Bug#7715)
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug#7686)

- Choose correct “direction” to apply time adjustments when both client and server are in GMT time zone when using `ResultSet.get(..., cal)` and `PreparedStatement.set(..., cal)`. (Bug#4718)
- Remove `_binary` introducer from parameters used as in/out parameters in `CallableStatement`. (Bug#4718)
- Always return `byte[]`s for output parameters registered as `*BINARY`. (Bug#4718)
- By default, the driver now scans SQL you are preparing via all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this by passing `emulateUnsupportedPstmts=false` in your JDBC URL. (Bug#4718)
- Added `dontTrackOpenResources` option (default is `false`, to be JDBC compliant), which helps with memory use for non-well-behaved apps (that is, applications that don't close `Statement` objects when they should). (Bug#4718)
- Send correct value for “boolean” `true` to server for `PreparedStatement.setObject(n, "true", Types.BIT)`. (Bug#4718)
- Fixed bug with `Connection` not caching statements from `prepareStatement()` when the statement wasn't a server-side prepared statement. (Bug#4718)

E.6.3.10. Changes in MySQL Connector/J 3.1.6 (23 December 2004)

Bugs fixed:

- `DBMD.getProcedures()` doesn't respect catalog parameter. (Bug#7026)
- Fixed hang on `SocketInputStream.read()` with `Statement.setMaxRows()` and multiple result sets when driver has to truncate result set directly, rather than tacking a `LIMIT n` on the end of it.

E.6.3.11. Changes in MySQL Connector/J 3.1.5 (02 December 2004)

Bugs fixed:

- Use 1MB packet for sending file for `LOAD DATA LOCAL INFILE` if that is `< max_allowed_packet` on server. (Bug#6537)
- `SUM()` on `DECIMAL` with server-side prepared statement ignores scale if zero-padding is needed (this ends up being due to conversion to `DOUBLE` by server, which when converted to a string to parse into `BigDecimal`, loses all “padding” zeros). (Bug#6537)
- Use `DatabaseMetaData.getIdentifierQuoteString()` when building DBMD queries. (Bug#6537)
- Use our own implementation of buffered input streams to get around blocking behavior of `java.io.BufferedInputStream`. Disable this with `useReadAheadInput=false`. (Bug#6399)
- Make auto-deserialization of `java.lang.Objects` stored in BLOB columns configurable via `autoDeserialize` property (defaults to `false`). (Bug#6399)
- `ResultSetMetaData.getColumnDisplaySize()` returns incorrect values for multi-byte charsets. (Bug#6399)
- Re-work `Field.isOpaqueBinary()` to detect `CHAR(n) CHARACTER SET BINARY` to support fixed-length binary fields for `ResultSet.getObject()`. (Bug#6399)
- Failing to connect to the server when one of the addresses for the given host name is IPV6 (which the server does not yet bind on). The driver now loops through *all* IP addresses for a given host, and stops on the first one that `accepts()` a `socket.connect()`. (Bug#6348)
- Removed unwanted new `Throwable()` in `ResultSet` constructor due to bad merge (caused a new object instance that was never used for every result set created). Found while profiling for Bug#6359. (Bug#6225)
- `ServerSidePreparedStatement` allocating short-lived objects unnecessarily. (Bug#6225)
- Use null-safe-equals for key comparisons in updatable result sets. (Bug#6225)
- Fixed too-early creation of `StringBuffer` in `EscapeProcessor.escapeSQL()`, also return `String` when escaping not needed (to avoid unnecessary object allocations). Found while profiling for Bug#6359. (Bug#6225)

- `UNSIGNED BIGINT` unpacked incorrectly from server-side prepared statement result sets. (Bug#5729)
- Added experimental configuration property `dontUnpackBinaryResults`, which delays unpacking binary result set values until they're asked for, and only creates object instances for non-numerical values (it is set to `false` by default). For some usecase/jvm combinations, this is friendlier on the garbage collector. (Bug#5706)
- Don't throw exceptions for `Connection.releaseSavepoint()`. (Bug#5706)
- Inefficient detection of pre-existing string instances in `ResultSet.getNativeString()`. (Bug#5706)
- Use a per-session `Calendar` instance by default when decoding dates from `ServerPreparedStatements` (set to old, less performant behavior by setting property `dynamicCalendars=true`). (Bug#5706)
- Fixed batched updates with server prepared statements weren't looking if the types had changed for a given batched set of parameters compared to the previous set, causing the server to return the error "Wrong arguments to mysql_stmt_execute()". (Bug#5235)
- Handle case when string representation of timestamp contains trailing "." with no numbers following it. (Bug#5235)
- Server-side prepared statements did not honor `zeroDateTimeBehavior` property, and would cause class-cast exceptions when using `ResultSet.getObject()`, as the all-zero string was always returned. (Bug#5235)
- Fix comparisons made between string constants and dynamic strings that are converted with either `toUpperCase()` or `toLowerCase()` to use `Locale.ENGLISH`, as some locales "override" case rules for English. Also use `StringUtils.indexOfIgnoreCase()` instead of `.toUpperCase().indexOf()`, avoids creating a very short-lived transient `String` instance.

E.6.3.12. Changes in MySQL Connector/J 3.1.4 (04 September 2004)

Bugs fixed:

- Fixed `ServerPreparedStatement` to read prepared statement metadata off the wire, even though it's currently a placeholder instead of using `MySQLIO.clearInputStream()` which didn't work at various times because data wasn't available to read from the server yet. This fixes sporadic errors users were having with `ServerPreparedStatements` throwing `ArrayIndexOutOfBoundsException`. (Bug#5032)
- Added three ways to deal with all-zero datetimes when reading them from a `ResultSet`: `exception` (the default), which throws an `SQLException` with an SQLState of `S1009`; `convertToNull`, which returns `NULL` instead of the date; and `round`, which rounds the date to the nearest closest value which is `'0001-01-01'`. (Bug#5032)
- The driver is more strict about truncation of numerics on `ResultSet.get*()`, and will throw an `SQLException` when truncation is detected. You can disable this by setting `jdbcCompliantTruncation` to `false` (it is enabled by default, as this functionality is required for JDBC compliance). (Bug#5032)
- You can now use URLs in `LOAD DATA LOCAL INFILE` statements, and the driver will use Java's built-in handlers for retrieving the data and sending it to the server. This feature is not enabled by default, you must set the `allowUrlInLocalInfile` connection property to `true`. (Bug#5032)
- `ResultSet.getObject()` doesn't return type `Boolean` for pseudo-bit types from prepared statements on 4.1.x (shortcut for avoiding extra type conversion when using binary-encoded result sets obscured test in `getObject()` for "pseudo" bit type). (Bug#5032)
- Use `com.mysql.jdbc.Message`'s classloader when loading resource bundle, should fix sporadic issues when the caller's classloader can't locate the resource bundle. (Bug#5032)
- `ServerPreparedStatements` dealing with return of `DECIMAL` type don't work. (Bug#5012)
- Track packet sequence numbers if `enablePacketDebug=true`, and throw an exception if packets received out-of-order. (Bug#4689)
- `ResultSet.wasNull()` does not work for primitives if a previous `null` was returned. (Bug#4689)
- Optimized integer number parsing, enable "old" slower integer parsing using JDK classes via `useFastIntParsing=false` property. (Bug#4642)
- Added `useOnlyServerErrorMessages` property, which causes message text in exceptions generated by the server to only contain the text sent by the server (as opposed to the `SQLState`'s "standard" description, followed by the server's error message). This property is set to `true` by default. (Bug#4642)

- `ServerPreparedStatement.execute*()` sometimes threw `ArrayIndexOutOfBoundsException` when unpacking field metadata. (Bug#4642)
- Connector/J 3.1.3 beta does not handle integers correctly (caused by changes to support unsigned reads in `Buffer.readInt()` -> `Buffer.readShort()`). (Bug#4510)
- Added support in `DatabaseMetaData.getTables()` and `getTableTypes()` for views, which are now available in MySQL server 5.0.x. (Bug#4510)
- `ResultSet.getObject()` returns wrong type for strings when using prepared statements. (Bug#4482)
- Calling `MysqlPooledConnection.close()` twice (even though an application error), caused NPE. Fixed. (Bug#4482)

E.6.3.13. Changes in MySQL Connector/J 3.1.3 (07 July 2004)

Bugs fixed:

- Support new time zone variables in MySQL-4.1.3 when `useTimezone=true`. (Bug#4311)
- Error in retrieval of `mediumint` column with prepared statements and binary protocol. (Bug#4311)
- Support for unsigned numerics as return types from prepared statements. This also causes a change in `ResultSet.getObject()` for the `bigint unsigned` type, which used to return `BigDecimal` instances, it now returns instances of `java.lang.BigInteger`. (Bug#4311)
- Externalized more messages (on-going effort). (Bug#4119)
- Null bitmask sent for server-side prepared statements was incorrect. (Bug#4119)
- Added constants for MySQL error numbers (publicly accessible, see `com.mysql.jdbc.MysqlErrorNumbers`), and the ability to generate the mappings of vendor error codes to `SQLStates` that the driver uses (for documentation purposes). (Bug#4119)
- Added packet debugging code (see the `enablePacketDebug` property documentation). (Bug#4119)
- Use SQL Standard SQL states by default, unless `useSqlStateCodes` property is set to `false`. (Bug#4119)
- Mangle output parameter names for `CallableStatements` so they will not clash with user variable names.
- Added support for `INOUT` parameters in `CallableStatements`.

E.6.3.14. Changes in MySQL Connector/J 3.1.2 (09 June 2004)

Bugs fixed:

- Don't enable server-side prepared statements for server version 5.0.0 or 5.0.1, as they aren't compatible with the '4.1.2+' style that the driver uses (the driver expects information to come back that isn't there, so it hangs). (Bug#3804)
- `getWarnings()` returns `SQLWarning` instead of `DataTruncation`. (Bug#3804)
- `getProcedureColumns()` doesn't work with wildcards for procedure name. (Bug#3540)
- `getProcedures()` does not return any procedures in result set. (Bug#3539)
- Fixed `DatabaseMetaData.getProcedures()` when run on MySQL-5.0.0 (output of `SHOW PROCEDURE STATUS` changed between 5.0.0 and 5.0.1). (Bug#3520)
- Added `connectionCollation` property to cause driver to issue `set collation_connection=...` query on connection init if default collation for given charset is not appropriate. (Bug#3520)
- `DBMD.getSQLStateType()` returns incorrect value. (Bug#3520)
- Correctly map output parameters to position given in `prepareCall()` versus. order implied during `registerOutParameter()`. (Bug#3146)
- Cleaned up detection of server properties. (Bug#3146)

- Correctly detect initial character set for servers \geq 4.1.0. (Bug#3146)
- Support placeholder for parameter metadata for server \geq 4.1.2. (Bug#3146)
- Added `gatherPerformanceMetrics` property, along with properties to control when/where this info gets logged (see docs for more info).
- Fixed case when no parameters could cause a `NullPointerException` in `CallableStatement.setOutputParameters()`.
- Enabled callable statement caching via `cacheCallableStmts` property.
- Fixed sending of split packets for large queries, enabled nio ability to send large packets as well.
- Added `.toString()` functionality to `ServerPreparedStatement`, which should help if you're trying to debug a query that is a prepared statement (it shows SQL as the server would process).
- Added `logSlowQueries` property, along with `slowQueriesThresholdMillis` property to control when a query should be considered "slow."
- Removed wrapping of exceptions in `MysqlIO.changeUser()`.
- Fixed stored procedure parameter parsing info when size was specified for a parameter (for example, `char()`, `varchar()`).
- `ServerPreparedStatements` weren't actually de-allocating server-side resources when `.close()` was called.
- Fixed case when no output parameters specified for a stored procedure caused a bogus query to be issued to retrieve out parameters, leading to a syntax error from the server.

E.6.3.15. Changes in MySQL Connector/J 3.1.1 (14 February 2004)

Bugs fixed:

- Use DocBook version of docs for shipped versions of drivers. (Bug#2671)
- `NULL` fields were not being encoded correctly in all cases in server-side prepared statements. (Bug#2671)
- Fixed rare buffer underflow when writing numbers into buffers for sending prepared statement execution requests. (Bug#2671)
- Fixed `ConnectionProperties` that weren't properly exposed via accessors, cleaned up `ConnectionProperties` code. (Bug#2623)
- Class-cast exception when using scrolling result sets and server-side prepared statements. (Bug#2623)
- Merged unbuffered input code from 3.0. (Bug#2623)
- Enabled streaming of result sets from server-side prepared statements. (Bug#2606)
- Server-side prepared statements were not returning datatype `YEAR` correctly. (Bug#2606)
- Fixed charset conversion issue in `getTables()`. (Bug#2502)
- Implemented multiple result sets returned from a statement or stored procedure. (Bug#2502)
- Implemented `Connection.prepareCall()`, and `DatabaseMetaData.getProcedures()` and `getProcedureColumns()`. (Bug#2359)
- Merged prepared statement caching, and `.getMetaData()` support from 3.0 branch. (Bug#2359)
- Fixed off-by-1900 error in some cases for years in `TimeUtil.fastDate/TimeCreate()` when unpacking results from server-side prepared statements. (Bug#2359)
- Reset `long binary` parameters in `ServerPreparedStatement` when `clearParameters()` is called, by sending `COM_RESET_STMT` to the server. (Bug#2359)
- `NULL` values for numeric types in binary encoded result sets causing `NullPointerExceptions`. (Bug#2359)
- Display where/why a connection was implicitly closed (to aid debugging). (Bug#1673)
- `DatabaseMetaData.getColumns()` is not returning correct column ordinal info for non-'%' column name patterns.

[Bug#1673](#))

- Fixed `NullPointerException` in `ServerPreparedStatement.setTimestamp()`, as well as year and month discrepancies in `ServerPreparedStatement.setTimestamp()`, `setDate()`. ([Bug#1673](#))
- Added ability to have multiple database/JVM targets for compliance and regression/unit tests in `build.xml`. ([Bug#1673](#))
- Fixed sending of queries larger than 16M. ([Bug#1673](#))
- Merged fix of datatype mapping from MySQL type `FLOAT` to `java.sql.Types.REAL` from 3.0 branch. ([Bug#1673](#))
- Fixed NPE and year/month bad conversions when accessing some datetime functionality in `ServerPreparedStatements` and their resultant result sets. ([Bug#1673](#))
- Added named and indexed input/output parameter support to `CallableStatement`. MySQL-5.0.x or newer. ([Bug#1673](#))
- `CommunicationsException` implemented, that tries to determine why communications was lost with a server, and displays possible reasons when `.getMessage()` is called. ([Bug#1673](#))
- Detect collation of column for `RSMD.isCaseSensitive()`. ([Bug#1673](#))
- Optimized `Buffer.readLenByteArray()` to return shared empty byte array when length is 0.
- Fix support for table aliases when checking for all primary keys in `UpdatableResultSet`.
- Unpack “unknown” data types from server prepared statements as `Strings`.
- Implemented `Statement.getWarnings()` for MySQL-4.1 and newer (using `SHOW WARNINGS`).
- Ensure that warnings are cleared before executing queries on prepared statements, as-per JDBC spec (now that we support warnings).
- Correctly initialize datasource properties from JNDI Refs, including explicitly specified URLs.
- Implemented long data (Blobs, Clobs, InputStreams, Readers) for server prepared statements.
- Deal with 0-length tokens in `EscapeProcessor` (caused by callable statement escape syntax).
- `DatabaseMetaData` now reports `supportsStoredProcedures()` for MySQL versions $\geq 5.0.0$
- Support for `mysql_change_user()`. See the `changeUser()` method in `com.mysql.jdbc.Connection`.
- Removed `useFastDates` connection property.
- Support for NIO. Use `useNIO=true` on platforms that support NIO.
- Check for closed connection on delete/update/insert row operations in `UpdatableResultSet`.
- Support for transaction savepoints (MySQL $\geq 4.0.14$ or 4.1.1).
- Support “old” `profileSql` capitalization in `ConnectionProperties`. This property is deprecated, you should use `profileSQL` if possible.
- Fixed character encoding issues when converting bytes to ASCII when MySQL doesn't provide the character set, and the JVM is set to a multi-byte encoding (usually affecting retrieval of numeric values).
- Centralized setting of result set type and concurrency.
- Fixed bug with `UpdatableResultSets` not using client-side prepared statements.
- Default result set type changed to `TYPE_FORWARD_ONLY` (JDBC compliance).
- Fixed `IllegalAccessError` to `Calendar.getTimeInMillis()` in `DateTimeValue` (for JDK < 1.4).
- Allow contents of `PreparedStatement.setBlob()` to be retained between calls to `.execute*()`.
- Fixed stack overflow in `Connection.prepareCall()` (bad merge).
- Refactored how connection properties are set and exposed as `DriverPropertyInfo` as well as `Connection` and `DataSource` properties.
- Reduced number of methods called in average query to be more efficient.

- Prepared `Statements` will be re-prepared on auto-reconnect. Any errors encountered are postponed until first attempt to re-execute the re-prepared statement.

E.6.3.16. Changes in MySQL Connector/J 3.1.0 (18 February 2003)

Bugs fixed:

- Added `useServerPrepStmts` property (default `false`). The driver will use server-side prepared statements when the server version supports them (4.1 and newer) when this property is set to `true`. It is currently set to `false` by default until all bind/fetch functionality has been implemented. Currently only DML prepared statements are implemented for 4.1 server-side prepared statements.
- Added `requireSSL` property.
- Track open `Statements`, close all when `Connection.close()` is called (JDBC compliance).

E.6.4. Changes in MySQL Connector/J 3.0.x

E.6.4.1. Changes in MySQL Connector/J 3.0.17 (23 June 2005)

Bugs fixed:

- Workaround for server [Bug#9098](#): Default values of `CURRENT_*` for `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` columns can't be distinguished from `string` values, so `UpdatableResultSet.moveToInsertRow()` generates bad SQL for inserting default values. ([Bug#8812](#))
- `NON_UNIQUE` column from `DBMD.getIndexInfo()` returned inverted value. ([Bug#8812](#))
- `EUCKR` charset is sent as `SET NAMES euc_kr` which MySQL-4.1 and newer doesn't understand. ([Bug#8629](#))
- Added support for the `EUC_JP_Solaris` character encoding, which maps to a MySQL encoding of `euc_jpms` (backported from 3.1 branch). This only works on servers that support `euc_jpms`, namely 5.0.3 or later. ([Bug#8629](#))
- Use hex escapes for `PreparedStatement.setBytes()` for double-byte charsets including "aliases" `Windows-31J`, `CP934`, `MS932`. ([Bug#8629](#))
- `DatabaseMetaData.supportsSelectForUpdate()` returns correct value based on server version. ([Bug#8629](#))
- Which requires hex escaping of binary data when using multi-byte charsets with prepared statements. ([Bug#8064](#))
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug #[Bug#7952](#))
- Backported `SQLState` codes mapping from Connector/J 3.1, enable with `useSqlStateCodes=true` as a connection property, it defaults to `false` in this release, so that we don't break legacy applications (it defaults to `true` starting with Connector/J 3.1). ([Bug#7686](#))
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug #[Bug#7686](#))
- `MS932`, `SHIFT_JIS`, and `Windows_31J` not recognized as aliases for `sjis`. ([Bug#7607](#))
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. ([Bug#7601](#))
- Handle streaming result sets with more than 2 billion rows properly by fixing wraparound of row number counter. ([Bug#7601](#))
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug #[Bug#7601](#))
- Escape sequence `{fn convert(..., type)}` now supports ODBC-style types that are prepended by `SQL_`. ([Bug#7601](#))
- Statements created from a pooled connection were returning physical connection instead of logical connection when `getConnection()` was called. ([Bug#7316](#))
- Support new protocol type `MYSQL_TYPE_VARCHAR`. ([Bug#7081](#))

- Added `useOldUTF8Behavior` configuration property, which causes JDBC driver to act like it did with MySQL-4.0.x and earlier when the character encoding is `utf-8` when connected to MySQL-4.1 or newer. (Bug#7081)
- `DatabaseMetaData.getIndexInfo()` ignored `unique` parameter. (Bug#7081)
- `PreparedStatement` don't encode Big5 (and other multi-byte) character sets correctly in static SQL strings. (Bug#7033)
- Connections starting up failed-over (due to down master) never retry master. (Bug#6966)
- Adding CP943 to aliases for `sjis`. (Bug#6549, Bug#7607)
- `Timestamp/Time` conversion goes in the wrong “direction” when `useTimeZone=true` and server time zone differs from client time zone. (Bug#5874)

E.6.4.2. Changes in MySQL Connector/J 3.0.16 (15 November 2004)

Bugs fixed:

- Made `TINYINT(1)` -> `BIT/Boolean` conversion configurable via `tinyIntIsBit` property (default `true` to be JDBC compliant out of the box). (Bug#5664)
- Off-by-one bug in `Buffer.readString(string)`. (Bug#5664)
- `ResultSet.updateByte()` when on insert row throws `ArrayOutOfBoundsException`. (Bug#5664)
- Fixed regression where `useUnbufferedInput` was defaulting to `false`. (Bug#5664)
- `ResultSet.getTimestamp()` on a column with `TIME` in it fails. (Bug#5664)
- Fixed `DatabaseMetaData.getTypes()` returning incorrect (this is, non-negative) scale for the `NUMERIC` type. (Bug#5664)
- Only set `character_set_results` during connection establishment if server version \geq 4.1.1. (Bug#5664)
- Fixed `ResultSetMetaData.isReadOnly()` to detect non-writable columns when connected to MySQL-4.1 or newer, based on existence of “original” table and column names.
- Re-issue character set configuration commands when re-using pooled connections and/or `Connection.changeUser()` when connected to MySQL-4.1 or newer.

E.6.4.3. Changes in MySQL Connector/J 3.0.15 (04 September 2004)

Bugs fixed:

- `ResultSet.getMetaData()` should not return incorrectly initialized metadata if the result set has been closed, but should instead throw an `SQLException`. Also fixed for `getRow()` and `getWarnings()` and traversal methods by calling `checkClosed()` before operating on instance-level fields that are nullified during `.close()`. (Bug#5069)
- Use `_binary` introducer for `PreparedStatement.setBytes()` and `set*Stream()` when connected to MySQL-4.1.x or newer to avoid misinterpretation during character conversion. (Bug#5069)
- Parse new time zone variables from 4.1.x servers. (Bug#5069)
- `ResultSet` should release `Field[]` instance in `.close()`. (Bug#5022)
- `RSMD.getPrecision()` returning 0 for non-numeric types (should return max length in chars for non-binary types, max length in bytes for binary types). This fix also fixes mapping of `RSMD.getColumnType()` and `RSMD.getColumnTypeName()` for the `BLOB` types based on the length sent from the server (the server doesn't distinguish between `TINYBLOB`, `BLOB`, `MEDIUMBLOB` or `LONGBLOB` at the network protocol level). (Bug#4880)
- “Production” is now “GA” (General Availability) in naming scheme of distributions. (Bug#4860, Bug#4138)
- `DBMD.getColumns()` returns incorrect JDBC type for unsigned columns. This affects type mappings for all numeric types in the `RSMD.getColumnType()` and `RSMD.getColumnTypeNames()` methods as well, to ensure that “like” types from `DBMD.getColumns()` match up with what `RSMD.getColumnType()` and `getColumnTypeNames()` return. (Bug#4860, Bug#4138)

- Calling `.close()` twice on a `PooledConnection` causes NPE. (Bug#4808)
- `DOUBLE` mapped twice in `DBMD.getTypeInfo()`. (Bug#4742)
- Added FLOSS license exemption. (Bug#4742)
- Removed redundant calls to `checkRowPos()` in `ResultSet`. (Bug#4334)
- Failover for `autoReconnect` not using port numbers for any hosts, and not retrying all hosts.

Warning

This required a change to the `SocketFactory connect()` method signature, which is now `public Socket connect(String host, int portNumber, Properties props)`; therefore, any third-party socket factories will have to be changed to support this signature.

(Bug#4334)

- Logical connections created by `MysqlConnectionPoolDataSource` will now issue a `rollback()` when they are closed and sent back to the pool. If your application server/connection pool already does this for you, you can set the `rollbackOnPooledClose` property to `false` to avoid the overhead of an extra `rollback()`. (Bug#4334)
- `StringUtil.escapeEasternUnicodeByteStream` was still broken for GBK. (Bug#4010)

E.6.4.4. Changes in MySQL Connector/J 3.0.14 (28 May 2004)

Bugs fixed:

- Fixed URL parsing error.

E.6.4.5. Changes in MySQL Connector/J 3.0.13 (27 May 2004)

Bugs fixed:

- `No Database Selected` when using `MysqlConnectionPoolDataSource`. (Bug#3920)
- `PreparedStatement.getGeneratedKeys()` method returns only 1 result for batched insertions. (Bug#3873)
- Using a `MySQLDataSource` without server name fails. (Bug#3848)

E.6.4.6. Changes in MySQL Connector/J 3.0.12 (18 May 2004)

Bugs fixed:

- Inconsistent reporting of data type. The server still doesn't return all types for `*BLOBs` `*TEXT` correctly, so the driver won't return those correctly. (Bug#3570)
- `UpdatableResultSet` not picking up default values for `moveToInsertRow()`. (Bug#3557)
- Not specifying database in URL caused `MalformedURLException` exception. (Bug#3554)
- Auto-convert MySQL encoding names to Java encoding names if used for `characterEncoding` property. (Bug#3554)
- Use `junit.textui.TestRunner` for all unit tests (to allow them to be run from the command line outside of Ant or Eclipse). (Bug#3554)
- Added encoding names that are recognized on some JVMs to fix case where they were reverse-mapped to MySQL encoding names incorrectly. (Bug#3554)
- Made `StringRegressionTest` 4.1-unicode aware. (Bug#3520)
- Fixed regression in `PreparedStatement.setString()` and eastern character encodings. (Bug#3520)
- `DBMD.getSQLStateType()` returns incorrect value. (Bug #Bug#3520)

- Renamed `StringUtils.escapeSJISByteStream()` to more appropriate `escapeEasternUnicodeByteStream()`. (Bug#3511)
- `StringUtils.escapeSJISByteStream()` not covering all eastern double-byte charsets correctly. (Bug#3511)
- Return creating statement for `ResultSets` created by `getGeneratedKeys()`. (Bug#2957)
- Use `SET character_set_results` during initialization to allow any charset to be returned to the driver for result sets. (Bug#2670)
- Don't truncate `BLOB` or `CLOB` values when using `setBytes()` and/or `setBinary/CharacterStream()`. (Bug#2670)
- Dynamically configure character set mappings for field-level character sets on MySQL-4.1.0 and newer using `SHOW COLLATION` when connecting. (Bug#2670)
- Map `binary` character set to `US-ASCII` to support `DATETIME` charset recognition for servers $\geq 4.1.2$. (Bug#2670)
- Use `charsetnr` returned during connect to encode queries before issuing `SET NAMES` on MySQL $\geq 4.1.0$. (Bug#2670)
- Add helper methods to `ResultSetMetaData` (`getColumnCharacterEncoding()` and `getColumnCharacterSet()`) to allow end-users to see what charset the driver thinks it should be using for the column. (Bug#2670)
- Only set `character_set_results` for MySQL $\geq 4.1.0$. (Bug#2670)
- Allow `url` parameter for `MysqlDataSource` and `MysqlConnectionPool DataSource` so that passing of other properties is possible from inside appservers.
- Don't escape SJIS/GBK/BIG5 when using MySQL-4.1 or newer.
- Backport documentation tooling from 3.1 branch.
- Added `failOverReadOnly` property, to allow end-user to configure state of connection (read-only/writable) when failed over.
- Allow `java.util.Date` to be sent in as parameter to `PreparedStatement.setObject()`, converting it to a `Timestamp` to maintain full precision. (Bug#103)
- Add unsigned attribute to `DatabaseMetaData.getColumns()` output in the `TYPE_NAME` column.
- Map duplicate key and foreign key errors to `SQLState` of `23000`.
- Backported “change user” and “reset server state” functionality from 3.1 branch, to allow clients of `MysqlConnectionPoolDataSource` to reset server state on `getConnection()` on a pooled connection.

E.6.4.7. Changes in MySQL Connector/J 3.0.11 (19 February 2004)

Bugs fixed:

- Return `java.lang.Double` for `FLOAT` type from `ResultSetMetaData.getColumnClassName()`. (Bug#2855)
- Return `[B` instead of `java.lang.Object` for `BINARY`, `VARBINARY` and `LONGVARBINARY` types from `ResultSetMetaData.getColumnClassName()` (JDBC compliance). (Bug#2855)
- Issue connection events on all instances created from a `ConnectionPoolDataSource`. (Bug#2855)
- Return `java.lang.Integer` for `TINYINT` and `SMALLINT` types from `ResultSetMetaData.getColumnClassName()`. (Bug#2852)
- Added `useUnbufferedInput` parameter, and now use it by default (due to JVM issue <http://developer.java.sun.com/developer/bugParade/bugs/4401235.html>) (Bug#2578)
- Fixed failover always going to last host in list. (Bug#2578)
- Detect `on/off` or `1, 2, 3` form of `lower_case_table_names` value on server. (Bug#2578)
- `AutoReconnect` time was growing faster than exponentially. (Bug#2447)
- Trigger a `SET NAMES utf8` when encoding is forced to `utf8` or `utf-8` via the `characterEncoding` property. Previously, only the Java-style encoding name of `utf-8` would trigger this.

E.6.4.8. Changes in MySQL Connector/J 3.0.10 (13 January 2004)

Bugs fixed:

- Enable caching of the parsing stage of prepared statements via the `cachePrepStmts`, `prepStmtCacheSize`, and `prepStmtCacheSqlLimit` properties (disabled by default). (Bug#2006)
- Fixed security exception when used in Applets (applets can't read the system property `file.encoding` which is needed for `LOAD DATA LOCAL INFILE`). (Bug#2006)
- Speed up parsing of `PreparedStatement`s, try to use one-pass whenever possible. (Bug#2006)
- Fixed exception `Unknown character set 'danish'` on connect with JDK-1.4.0 (Bug#2006)
- Fixed mappings in `SQLException` to report deadlocks with `SQLStates` of `41000`. (Bug#2006)
- Removed static synchronization bottleneck from instance factory method of `SingleByteCharsetConverter`. (Bug#2006)
- Removed static synchronization bottleneck from `PreparedStatement.setTimestamp()`. (Bug#2006)
- `ResultSet.findColumn()` should use first matching column name when there are duplicate column names in `SELECT` query (JDBC-compliance). (Bug#2006)
- `maxRows` property would affect internal statements, so check it for all statement creation internal to the driver, and set to 0 when it is not. (Bug#2006)
- Use constants for `SQLStates`. (Bug#2006)
- Map charset `ko18_ru` to `ko18r` when connected to MySQL-4.1.0 or newer. (Bug#2006)
- Ensure that `Buffer.writeString()` saves room for the `\0`. (Bug#2006)
- `ArrayIndexOutOfBoundsException` when parameter number == number of parameters + 1. (Bug#1958)
- Connection property `maxRows` not honored. (Bug#1933)
- Statements being created too many times in `DBMD.extractForeignKeyFromCreateTable()`. (Bug#1925)
- Support escape sequence `{fn convert ... }`. (Bug#1914)
- Implement `ResultSet.updateClob()`. (Bug#1913)
- Autoreconnect code didn't set catalog upon reconnect if it had been changed. (Bug#1913)
- `ResultSet.getObject()` on `TINYINT` and `SMALLINT` columns should return Java type `Integer`. (Bug#1913)
- Added more descriptive error message `Server Configuration Denies Access to DataSource`, as well as retrieval of message from server. (Bug#1913)
- `ResultSetMetaData.isCaseSensitive()` returned wrong value for `CHAR/VARCHAR` columns. (Bug#1913)
- Added `alwaysClearStream` connection property, which causes the driver to always empty any remaining data on the input stream before each query. (Bug#1913)
- `DatabaseMetaData.getSystemFunction()` returning bad function `VResultsSion`. (Bug#1775)
- Foreign Keys column sequence is not consistent in `DatabaseMetaData.getImported/Exported/CrossReference()`. (Bug#1731)
- Fix for `ArrayIndexOutOfBoundsException` exception when using `Statement.setMaxRows()`. (Bug#1695)
- Subsequent call to `ResultSet.updateFoo()` causes NPE if result set is not updatable. (Bug#1630)
- Fix for 4.1.1-style authentication with no password. (Bug#1630)
- Cross-database updatable result sets are not checked for updatability correctly. (Bug#1592)
- `DatabaseMetaData.getColumns()` should return `Types.LONGVARCHAR` for MySQL `LONGTEXT` type. (Bug#1592)
- Fixed regression of `Statement.getGeneratedKeys()` and `REPLACE` statements. (Bug#1576)

- Barge blobs and split packets not being read correctly. ([Bug#1576](#))
- Backported fix for aliased tables and `UpdatableResultSets` in `checkUpdatability()` method from 3.1 branch. ([Bug#1534](#))
- “Friendlier” exception message for `PacketTooLargeException`. ([Bug#1534](#))
- Don't count quoted IDs when inside a 'string' in `PreparedStatement` parsing. ([Bug#1511](#))

E.6.4.9. Changes in MySQL Connector/J 3.0.9 (07 October 2003)

Bugs fixed:

- `ResultSet.getString/setString` mashing char 127. ([Bug#1247](#))
- Added property to “clobber” streaming results, by setting the `clobberStreamingResults` property to `true` (the default is `false`). This will cause a “streaming” `ResultSet` to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server. ([Bug#1247](#))
- Added `com.mysql.jdbc.util.BaseBugReport` to help creation of testcases for bug reports. ([Bug#1247](#))
- Backported authentication changes for 4.1.1 and newer from 3.1 branch. ([Bug#1247](#))
- Made `databaseName`, `portNumber`, and `serverName` optional parameters for `MysqlDataSourceFactory`. ([Bug#1246](#))
- Optimized `CLOB.setCharacterStream()`. ([Bug#1131](#))
- Fixed `CLOB.truncate()`. ([Bug#1130](#))
- Fixed deadlock issue with `Statement.setMaxRows()`. ([Bug#1099](#))
- `DatabaseMetaData.getColumns()` getting confused about the keyword “set” in character columns. ([Bug#1099](#))
- Clip +/- INF (to smallest and largest representative values for the type in MySQL) and NaN (to 0) for `setDouble/setFloat()`, and issue a warning on the statement when the server does not support +/- INF or NaN. ([Bug#884](#))
- Don't fire connection closed events when closing pooled connections, or on `PooledConnection.getConnection()` with already open connections. ([Bug#884](#))
- Double-escaping of `'\'` when charset is SJIS or GBK and `'\'` appears in non-escaped input. ([Bug#879](#))
- When emptying input stream of unused rows for “streaming” result sets, have the current thread `yield()` every 100 rows in order to not monopolize CPU time. ([Bug#879](#))
- Issue exception on `ResultSet.getXXX()` on empty result set (wasn't caught in some cases). ([Bug#848](#))
- Don't hide messages from exceptions thrown in I/O layers. ([Bug#848](#))
- Fixed regression in large split-packet handling. ([Bug#848](#))
- Better diagnostic error messages in exceptions for “streaming” result sets. ([Bug#848](#))
- Don't change timestamp TZ twice if `useTimeZone==true`. ([Bug#774](#))
- Don't wrap `SQLExceptions` in `RowDataDynamic`. ([Bug#688](#))
- Don't try and reset isolation level on reconnect if MySQL doesn't support them. ([Bug#688](#))
- The `insertRow` in an `UpdatableResultSet` is now loaded with the default column values when `moveToInsertRow()` is called. ([Bug#688](#))
- `DatabaseMetaData.getColumns()` wasn't returning `NULL` for default values that are specified as `NULL`. ([Bug#688](#))
- Change default statement type/concurrency to `TYPE_FORWARD_ONLY` and `CONCUR_READ_ONLY` (spec compliance). ([Bug#688](#))
- Fix `UpdatableResultSet` to return values for `getXXX()` when on insert row. ([Bug#675](#))
- Support `InnoDB` constraint names when extracting foreign key information in `DatabaseMetaData` (implementing ideas

from Parwinder Sekhon). ([Bug#664](#), [Bug#517](#))

- Backported 4.1 protocol changes from 3.1 branch (server-side SQL states, new field information, larger client capability flags, connect-with-database, and so forth). ([Bug#664](#), [Bug#517](#))
- `refreshRow` didn't work when primary key values contained values that needed to be escaped (they ended up being doubly escaped). ([Bug#661](#))
- Fixed `ResultSet.previous()` behavior to move current position to before result set when on first row of result set. ([Bug#496](#))
- Fixed `Statement` and `PreparedStatement` issuing bogus queries when `setMaxRows()` had been used and a `LIMIT` clause was present in the query. ([Bug#496](#))
- Faster date handling code in `ResultSet` and `PreparedStatement` (no longer uses `Date` methods that synchronize on static calendars).
- Fixed test for end of buffer in `Buffer.readString()`.

E.6.4.10. Changes in MySQL Connector/J 3.0.8 (23 May 2003)

Bugs fixed:

- Fixed SJIS encoding bug, thanks to Naoto Sato. ([Bug#378](#))
- Fix problem detecting server character set in some cases. ([Bug#378](#))
- Allow multiple calls to `Statement.close()`. ([Bug#378](#))
- Return correct number of generated keys when using `REPLACE` statements. ([Bug#378](#))
- Unicode character 0xFFFF in a string would cause the driver to throw an `ArrayOutOfBoundsException`. ([Bug#378](#))
- Fix row data decoding error when using *very* large packets. ([Bug#378](#))
- Optimized row data decoding. ([Bug#378](#))
- Issue exception when operating on an already closed prepared statement. ([Bug#378](#))
- Optimized usage of `EscapeProcessor`. ([Bug#378](#))
- Use JVM charset with filenames and `LOAD DATA [LOCAL] INFILE`.
- Fix infinite loop with `Connection.cleanup()`.
- Changed Ant target `compile-core` to `compile-driver`, and made testsuite compilation a separate target.
- Fixed result set not getting set for `Statement.executeUpdate()`, which affected `getGeneratedKeys()` and `getUpdateCount()` in some cases.
- Return list of generated keys when using multi-value `INSERTS` with `Statement.getGeneratedKeys()`.
- Allow bogus URLs in `Driver.getPropertyInfo()`.

E.6.4.11. Changes in MySQL Connector/J 3.0.7 (08 April 2003)

Bugs fixed:

- Fixed charset issues with database metadata (charset was not getting set correctly).
- You can now toggle profiling on/off using `Connection.setProfileSql(boolean)`.
- 4.1 Column Metadata fixes.
- Fixed `MysqlPooledConnection.close()` calling wrong event type.
- Fixed `StringIndexOutOfBoundsException` in `PreparedStatement.setClob()`.

- `IOExceptions` during a transaction now cause the `Connection` to be closed.
- Remove synchronization from `Driver.connect()` and `Driver.acceptsUrl()`.
- Fixed missing conversion for `YEAR` type in `ResultSetMetaData.getColumnTypeName()`.
- Updatable `ResultSets` can now be created for aliased tables/columns when connected to MySQL-4.1 or newer.
- Fixed `LOAD DATA LOCAL INFILE` bug when file > `max_allowed_packet`.
- Don't pick up indexes that start with `pri` as primary keys for `DBMD.getPrimaryKeys()`.
- Ensure that packet size from `alignPacketSize()` does not exceed `max_allowed_packet` (JVM bug)
- Don't reset `Connection.isReadOnly()` when autoReconnecting.
- Fixed escaping of `0x5c ('\\')` character for GBK and Big5 charsets.
- Fixed `ResultSet.getTimestamp()` when underlying field is of type `DATE`.
- Throw `SQLExceptions` when trying to do operations on a forcefully closed `Connection` (that is, when a communication link failure occurs).

E.6.4.12. Changes in MySQL Connector/J 3.0.6 (18 February 2003)

Bugs fixed:

- Backported 4.1 charset field info changes from Connector/J 3.1.
- Fixed `Statement.setMaxRows()` to stop sending `LIMIT` type queries when not needed (performance).
- Fixed `DBMD.getTypeInfo()` and `DBMD.getColumns()` returning different value for precision in `TEXT` and `BLOB` types.
- Fixed `SQLExceptions` getting swallowed on initial connect.
- Fixed `ResultSetMetaData` to return "" when catalog not known. Fixes `NullPointerExceptions` with Sun's `CachedRowSet`.
- Allow ignoring of warning for “non transactional tables” during rollback (compliance/usability) by setting `ignoreNonTxTables` property to `true`.
- Clean up `Statement` query/method mismatch tests (that is, `INSERT` not allowed with `.executeQuery()`).
- Fixed `ResultSetMetaData.isWritable()` to return correct value.
- More checks added in `ResultSet` traversal method to catch when in closed state.
- Implemented `Blob.setBytes()`. You still need to pass the resultant `Blob` back into an updatable `ResultSet` or `PreparedStatement` to persist the changes, because MySQL does not support “locators”.
- Add “window” of different `NULL` sorting behavior to `DBMD.nullsAreSortedAtStart` (4.0.2 to 4.0.10, true; otherwise, no).

E.6.4.13. Changes in MySQL Connector/J 3.0.5 (22 January 2003)

Bugs fixed:

- Fixed `ResultSet.isBeforeFirst()` for empty result sets.
- Added missing `LONGTEXT` type to `DBMD.getColumns()`.
- Implemented an empty `TypeMap` for `Connection.getTypeMap()` so that some third-party apps work with MySQL (IBM WebSphere 5.0 Connection pool).
- Added update options for foreign key metadata.

- Fixed `Buffer.fastSkipLenString()` causing `ArrayIndexOutOfBoundsException` exceptions with some queries when unpacking fields.
- Quote table names in `DatabaseMetaData.getColumns()`, `getPrimaryKeys()`, `getIndexInfo()`, `getBestRowIdentifier()`.
- Retrieve `TX_ISOLATION` from database for `Connection.getTransactionIsolation()` when the MySQL version supports it, instead of an instance variable.
- Greatly reduce memory required for `setBinaryStream()` in `PreparedStatement`s.

E.6.4.14. Changes in MySQL Connector/J 3.0.4 (06 January 2003)

Bugs fixed:

- Streamlined character conversion and `byte[]` handling in `PreparedStatement`s for `setByte()`.
- Fixed `PreparedStatement.executeBatch()` parameter overwriting.
- Added quoted identifiers to database names for `Connection.setCatalog`.
- Added support for 4.0.8-style large packets.
- Reduce memory footprint of `PreparedStatement`s by sharing outbound packet with `MySQLIO`.
- Added `strictUpdates` property to allow control of amount of checking for “correctness” of updatable result sets. Set this to `false` if you want faster updatable result sets and you know that you create them from `SELECT` statements on tables with primary keys and that you have selected all primary keys in your query.
- Added support for quoted identifiers in `PreparedStatement` parser.

E.6.4.15. Changes in MySQL Connector/J 3.0.3 (17 December 2002)

Bugs fixed:

- Allow user to alter behavior of `Statement/PreparedStatement.executeBatch()` via `continueBatchOnError` property (defaults to `true`).
- More robust escape tokenizer: Recognize `--` comments, and allow nested escape sequences (see `test-suite.EscapeProcessingTest`).
- Fixed `Buffer.isLastDataPacket()` for 4.1 and newer servers.
- `NamedPipeSocketFactory` now works (only intended for Windows), see `README` for instructions.
- Changed `charsToByte` in `SingleByteCharConverter` to be non-static.
- Use non-aliased table/column names and database names to fully qualify tables and columns in `UpdatableResultSet` (requires MySQL-4.1 or newer).
- `LOAD DATA LOCAL INFILE ...` now works, if your server is configured to allow it. Can be turned off with the `allowLoadLocalInfile` property (see the `README`).
- Implemented `Connection.nativeSQL()`.
- Fixed `ResultSetMetaData.getColumnTypeName()` returning `BLOB` for `TEXT` and `TEXT` for `BLOB` types.
- Fixed charset handling in `Fields.java`.
- Because of above, implemented `ResultSetMetaData.isAutoIncrement()` to use `Field.isAutoIncrement()`.
- Substitute `'?'` for unknown character conversions in single-byte character sets instead of `'\0'`.
- Added `CLIENT_LONG_FLAG` to be able to get more column flags (`isAutoIncrement()` being the most important).
- Honor `lower_case_table_names` when enabled in the server when doing table name comparisons in `DatabaseMetaData` methods.

- `DBMD.getImported/ExportedKeys()` now handles multiple foreign keys per table.
- More robust implementation of updatable result sets. Checks that *all* primary keys of the table have been selected.
- Some MySQL-4.1 protocol support (extended field info from selects).
- Check for connection closed in more `Connection` methods (`createStatement`, `prepareStatement`, `setTransactionIsolation`, `setAutoCommit`).
- Fixed `ResultSetMetaData.getPrecision()` returning incorrect values for some floating-point types.
- Changed `SingleByteCharConverter` to use lazy initialization of each converter.

E.6.4.16. Changes in MySQL Connector/J 3.0.2 (08 November 2002)

Bugs fixed:

- Implemented `Clob.setString()`.
- Added `com.mysql.jdbc.MiniAdmin` class, which allows you to send `shutdown` command to MySQL server. This is intended to be used when “embedding” Java and MySQL server together in an end-user application.
- Added SSL support. See `README` for information on how to use it.
- All `DBMD` result set columns describing schemas now return `NULL` to be more compliant with the behavior of other JDBC drivers for other database systems (MySQL does not support schemas).
- Use `SHOW CREATE TABLE` when possible for determining foreign key information for `DatabaseMetaData`. Also allows cascade options for `DELETE` information to be returned.
- Implemented `Clob.setCharacterStream()`.
- Failover and `autoReconnect` work only when the connection is in an `autoCommit(false)` state, in order to stay transaction-safe.
- Fixed `DBMD.supportsResultSetConcurrency()` so that it returns `true` for `ResultSet.TYPE_SCROLL_INSENSITIVE` and `ResultSet.CONCUR_READ_ONLY` or `ResultSet.CONCUR_UPDATABLE`.
- Implemented `Clob.setAsciiStream()`.
- Removed duplicate code from `UpdatableResultSet` (it can be inherited from `ResultSet`, the extra code for each method to handle updatability I thought might someday be necessary has not been needed).
- Fixed `UnsupportedEncodingException` thrown when “forcing” a character encoding via properties.
- Fixed incorrect conversion in `ResultSet.getLong()`.
- Implemented `ResultSet.updateBlob()`.
- Removed some not-needed temporary object creation by smarter use of `Strings` in `EscapeProcessor`, `Connection` and `DatabaseMetaData` classes.
- Escape `0x5c` character in strings for the SJIS charset.
- `PreparedStatement` now honors stream lengths in `setBinary/Ascii/CharacterStream()` unless you set the connection property `useStreamLengthsInPrepStmts` to `false`.
- Fixed issue with updatable result sets and `PreparedStatements` not working.
- Fixed start position off-by-1 error in `Clob.getSubString()`.
- Added `connectTimeout` parameter that allows users of JDK-1.4 and newer to specify a maximum time to wait to establish a connection.
- Fixed various non-ASCII character encoding issues.
- Fixed `ResultSet.isLast()` for empty result sets (should return `false`).
- Added driver property `useHostsInPrivileges`. Defaults to `true`. Affects whether or not `@hostname` will be used in

`DBMD.getColumn/TablePrivileges`.

- Fixed `ResultSet.setFetchDirection(FETCH_UNKNOWN)`.
- Added `queriesBeforeRetryMaster` property that specifies how many queries to issue when failed over before attempting to reconnect to the master (defaults to 50).
- Fixed issue when calling `Statement.setFetchSize()` when using arbitrary values.
- Properly restore connection properties when autoReconnecting or failing-over, including `autoCommit` state, and isolation level.
- Implemented `Clob.truncate()`.

E.6.4.17. Changes in MySQL Connector/J 3.0.1 (21 September 2002)

Bugs fixed:

- Charsets now automatically detected. Optimized code for single-byte character set conversion.
- Fixed `ResultSetMetaData.isSigned()` for `TINYINT` and `BIGINT`.
- Fixed `RowDataStatic.getAt()` off-by-one bug.
- Fixed `ResultSet.getRow()` off-by-one bug.
- Massive code clean-up to follow Java coding conventions (the time had come).
- Implemented `ResultSet.getCharacterStream()`.
- Added limited `Clob` functionality (`ResultSet.getClob()`, `PreparedStatement.setClob()`, `PreparedStatement.setObject(Clob)`).
- `Connection.isClosed()` no longer “pings” the server.
- `Connection.close()` issues `rollback()` when `getAutoCommit()` is `false`.
- Added `socketTimeout` parameter to URL.
- Added `LOCAL TEMPORARY` to table types in `DatabaseMetaData.getTableTypes()`.
- Added `paranoid` parameter, which sanitizes error messages by removing “sensitive” information from them (such as hostnames, ports, or usernames), as well as clearing “sensitive” data structures when possible.

E.6.4.18. Changes in MySQL Connector/J 3.0.0 (31 July 2002)

Bugs fixed:

- General source-code cleanup.
- The driver now only works with JDK-1.2 or newer.
- Fix and sort primary key names in `DBMetaData` (SF bugs 582086 and 582086).
- `ResultSet.getTimestamp()` now works for `DATE` types (SF bug 559134).
- Float types now reported as `java.sql.Types.FLOAT` (SF bug 579573).
- Support for streaming (row-by-row) result sets (see [README](#)) Thanks to Doron.
- Testsuite now uses Junit (which you can get from <http://www.junit.org>).
- JDBC Compliance: Passes all tests besides stored procedure tests.
- `ResultSet.getDate/Time/Timestamp` now recognizes all forms of invalid values that have been set to all zeros by MySQL (SF bug 586058).

- Added multi-host failover support (see [README](#)).
- Repackaging: New driver name is `com.mysql.jdbc.Driver`, old name still works, though (the driver is now provided by MySQL-AB).
- Support for large packets (new addition to MySQL-4.0 protocol), see [README](#) for more information.
- Better checking for closed connections in `Statement` and `PreparedStatement`.
- Performance improvements in string handling and field metadata creation (lazily instantiated) contributed by Alex Twisleton-Wykeham-Fiennes.
- JDBC-3.0 functionality including `Statement/PreparedStatement.getGeneratedKeys()` and `ResultSet.getURL()`.
- Overall speed improvements via controlling transient object creation in `MysqlIO` class when reading packets.
- **!!! LICENSE CHANGE !!!** The driver is now GPL. If you need non-GPL licenses, please contact me [<mark@mysql.com>](mailto:mark@mysql.com).
- Performance enhancements: Driver is now 50–100% faster in most situations, and creates fewer temporary objects.

E.6.5. Changes in MySQL Connector/J 2.0.x

E.6.5.1. Changes in MySQL Connector/J 2.0.14 (16 May 2002)

Bugs fixed:

- `ResultSet.getDouble()` now uses code built into JDK to be more precise (but slower).
- Fixed typo for `relaxAutoCommit` parameter.
- `LogicalHandle.isClosed()` calls through to physical connection.
- Added SQL profiling (to `STDERR`). Set `profileSql=true` in your JDBC URL. See [README](#) for more information.
- `PreparedStatement` now releases resources on `.close()`. (SF bug 553268)
- More code cleanup.
- Quoted identifiers not used if server version does not support them. Also, if server started with `--ansi` or `--sql-mode=ANSI_QUOTES`, “” will be used as an identifier quote character, otherwise “'” will be used.

E.6.5.2. Changes in MySQL Connector/J 2.0.13 (24 April 2002)

Bugs fixed:

- Fixed unicode chars being read incorrectly. (SF bug 541088)
- Faster blob escaping for `PrepStmt`.
- Added `setURL()` to `MySQLXADataSource`. (SF bug 546019)
- Added `set/getPortNumber()` to `DataSource(s)`. (SF bug 548167)
- `PreparedStatement.toString()` fixed. (SF bug 534026)
- More code cleanup.
- Rudimentary version of `Statement.getGeneratedKeys()` from JDBC-3.0 now implemented (you need to be using JDK-1.4 for this to work, I believe).
- `DBMetaData.getIndexInfo()` - bad PAGES fixed. (SF BUG 542201)
- `ResultSetMetaData.getColumnClassName()` now implemented.

E.6.5.3. Changes in MySQL Connector/J 2.0.12 (07 April 2002)

Bugs fixed:

- Fixed `testsuite.Traversal afterLast()` bug, thanks to Igor Lastric.
- Added new types to `getTypeInfo()`, fixed existing types thanks to Al Davis and Kid Kalanon.
- Fixed time zone off-by-1-hour bug in `PreparedStatement` (538286, 528785).
- Added identifier quoting to all `DatabaseMetaData` methods that need them (should fix 518108).
- Added support for `BIT` types (51870) to `PreparedStatement`.
- `ResultSet.insertRow()` should now detect `auto_increment` fields in most cases and use that value in the new row. This detection will not work in multi-valued keys, however, due to the fact that the MySQL protocol does not return this information.
- Relaxed synchronization in all classes, should fix 520615 and 520393.
- `DataSources` - fixed `setUrl` bug (511614, 525565), wrong datasource class name (532816, 528767).
- Added support for `YEAR` type (533556).
- Fixes for `ResultSet` updatability in `PreparedStatement`.
- `ResultSet`: Fixed updatability (values being set to `null` if not updated).
- Added `getTable/ColumnPrivileges()` to `DBMD` (fixes 484502).
- Added `getIdleFor()` method to `Connection` and `MysqlLogicalHandle`.
- `ResultSet.refreshRow()` implemented.
- Fixed `getRow()` bug (527165) in `ResultSet`.
- General code cleanup.

E.6.5.4. Changes in MySQL Connector/J 2.0.11 (27 January 2002)

Bugs fixed:

- Full synchronization of `Statement.java`.
- Fixed missing `DELETE_RULE` value in `DBMD.getImported/ExportedKeys()` and `getCrossReference()`.
- More changes to fix `Unexpected end of input stream` errors when reading `BLOB` values. This should be the last fix.

E.6.5.5. Changes in MySQL Connector/J 2.0.10 (24 January 2002)

Bugs fixed:

- Fixed null-pointer-exceptions when using `MysqlConnectionPoolDataSource` with Websphere 4 (bug 505839).
- Fixed spurious `Unexpected end of input stream` errors in `MysqlIO` (bug 507456).

E.6.5.6. Changes in MySQL Connector/J 2.0.9 (13 January 2002)

Bugs fixed:

- Fixed extra memory allocation in `MysqlIO.readPacket()` (bug 488663).
- Added detection of network connection being closed when reading packets (thanks to Todd Lizambri).

- Fixed casting bug in `PreparedStatement` (bug 488663).
- `DataSource` implementations moved to `org.gjt.mm.mysql.jdbc2.optional` package, and (initial) implementations of `PooledConnectionDataSource` and `XADataSource` are in place (thanks to Todd Wolff for the implementation and testing of `PooledConnectionDataSource` with IBM WebSphere 4).
- Fixed quoting error with escape processor (bug 486265).
- Removed concatenation support from driver (the `||` operator), as older versions of VisualAge seem to be the only thing that use it, and it conflicts with the logical `||` operator. You will need to start `mysqld` with the `--ansi` flag to use the `||` operator as concatenation (bug 491680).
- `Ant` build was corrupting included `jar` files, fixed (bug 487669).
- Report batch update support through `DatabaseMetaData` (bug 495101).
- Implementation of `DatabaseMetaData.getExported/ImportedKeys()` and `getCrossReference()`.
- Fixed off-by-one-hour error in `PreparedStatement.setTimestamp()` (bug 491577).
- Full synchronization on methods modifying instance and class-shared references, driver should be entirely thread-safe now (please let me know if you have problems).

E.6.5.7. Changes in MySQL Connector/J 2.0.8 (25 November 2001)

Bugs fixed:

- `XADataSource/ConnectionPoolDataSource` code (experimental)
- `DatabaseMetaData.getPrimaryKeys()` and `getBestRowIdentifier()` are now more robust in identifying primary keys (matches regardless of case or abbreviation/full spelling of `Primary Key` in `Key_type` column).
- Batch updates now supported (thanks to some inspiration from Daniel Rall).
- `PreparedStatement.setAnyNumericType()` now handles positive exponents correctly (adds `+` so MySQL can understand it).

E.6.5.8. Changes in MySQL Connector/J 2.0.7 (24 October 2001)

Bugs fixed:

- Character sets read from database if `useUnicode=true` and `characterEncoding` is not set. (thanks to Dmitry Vereshchagin)
- Initial transaction isolation level read from database (if available). (thanks to Dmitry Vereshchagin)
- Fixed `PreparedStatement` generating SQL that would end up with syntax errors for some queries.
- `PreparedStatement.setCharacterStream()` now implemented
- Capitalize type names when `capitalizeTypeNames=true` is passed in URL or properties (for WebObjects. (thanks to Anjo Krank)
- `ResultSet.getBlob()` now returns `null` if column value was `null`.
- Fixed `ResultSetMetaData.getPrecision()` returning one less than actual on newer versions of MySQL.
- Fixed dangling socket problem when in high availability (`autoReconnect=true`) mode, and finalizer for `Connection` will close any dangling sockets on GC.
- Fixed time zone issue in `PreparedStatement.setTimestamp()`. (thanks to Erik Olofsson)
- `PreparedStatement.setDouble()` now uses full-precision doubles (reverting a fix made earlier to truncate them).
- Fixed `DatabaseMetaData.supportsTransactions()`, and `supportsTransactionIsolationLevel()` and `getTypeInfo()` `SQL_DATETIME_SUB` and `SQL_DATA_TYPE` fields not being readable.

- Updatable result sets now correctly handle `NULL` values in fields.
- `PreparedStatement.setBoolean()` will use 1/0 for values if your MySQL version is 3.21.23 or higher.
- Fixed `ResultSet.isAfterLast()` always returning `false`.

E.6.5.9. Changes in MySQL Connector/J 2.0.6 (16 June 2001)

Bugs fixed:

- Fixed `PreparedStatement` parameter checking.
- Fixed case-sensitive column names in `ResultSet.java`.

E.6.5.10. Changes in MySQL Connector/J 2.0.5 (13 June 2001)

Bugs fixed:

- `ResultSet.insertRow()` works now, even if not all columns are set (they will be set to `NULL`).
- Added `Byte` to `PreparedStatement.setObject()`.
- Fixed data parsing of `TIMESTAMP` values with 2-digit years.
- Added `ISOLATION` level support to `Connection.setIsolationLevel()`
- `DatabaseMetaData.getCrossReference()` no longer `ArrayIndexOOB`.
- `ResultSet.getBoolean()` now recognizes `-1` as `true`.
- `ResultSet` has `+/-Inf/inf` support.
- `getObject()` on `ResultSet` correctly does `TINYINT->Byte` and `SMALLINT->Short`.
- Fixed `ResultSetMetaData.getColumnTypeName` for `TEXT/BLOB`.
- Fixed `ArrayIndexOutOfBoundsException` when sending large `BLOB` queries. (Max size packet was not being set)
- Fixed NPE on `PreparedStatement.executeUpdate()` when all columns have not been set.
- Fixed `ResultSet.getBlob()` `ArrayIndex` out-of-bounds.

E.6.5.11. Changes in MySQL Connector/J 2.0.3 (03 December 2000)

Bugs fixed:

- Fixed composite key problem with updatable result sets.
- Faster ASCII string operations.
- Fixed off-by-one error in `java.sql.Blob` implementation code.
- Fixed incorrect detection of `MAX_ALLOWED_PACKET`, so sending large blobs should work now.
- Added detection of `-/+INF` for doubles.
- Added `ultraDevHack` URL parameter, set to `true` to allow (broken) Macromedia UltraDev to use the driver.
- Implemented `getBigDecimal()` without scale component for JDBC2.

E.6.5.12. Changes in MySQL Connector/J 2.0.1 (06 April 2000)

Bugs fixed:

- Columns that are of type `TEXT` now return as `Strings` when you use `getObject()`.
- Cleaned up exception handling when driver connects.
- Fixed `RSMD.isWritable()` returning wrong value. Thanks to Moritz Maass.
- `DatabaseMetaData.getPrimaryKeys()` now works correctly with respect to `key_seq`. Thanks to Brian Slesinsky.
- Fixed many JDBC-2.0 traversal, positioning bugs, especially with respect to empty result sets. Thanks to Ron Smits, Nick Brook, Cessar Garcia and Carlos Martinez.
- No escape processing is done on `PreparedStatement` anymore per JDBC spec.
- Fixed some issues with updatability support in `ResultSet` when using multiple primary keys.

E.6.5.13. Changes in MySQL Connector/J 2.0.0pre5 (21 February 2000)

- Fixed Bad Handshake problem.

E.6.5.14. Changes in MySQL Connector/J 2.0.0pre4 (10 January 2000)

- Fixes to `ResultSet` for `insertRow()` - Thanks to Cesar Garcia
- Fix to Driver to recognize JDBC-2.0 by loading a JDBC-2.0 class, instead of relying on JDK version numbers. Thanks to John Baker.
- Fixed `ResultSet` to return correct row numbers
- `Statement.getUpdateCount()` now returns rows matched, instead of rows actually updated, which is more SQL-92 like.

10-29-99

- `Statement/PreparedStatement.getMoreResults()` bug fixed. Thanks to Noel J. Bergman.
- Added `Short` as a type to `PreparedStatement.setObject()`. Thanks to Jeff Crowder
- Driver now automagically configures maximum/preferred packet sizes by querying server.
- Autoreconnect code uses fast ping command if server supports it.
- Fixed various bugs with respect to packet sizing when reading from the server and when alloc'ing to write to the server.

E.6.5.15. Changes in MySQL Connector/J 2.0.0pre (17 August 1999)

- Now compiles under JDK-1.2. The driver supports both JDK-1.1 and JDK-1.2 at the same time through a core set of classes. The driver will load the appropriate interface classes at runtime by figuring out which JVM version you are using.
- Fixes for result sets with all nulls in the first row. (Pointed out by Tim Endres)
- Fixes to column numbers in `SQLExceptions` in `ResultSet` (Thanks to Blas Rodriguez Somoza)
- The database no longer needs to be specified to connect. (Thanks to Christian Motschke)

E.6.6. Changes in MySQL Connector/J 1.2b (04 July 1999)

- Better Documentation (in progress), in `doc/mm.doc/book1.html`
- `DBMD` now allows null for a column name pattern (not in spec), which it changes to `'%'`.
- `DBMD` now has correct types/lengths for `getXXX()`.

- `ResultSet.getDate()`, `getTime()`, and `getTimestamp()` fixes. (contributed by Alan Wilken)
- `EscapeProcessor` now handles `\{ \}` and `{ or }` inside quotes correctly. (thanks to Alik for some ideas on how to fix it)
- Fixes to properties handling in `Connection`. (contributed by Juho Tikkala)
- `ResultSet.getObject()` now returns null for NULL columns in the table, rather than bombing out. (thanks to Ben Grosman)
- `ResultSet.getObject()` now returns Strings for types from MySQL that it doesn't know about. (Suggested by Chris Perdue)
- Removed `DataInput/Output` streams, not needed, 1/2 number of method calls per IO operation.
- Use default character encoding if one is not specified. This is a work-around for broken JVMs, because according to spec, EVERY JVM must support "ISO8859_1", but they don't.
- Fixed `Connection` to use the platform character encoding instead of "ISO8859_1" if one isn't explicitly set. This fixes problems people were having loading the character- converter classes that didn't always exist (JVM bug). (thanks to Fritz Elfert for pointing out this problem)
- Changed `MysqlIO` to re-use packets where possible to reduce memory usage.
- Fixed escape-processor bugs pertaining to `{ }` inside quotes.

E.6.7. Changes in MySQL Connector/J 1.2.x and lower

E.6.7.1. Changes in MySQL Connector/J 1.2a (14 April 1999)

- Fixed character-set support for non-Javasoft JVMs (thanks to many people for pointing it out)
- Fixed `ResultSet.getBoolean()` to recognize 'y' & 'n' as well as '1' & '0' as boolean flags. (thanks to Tim Pizey)
- Fixed `ResultSet.getTimestamp()` to give better performance. (thanks to Richard Swift)
- Fixed `getBytes()` for numeric types. (thanks to Ray Bellis)
- Fixed `DatabaseMetaData.getTypeInfo()` for DATE type. (thanks to Paul Johnston)
- Fixed `EscapeProcessor` for "fn" calls. (thanks to Piyush Shah at locomotive.org)
- Fixed `EscapeProcessor` to not do extraneous work if there are no escape codes. (thanks to Ryan Gustafson)
- Fixed `Driver` to parse URLs of the form "jdbc:mysql://host:port" (thanks to Richard Lobb)

E.6.7.2. Changes in MySQL Connector/J 1.1i (24 March 1999)

- Fixed Timestamps for `PreparedStatement`s
- Fixed null pointer exceptions in `RSMD` and `RS`
- Re-compiled with jikes for valid class files (thanks ms!)

E.6.7.3. Changes in MySQL Connector/J 1.1h (08 March 1999)

- Fixed escape processor to deal with unmatched `{` and `}` (thanks to Craig Coles)
- Fixed escape processor to create more portable (between DATETIME and TIMESTAMP types) representations so that it will work with BETWEEN clauses. (thanks to Craig Longman)
- `MysqlIO.quit()` now closes the socket connection. Before, after many failed connections some OS's would run out of file descriptors. (thanks to Michael Brinkman)
- Fixed `NullPointerException` in `Driver.getPropertyInfo`. (thanks to Dave Potts)
- Fixes to `MysqlDefs` to allow all *text fields to be retrieved as Strings. (thanks to Chris at Leverage)

- Fixed setDouble in PreparedStatement for large numbers to avoid sending scientific notation to the database. (thanks to J.S. Ferguson)
- Fixed getScale() and getPrecision() in RSMD. (contrib'd by James Klicman)
- Fixed getObject() when field was DECIMAL or NUMERIC (thanks to Bert Hobbs)
- DBMD.getTableNames() bombed when passed a null table-name pattern. Fixed. (thanks to Richard Lobb)
- Added check for "client not authorized" errors during connect. (thanks to Hannes Wallnoefer)

E.6.7.4. Changes in MySQL Connector/J 1.1g (19 February 1999)

- Result set rows are now byte arrays. Blobs and Unicode work bidirectionally now. The useUnicode and encoding options are implemented now.
- Fixes to PreparedStatement to send binary set by setXXXStream to be sent untouched to the MySQL server.
- Fixes to getDriverPropertyInfo().

E.6.7.5. Changes in MySQL Connector/J 1.1f (31 December 1998)

- Changed all ResultSet fields to Strings, this should allow Unicode to work, but your JVM must be able to convert between the character sets. This should also make reading data from the server be a bit quicker, because there is now no conversion from StringBuffer to String.
- Changed PreparedStatement.streamToString() to be more efficient (code from Uwe Schaefer).
- URL parsing is more robust (throws SQL exceptions on errors rather than NullPointerExceptions)
- PreparedStatement now can convert Strings to Time/Date values via setObject() (code from Robert Currey).
- IO no longer hangs in Buffer.readInt(), that bug was introduced in 1.1d when changing to all byte-arrays for result sets. (Pointed out by Samo Login)

E.6.7.6. Changes in MySQL Connector/J 1.1b (03 November 1998)

- Fixes to DatabaseMetaData to allow both IBM VA and J-Builder to work. Let me know how it goes. (thanks to Jac Kersing)
- Fix to ResultSet.getBoolean() for NULL strings (thanks to Barry Lagerweij)
- Beginning of code cleanup, and formatting. Getting ready to branch this off to a parallel JDBC-2.0 source tree.
- Added "final" modifier to critical sections in MysqlIO and Buffer to allow compiler to inline methods for speed.

9-29-98

- If object references passed to setXXX() in PreparedStatement are null, setNull() is automatically called for you. (Thanks for the suggestion goes to Erik Ostrom)
- setObject() in PreparedStatement will now attempt to write a serialized representation of the object to the database for objects of Types.OTHER and objects of unknown type.
- Util now has a static method readObject() which given a ResultSet and a column index will re-instantiate an object serialized in the above manner.

E.6.7.7. Changes in MySQL Connector/J 1.1 (02 September 1998)

- Got rid of "ugly hack" in MysqlIO.nextRow(). Rather than catch an exception, Buffer.isLastDataPacket() was fixed.
- Connection.getCatalog() and Connection.setCatalog() should work now.

- `Statement.setMaxRows()` works, as well as setting by property `maxRows`. `Statement.setMaxRows()` overrides `maxRows` set via properties or url parameters.
- Automatic re-connection is available. Because it has to "ping" the database before each query, it is turned off by default. To use it, pass in "autoReconnect=true" in the connection URL. You may also change the number of reconnect tries, and the initial timeout value via "maxReconnects=n" (default 3) and "initialTimeout=n" (seconds, default 2) parameters. The timeout is an exponential backoff type of timeout; for example, if you have initial timeout of 2 seconds, and maxReconnects of 3, then the driver will timeout 2 seconds, 4 seconds, then 16 seconds between each re-connection attempt.

E.6.7.8. Changes in MySQL Connector/J 1.0 (24 August 1998)

- Fixed handling of blob data in `Buffer.java`
- Fixed bug with authentication packet being sized too small.
- The JDBC Driver is now under the LPGL

8-14-98

- Fixed `Buffer.readLenString()` to correctly read data for BLOBS.
- Fixed `PreparedStatement.toStringStream` to correctly read data for BLOBS.
- Fixed `PreparedStatement.setDate()` to not add a day. (above fixes thanks to Vincent Partington)
- Added URL parameter parsing (`?user=...` and so forth).

E.6.7.9. Changes in MySQL Connector/J 0.9d (04 August 1998)

- Big news! New package name. Tim Endres from ICE Engineering is starting a new source tree for GNU GPL'd Java software. He's graciously given me the `org.gjt.mm` package directory to use, so now the driver is in the `org.gjt.mm.mysql` package scheme. I'm "legal" now. Look for more information on Tim's project soon.
- Now using dynamically sized packets to reduce memory usage when sending commands to the DB.
- Small fixes to `getTypeInfo()` for parameters, and so forth.
- `DatabaseMetaData` is now fully implemented. Let me know if these drivers work with the various IDEs out there. I've heard that they're working with JBuilder right now.
- Added JavaDoc documentation to the package.
- Package now available in `.zip` or `.tar.gz`.

E.6.7.10. Changes in MySQL Connector/J 0.9 (28 July 1998)

- Implemented `getTypeInfo()`. `Connection.rollback()` now throws an `SQLException` per the JDBC spec.
- Added `PreparedStatement` that supports all JDBC API methods for `PreparedStatement` including `InputStreams`. Please check this out and let me know if anything is broken.
- Fixed a bug in `ResultSet` that would break some queries that only returned 1 row.
- Fixed bugs in `DatabaseMetaData.getTables()`, `DatabaseMetaData.getColumns()` and `DatabaseMetaData.getCatalogs()`.
- Added functionality to `Statement` that allows `executeUpdate()` to store values for IDs that are automatically generated for `AUTO_INCREMENT` fields. Basically, after an `executeUpdate()`, look at the `SQLWarnings` for warnings like "LAST_INSERTED_ID = 'some number', COMMAND = 'your SQL query'". If you are using `AUTO_INCREMENT` fields in your tables and are executing a lot of `executeUpdate(s)` on one `Statement`, be sure to `clearWarnings()` every so often to save memory.

E.6.7.11. Changes in MySQL Connector/J 0.8 (06 July 1998)

- Split `MysqlIO` and `Buffer` to separate classes. Some `ClassLoaders` gave an `IllegalAccess` error for some fields in those two classes. Now `mm.mysql` works in applets and all classloaders. Thanks to Joe Ennis <jce@mail.boone.com> for pointing out the problem and working on a fix with me.

E.6.7.12. Changes in MySQL Connector/J 0.7 (01 July 1998)

- Fixed `DatabaseMetadata` problems in `getColumns()` and bug in switch statement in the `Field` constructor. Thanks to Costin Manolache <costin@tdiinc.com> for pointing these out.

E.6.7.13. Changes in MySQL Connector/J 0.6 (21 May 1998)

- Incorporated efficiency changes from Richard Swift <Richard.Swift@kanatek.ca> in `MysqlIO.java` and `ResultSet.java`:
- We're now 15% faster than gwe's driver.
- Started working on `DatabaseMetaData`.
- The following methods are implemented:
 - `getTables()`
 - `getTableTypes()`
 - `getColumns`
 - `getCatalogs()`

E.7. MySQL Connector/MXJ Change History

E.7.1. Changes in MySQL Connector/MXJ 5.0.6 (04 May 2007)

Bugs fixed:

- Changed tests to shutdown `mysqld` prior to deleting files.
- Fixed port file to always be written to `datadir`.
- Added `os.name-os.arch` to resource directory mapping properties file.
- Swapped out commercial binaries for v5.0.40.
- Delete `portFile` on shutdown.
- Moved `platform-map.properties` into `db-files.jar`.
- Clarified the startup max wait numbers.
- Updated `build.xml` in preparation for next beta build.
- Removed `use-default-architecture` property replaced.

E.7.2. Changes in MySQL Connector/MXJ 5.0.5 (14 March 2007)

Bugs fixed:

- Moved `MysqlFactory` to main package.
- Reformatting: Added newlines some files which did not end in them.
- Swapped out commercial binaries for v5.0.36.

- Found and removed dynamic linking in `mysql_kill`; updated solution.
- Changed protected constructor of `SimpleMysqldDynamicMBean` from taking a `MysqldResource` to taking a `MysqldFactory`, in order to lay groundwork for addressing BUG discovered by Andrew Rubinger. See: [MySQL Forums](#) (Actual testing with JBoss, and filing a bug, is still required.)
- `build.xml: usage` now slightly more verbose; some reformatting.
- Now incorporates Reggie Bennett's `SafeTerminateProcess` and only calls the unsafe `TerminateProcess` as a final last resort.
- New windows `kill.exe` fixes bug where `mysqld` was being force terminated. Issue reported by bruno haleblan and others, see: [MySQL Forums](#).
- Replaced `Boolean.parseBoolean` with JDK 1.4 compliant `valueOf`.
- Changed `connector-mxj.properties` default `mysql` version to 5.0.37.
- In testing so far `mysqld` reliably shuts down cleanly much faster.
- Added testcase to `com.mysql.management.jmx.AcceptanceTest` which demonstrates that `dataDir` is a mutable MBean property.
- Updated `build.xml` in prep for next release.
- Changed `SimpleMysqldDynamicMBean` to create `MysqldResource` on demand in order to allow setting of `datadir`. (Rubinger bug groundwork).
- Clarified the synchronization of `MysqldResource` methods.
- `SIGHUP` is replaced with `MySQLShutdown<PID>` event.
- Clarified the immutability of `baseDir`, `dataDir`, `pidFile`, `portFile`.
- Added 5.1.15 binaries to the repository.
- Removed 5.1.14 binaries from the repository.
- Added `getDataDir()` to interface `MysqldResourceI`.
- Added 5.1.14 binaries to repository.
- Replaced windows `kill.exe` resource with re-written version specific to `mysqld`.
- Added Patched `StandardSocketFactory` from Connector/J 5-0 HEAD.
- Ensured 5.1.14 compatibility.
- Swapped out gpl binaries for v5.0.37.
- Removed 5.0.22 binaries from the repository.

E.7.3. Changes in MySQL Connector/MXJ 5.0.4 (28 January 2007)

Bugs fixed:

- Allow multiple calls to start server from URL connection on non-3306 port. ([Bug#24004](#))
- Updated `build.xml` to build to handle with different gpl and commercial `mysld` version numbers.
- Only populate the options map from the help text if specifically requested or in the MBean case.
- Introduced property for Linux & WinXX to default to 32bit versions.
- Swapped out gpl binaries for v5.0.27.
- Swapped out commercial binaries for v5.0.32.
- Moved `mysqld` binary resourced into separate jar file NOTICE: `CLASSPATH` will now need to `connector-`

`mxj-db-files.jar`.

- Minor test robustness improvements.
- Moved default version string out of java class into a text editable properties file (`connector-mxj.properties`) in the resources directory.
- Fixed test to be tollerant of `/tmp` being a symlink to `/foo/tmp`.

E.7.4. Changes in MySQL Connector/MXJ 5.0.3 (24 June 2006)

Bugs fixed:

- Removed unused imports, formatted code, made minor edits to tests.
- Removed "TeeOutputStream" - no longer needed.
- Swapped out the mysqld binaries for MySQL v5.0.22.

E.7.5. Changes in MySQL Connector/MXJ 5.0.2 (15 June 2006)

Bugs fixed:

- Replaced string parsing with JDBC connection attempt for determining if a mysqld is "ready for connections" `CLASSPATH` will now need to include Connector/J jar.
- "platform" directories replace spaces with underscores
- extracted array and list printing to ListToString utility class
- Swapped out the mysqld binaries for MySQL v5.0.21
- Added trace level logging with Aspect/J. `CLASSPATH` will now need to include `lib/aspectjrt.jar`
- reformatted code
- altered to be "basedir" rather than "port" oriented.
- help parsing test reflects current help options
- insulated users from problems with "." in basedir
- swapped out the mysqld binaries for MySQL v5.0.18
- Made tests more robust by deleting the `/tmp/test-c.mxj` directory before running tests.
- ServerLauncherSocketFactory.shutdown API change: now takes File parameter (basedir) instead of port.
- socket is now "mysql.sock" in datadir
- added ability to specify "mysql-version" as an url parameter
- Extended timeout for help string parsing, to avoid cases where the help text was getting prematurely flushed, and thus truncated.
- swapped out the mysqld binaries for MySQL v5.0.19
- MysqldResource now tied to dataDir as well as basedir (API CHANGE)
- moved PID file into datadir
- ServerLauncherSocketFactory.shutdown now works across JVMs.
- extracted splitLines(String) to Str utility class
- ServerLauncherSocketFactory.shutdown(port) no longer throws, only reports to System.err

- `ServerLauncherSocketFactory` now treats URL parameters in the form of `&server.foo=null` as `serverOption-Map.put("foo", null)`
- `ServerLauncherSocketFactory.shutdown` API change: now takes 2 File parameters (`basedir`, `datadir`)

E.7.6. Changes in MySQL Connector/MXJ 5.0.1 (Never released)

This was an internal only release.

E.7.7. Changes in MySQL Connector/MXJ 5.0.0 (09 December 2005)

Bugs fixed:

- Removed `HelpOptionsParser`'s need to reference a `MysqldResource`.
- Reorganized utils into a single "Utils" collaborator.
- Minor test tweaks
- Altered examples and tests to use new Connector/J 5.0 URL syntax for launching Connector/MXJ ("`jdbc:mysql:mxj://`")
- Swapped out the `mysqld` binaries for MySQL v5.0.16.
- Ditched "ClassUtil" (merged with `Str`).
- Minor refactorings for type casting and exception handling.

E.8. MySQL Proxy Change History

E.8.1. Changes in MySQL MySQL Proxy 0.6.0 (Not yet released)

Functionality added or changed:

- When using read/write splitting and the `rw-splitting.lua` example script, connecting a second user to the proxy returns an error message. ([Bug#30867](#))
- Added support in `read_query_result()` to overwrite the result-set.
- Added `--no-daemon` and `--pid-file`.
- Added hooks for `read_auth()`, `read_handshake()` and `read_auth_result()`.
- Added handling of `proxy.connection.backend_ndx` in `connect_server()` and `read_query()` to support read/write splitting.
- Added support for `proxy.response.packets`.
- Added testcases.
- Added `--no-proxy` to disable the proxy.
- Added support for listening UNIX sockets.
- Added a global lua-scope `proxy.global.*`.
- Added connection pooling.

Bugs fixed:

- Fixed assertion on `COM_BINLOG_DUMP`. ([Bug#29764](#))
- Fixed assertion on result-packets like `[field-len | fields | EOF | ERR]`. ([Bug#29732](#))
- Fixed assertion at login with empty password + empty default db. ([Bug#29719](#))

- Fixed assertion at `COM_SHUTDOWN`. (Bug#29719)
- Fixed crash if `proxy.connection` is used in `connect_server()`.
- Fixed check for `glib2` to require at least 2.6.0.
- Fixed assertion when all backends are down and we try to connect.
- Fixed connection-stalling if `read_query_result()` throws an `assert()` ion.
- Fixed len-encoding on `proxy.resultsets`.
- Fixed compilation on win32.
- Fixed assertion when connecting to the MySQL 6.0.1.
- Fixed decoding of len-encoded ints for 3-byte notation.
- Fixed `inj.resultset.affected_rows` on `SELECT` queries.
- Fixed handling of (SQL) `NULL` in result-sets.
- Fixed mem-leak with `proxy.response.*` is used.

E.8.2. Changes in MySQL MySQL Proxy 0.5.1 (30 June 2007)

Functionality added or changed:

- Added `resultset.affected_rows` and `resultset.insert_id`.
- Changed `--proxy.profiling` to `--proxy-skip-profiling`.
- Added missing dependency to `libmysqlclient-dev` to the `INSTALL` file.
- Added `inj.query_time` and `inj.response_time` into the lua scripts.
- Added support for pre-4.1 passwords in a 4.1 connection.
- Added script examples for rewriting and injection.
- Added `proxy.VERSION`.
- Added support for UNIX sockets.
- Added protection against duplicate resultsets from a script.

Bugs fixed:

- Fixed mysql check in configure to die when `mysql.h` isn't detected.
- Fixed handling of duplicate ERR on `COM_CHANGE_USER` in MySQL 5.1.18+.
- Fixed compile error with MySQL 4.1.x on missing `COM_STMT_*`.
- Fixed crash on fields > 250 bytes when the resultset is inspected.
- Fixed warning if `connect_server()` is not provided.
- Fixed assertion when a error occurs at initial script exec time.
- Fixed assertion when `read_query_result()` is not provided when `PROXY_SEND_QUERY` is used.

E.8.3. Changes in MySQL MySQL Proxy 0.5.0 (19 June 2007)

This is the first beta release.

Bugs fixed:

- Added [automake/autoconf](#) support.
- Added [cmake](#) support.

Appendix F. Limits and Restrictions

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries or views.

F.1. Restrictions on Stored Routines and Triggers

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. Some of restrictions apply only to stored functions, and not to stored procedures.

All of the restrictions for stored functions also apply to triggers.

Stored routines cannot contain arbitrary SQL statements. The following statements are disallowed:

- The table-maintenance statements `CHECK TABLES` and `OPTIMIZE TABLES`.

Note

This restriction is lifted beginning with MySQL 5.0.17.

- The locking statements `LOCK TABLES`, `UNLOCK TABLES`.
- `LOAD DATA` and `LOAD TABLE`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`). Implication: You cannot use dynamic SQL within stored routines (where you construct dynamically statements as strings and then execute them). This restriction is lifted as of MySQL 5.0.13 for stored procedures; it still applies to stored functions and triggers.

In addition, SQL statements that are not permitted within prepared statements are also not permitted in stored routines. See [Section 12.7, “SQL Syntax for Prepared Statements”](#), for a list of statements supported in prepared statements. Statements not listed there are not supported for SQL prepared statements and thus are also not supported for stored routines unless noted otherwise in [Chapter 18, *Stored Procedures and Functions*](#).

For stored functions (but not stored procedures), the following additional statements or operations are disallowed:

- Statements that do explicit or implicit commit or rollback.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO var_list` clause and `SHOW` statements. A function can process a result set either with `SELECT ... INTO var_list` or by using a cursor and `FETCH` statements. See [Section 18.2.7.3, “SELECT ... INTO Statement”](#).
- `FLUSH` statements.

Note

Before MySQL 5.0.10, stored functions created with `CREATE FUNCTION` must not contain references to tables, with limited exceptions. They may include some `SET` statements that contain table references, for example `SET a := (SELECT MAX(id) FROM t)`, and `SELECT` statements that fetch values directly into variables, for example `SELECT i INTO var1 FROM t`.

- Recursive statements. That is, stored functions cannot be used recursively.
- Within a stored function or trigger, it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- `ALTER VIEW`.

Note that although some restrictions normally apply to stored functions and triggers but not to stored procedures, those restrictions do apply to stored procedures if they are invoked from within a stored function or trigger. For example, although you can use `FLUSH` in a stored procedure, such a stored procedure cannot be called from a stored function or trigger.

It is possible for the same identifier to be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
```

```

DECLARE i INT DEFAULT 0;
SELECT i FROM t;
BEGIN
  DECLARE i INT DEFAULT 1;
  SELECT i FROM t;
END;
END;

```

In such cases the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column
- A routine parameter takes precedence over a table column
- A local variable in an inner block takes precedence over a local variable in an outer block

The behavior that table columns do not take precedence over variables is non-standard.

Use of stored routines can cause replication problems. This issue is discussed further in [Section 18.4, “Binary Logging of Stored Routines and Triggers”](#).

`INFORMATION_SCHEMA` does not yet have a `PARAMETERS` table, so applications that need to acquire routine parameter information at runtime must use workarounds such as parsing the output of `SHOW CREATE` statements.

There are no stored routine debugging facilities.

Before MySQL 5.0.17, `CALL` statements cannot be prepared. This true both for server-side prepared statements and for SQL prepared statements.

`UNDO` handlers are not supported.

`FOR` loops are not supported.

To prevent problems of interaction between server threads, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. This means that while the statement executes, it will not see changes to routines performed by other threads.

For triggers, the following additional statements or operations are disallowed:

- Triggers currently are not activated by foreign key actions.
- The `RETURN` statement is disallowed in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not allowed on tables in the `mysql` database.

F.2. Restrictions on Server-Side Cursors

Server-side cursors are implemented beginning with the C API in MySQL 5.0.2 via the `mysql_stmt_attr_set()` function. A server-side cursor allows a result set to be generated on the server side, but not transferred to the client except for those rows that the client requests. For example, if a client executes a query but is only interested in the first row, the remaining rows are not transferred.

In MySQL, a server-side cursor is materialized into a temporary table. Initially, this is a `MEMORY` table, but is converted to a `MyISAM` table if its size reaches the value of the `max_heap_table_size` system variable. (Beginning with MySQL 5.0.14, the same temporary-table implementation also is used for cursors in stored routines.) One limitation of the implementation is that for a large result set, retrieving its rows through a cursor might be slow.

Cursors are read-only; you cannot use a cursor to update rows.

`UPDATE WHERE CURRENT OF` and `DELETE WHERE CURRENT OF` are not implemented, because updatable cursors are not supported.

Cursors are non-holdable (not held open after a commit).

Cursors are a sensitive.

Cursors are non-scrollable.

Cursors are not named. The statement handler acts as the cursor ID.

You can have open only a single cursor per prepared statement. If you need several cursors, you must prepare several statements.

You cannot use a cursor for a statement that generates a result set if the statement is not supported in prepared mode. This includes statements such as `CHECK TABLES`, `HANDLER READ`, and `SHOW BINLOG EVENTS`.

F.3. Restrictions on Subqueries

- In MySQL 5.0 before 5.0.36, if you compare a `NULL` value to a subquery using `ALL`, `ANY`, or `SOME`, and the subquery returns an empty result, the comparison might evaluate to the non-standard result of `NULL` rather than to `TRUE` or `FALSE`.
- A subquery's outer statement can be any one of: `SELECT`, `INSERT`, `UPDATE`, `DELETE`, `SET`, or `DO`.
- Subquery optimization for `IN` is not as effective as for the `=` operator or for `IN(value_list)` constructs.

A typical case for poor `IN` subquery performance is when the subquery returns a small number of rows but the outer query returns a large number of rows to be compared to the subquery result.

The problem is that, for a statement that uses an `IN` subquery, the optimizer rewrites it as a correlated subquery. Consider the following statement that uses an uncorrelated subquery:

```
SELECT ... FROM t1 WHERE t1.a IN (SELECT b FROM t2);
```

The optimizer rewrites the statement to a correlated subquery:

```
SELECT ... FROM t1 WHERE EXISTS (SELECT 1 FROM t2 WHERE t2.b = t1.a);
```

If the inner and outer queries return M and N rows, respectively, the execution time becomes on the order of $O(M \times N)$, rather than $O(M+N)$ as it would be for an uncorrelated subquery.

An implication is that an `IN` subquery can be much slower than a query written using an `IN(value_list)` construct that lists the same values that the subquery would return.

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

```
DELETE FROM t WHERE ... (SELECT ... FROM t ...);
UPDATE t ... WHERE col = (SELECT ... FROM t ...);
{INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
```

Exception: The preceding prohibition does not apply if you are using a subquery for the modified table in the `FROM` clause. Example:

```
UPDATE t ... WHERE col = (SELECT (SELECT ... FROM t...) AS _t ...);
```

Here the prohibition does not apply because the result from a subquery in the `FROM` clause is stored as a temporary table, so the relevant rows in `t` have already been selected by the time the update to `t` takes place.

- Row comparison operations are only partially supported:
 - For `expr IN (subquery)`, `expr` can be an n -tuple (specified via row constructor syntax) and the subquery can return rows of n -tuples.
 - For `expr op {ALL|ANY|SOME} (subquery)`, `expr` must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

In other words, for a subquery that returns rows of n -tuples, this is supported:

```
(val_1, ..., val_n) IN (subquery)
```

But this is not supported:

```
(val_1, ..., val_n) op {ALL|ANY|SOME} (subquery)
```

The reason for supporting row comparisons for `IN` but not for the others is that `IN` is implemented by rewriting it as a sequence

of = comparisons and [AND](#) operations. This approach cannot be used for [ALL](#), [ANY](#), or [SOME](#).

- Row constructors are not well optimized. The following two expressions are equivalent, but only the second can be optimized:

```
(col1, col2, ...) = (val1, val2, ...)
col1 = val1 AND col2 = val2 AND ...
```

- Subqueries in the [FROM](#) clause cannot be correlated subqueries. They are materialized (executed to produce a result set) before evaluating the outer query, so they cannot be evaluated per row of the outer query.
- The optimizer is more mature for joins than for subqueries, so in many cases a statement that uses a subquery can be executed more efficiently if you rewrite it as a join.

An exception occurs for the case where an [IN](#) subquery can be rewritten as a [SELECT DISTINCT](#) join. Example:

```
SELECT col FROM t1 WHERE id_col IN (SELECT id_col2 FROM t2 WHERE condition);
```

That statement can be rewritten as follows:

```
SELECT DISTINCT col FROM t1, t2 WHERE t1.id_col = t2.id_col AND condition;
```

But in this case, the join requires an extra [DISTINCT](#) operation and is not more efficient than the subquery.

- Possible future optimization: MySQL does not rewrite the join order for subquery evaluation. In some cases, a subquery could be executed more efficiently if MySQL rewrote it as a join. This would give the optimizer a chance to choose between more execution plans. For example, it could decide whether to read one table or the other first.

Example:

```
SELECT a FROM outer_table AS ot
WHERE a IN (SELECT a FROM inner_table AS it WHERE ot.b = it.b);
```

For that query, MySQL always scans [outer_table](#) first and then executes the subquery on [inner_table](#) for each row. If [outer_table](#) has a lot of rows and [inner_table](#) has few rows, the query probably will not be as fast as it could be.

The preceding query could be rewritten like this:

```
SELECT a FROM outer_table AS ot, inner_table AS it
WHERE ot.a = it.a AND ot.b = it.b;
```

In this case, we can scan the small table ([inner_table](#)) and look up rows in [outer_table](#), which will be fast if there is an index on ([ot.a](#),[ot.b](#)).

- Possible future optimization: A correlated subquery is evaluated for each row of the outer query. A better approach is that if the outer row values do not change from the previous row, do not evaluate the subquery again. Instead, use its previous result.
- Possible future optimization: A subquery in the [FROM](#) clause is evaluated by materializing the result into a temporary table, and this table does not use indexes. This does not allow the use of indexes in comparison with other tables in the query, although that might be useful.
- Possible future optimization: If a subquery in the [FROM](#) clause resembles a view to which the merge algorithm can be applied, rewrite the query and apply the merge algorithm so that indexes can be used. The following statement contains such a subquery:

```
SELECT * FROM (SELECT * FROM t1 WHERE t1.t1_col) AS _t1, t2 WHERE t2.t2_col;
```

The statement can be rewritten as a join like this:

```
SELECT * FROM t1, t2 WHERE t1.t1_col AND t2.t2_col;
```

This type of rewriting would provide two benefits:

- It avoids the use of a temporary table for which no indexes can be used. In the rewritten query, the optimizer can use indexes on [t1](#).
- It gives the optimizer more freedom to choose between different execution plans. For example, rewriting the query as a join allows the optimizer to use [t1](#) or [t2](#) first.
- Possible future optimization: For [IN](#), [= ANY](#), [<> ANY](#), [= ALL](#), and [<> ALL](#) with uncorrelated subqueries, use an in-memory hash for a result or a temporary table with an index for larger results. Example:

```
SELECT a FROM big_table AS bt
WHERE non_key_field IN (SELECT non_key_field FROM table WHERE condition)
```

In this case, we could create a temporary table:

```
CREATE TABLE t (key (non_key_field))
(SELECT non_key_field FROM table WHERE condition)
```

Then, for each row in `big_table`, do a key lookup in `t` based on `bt.non_key_field`.

F.4. Restrictions on Views

View processing is not optimized:

- It is not possible to create an index on a view.
- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

Subqueries cannot be used in the `FROM` clause of a view. This limitation will be lifted in the future.

There is a general principle that you cannot modify a table and select from the same table in a subquery. See [Section F.3, “Restrictions on Subqueries”](#).

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);
UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case the view will be stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it “at the same time.” (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying `ALGORITHM = TEMPTABLE` in the view definition.)

You can use `DROP TABLE` or `ALTER TABLE` to drop or alter a table that is used in a view definition (which invalidates the view) and no warning results from the drop or alter operation. An error occurs later when the view is used.

A view definition is “frozen” by certain statements:

- If a statement prepared by `PREPARE` refers to a view, the view contents seen each time the statement is executed later will be the contents of the view at the time it was prepared. This is true even if the view definition is changed after the statement is prepared and before it is executed. Example:

```
CREATE VIEW v AS SELECT 1;
PREPARE s FROM 'SELECT * FROM v';
ALTER VIEW v AS SELECT 2;
EXECUTE s;
```

The result returned by the `EXECUTE` statement is 1, not 2.

- If a statement in a stored routine refers to a view, the view contents seen by the statement are its contents the first time that statement is executed. For example, this means that if the statement is executed in a loop, further iterations of the statement see the same view contents, even if the view definition is changed later in the loop. Example:

```
CREATE VIEW v AS SELECT 1;
delimiter //
CREATE PROCEDURE p ()
BEGIN
  DECLARE i INT DEFAULT 0;
  WHILE i < 5 DO
    SELECT * FROM v;
    SET i = i + 1;
    ALTER VIEW v AS SELECT 2;
  END WHILE;
END;
```

```
//
delimiter ;
CALL p();
```

When the procedure `p()` is called, the `SELECT` returns 1 each time through the loop, even though the view definition is changed within the loop.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. This includes views that have `UNION` in their definition. Currently, not all views that are theoretically updatable can be updated. The initial view implementation was deliberately written this way to get usable, updatable views into MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist:

- Updatable views with subqueries anywhere other than in the `WHERE` clause. Some views that have subqueries in the `SELECT` list may be updatable.
- You cannot use `UPDATE` to update more than one underlying table of a view that is defined as a join.
- You cannot use `DELETE` to update a view that is defined as a join.

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the `CREATE VIEW` and `SELECT` privileges), that user will be unable to call `SHOW CREATE VIEW` on that object unless the user is also granted the `SHOW VIEW` privilege.

That shortcoming can lead to problems backing up a database with `mysqldump`, which may fail due to insufficient privileges. This problem is described in [Bug#22062](#).

The workaround to the problem is for the administrator to manually grant the `SHOW VIEW` privilege to users who are granted `CREATE VIEW`, since MySQL doesn't grant it implicitly when views are created.

F.5. Restrictions on XA Transactions

XA transaction support is limited to the `InnoDB` storage engine.

The MySQL XA implementation is for “external XA,” where a MySQL server acts as a Resource Manager and client programs act as Transaction Managers. “Internal XA” is not implemented. This would allow individual storage engines within a MySQL server to act as RMs, and the server itself to act as a TM. Internal XA is required for handling XA transactions that involve more than one storage engine. The implementation of internal XA is incomplete because it requires that a storage engine support two-phase commit at the table handler level, and currently this is true only for `InnoDB`.

For `XA START`, the `JOIN` and `RESUME` clauses are not supported.

For `XA END`, the `SUSPEND [FOR MIGRATE]` clause is not supported.

The requirement that the `bqual` part of the `xid` value be different for each XA transaction within a global transaction is a limitation of the current MySQL XA implementation. It is not part of the XA specification.

If an XA transaction has reached the `PREPARED` state and the MySQL server is killed (for example, with `kill -9` on Unix) or shuts down abnormally, the transaction can be continued after the server restarts. However, if the client reconnects and commits the transaction, the transaction will be absent from the binary log even though it has been committed. This means the data and the binary log have gone out of synchrony. An implication is that XA cannot be used safely together with replication.

It is possible that the server will roll back a pending XA transaction, even one that has reached the `PREPARED` state. This happens if a client connection terminates and the server continues to run, or if clients are connected and the server shuts down gracefully. (In the latter case, the server marks each connection to be terminated, and then rolls back the `PREPARED` XA transaction associated with it.) It should be possible to commit or roll back a `PREPARED` XA transaction, but this cannot be done without changes to the binary logging mechanism.

F.6. Limits in MySQL

This section lists current limits in MySQL 5.0.

F.6.1. Limits of Joins

The maximum number of tables that can be referenced in a single join is 61. This also applies to the number of tables that can be referenced in the definition of a view.

F.6.2. The Maximum Number of Columns Per Table

There is a hard limit of 4096 columns per table, but the effective maximum may be less for a given table. The exact limit depends on several interacting factors, listed in the following discussion.

- Every table has a maximum row size of 65,535 bytes. This maximum applies to all storage engines, but a given engine might have additional constraints that result in a lower effective maximum row size.

The maximum row size constrains the number of columns because the total width of all columns cannot exceed this size. For example, `utf8` characters require up to three bytes per character, so for a `CHAR(255) CHARACTER SET utf8` column, the server must allocate $255 \times 3 = 765$ bytes per value. Consequently, a table cannot contain more than $65,535 / 765 = 85$ such columns.

Storage for variable-length columns includes length bytes, which are assessed against the row size. For example, a `VARCHAR(255) CHARACTER SET utf8` column takes two bytes to store the length of the value, so each value can take up to 767 bytes.

`BLOB` and `TEXT` columns count from one to four plus eight bytes each toward the row-size limit because their contents are stored separately.

Declaring columns `NULL` can reduce the maximum number of columns allowed. `NULL` columns require additional space in the row to record whether or not their values are `NULL`.

For `MyISAM` tables, each `NULL` column takes one bit extra, rounded up to the nearest byte. The maximum row length in bytes can be calculated as follows:

```
row length = 1
             + (sum of column lengths)
             + (number of NULL columns + delete_flag + 7)/8
             + (number of variable-length columns)
```

`delete_flag` is 1 for tables with static row format. Static tables use a bit in the row record for a flag that indicates whether the row has been deleted. `delete_flag` is 0 for dynamic tables because the flag is stored in the dynamic row header.

These calculations do not apply for `InnoDB` tables, for which storage size is no different for `NULL` columns than for `NOT NULL` columns.

The following statement to create table `t1` succeeds because the columns require 32,765 + 2 bytes and 32,766 + 2 bytes, which falls within the maximum row size of 65,535 bytes:

```
mysql> CREATE TABLE t1
-> (c1 VARCHAR(32765) NOT NULL, c2 VARCHAR(32766) NOT NULL);
Query OK, 0 rows affected (0.01 sec)
```

The following statement to create table `t2` fails because the columns are `NULL` and require additional space that causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t2
-> (c1 VARCHAR(32765) NULL, c2 VARCHAR(32766) NULL);
ERROR 1118 (42000): Row size too large. The maximum row size for the
used table type, not counting BLOBs, is 65535. You have to change some
columns to TEXT or BLOBs
```

- Each table has an `.frm` file that contains the table definition. The `.frm` file size limit is fixed at 64KB. If a table definition reaches this size, no more columns can be added. The expression that checks information to be stored in the `.frm` file against the limit looks like this:

```
if (info_length+(ulong) create_fields.elements*FCOMP+288+
    n_length+int_length+com_length > 65535L || int_count > 255)
```

The relevant factors in this expression are:

- `info_length` is space needed for “screens.” This is related to MySQL's Unireg heritage.
- `create_fields.elements` is the number of columns.
- `FCOMP` is 17.
- `n_length` is the total length of all column names, including one byte per name as a separator.
- `int_length` is related to the list of values for SET and ENUM columns.

- `com_length` is the total length of column and table comments.

Thus, using long column names can reduce the maximum number of columns, as can the inclusion of `ENUM` or `SET` columns, or use of column or table comments.

- Individual storage engines might impose additional restrictions that limit table column count. Examples:
 - `InnoDB` allows no more than 1000 columns.
 - `InnoDB` restricts row size to something less than half a database page (approximately 8000 bytes), not including `VARBINARY`, `VARCHAR`, `BLOB`, or `TEXT` columns.
 - Different `InnoDB` storage formats (`COMPRESSED`, `REDUNDANT`) use different amounts of page header and trailer data, which affects the amount of storage available for rows.

Appendix G. Credits

This appendix lists the developers, contributors, and supporters that have helped to make MySQL what it is today.

G.1. Developers at MySQL AB

These are the developers that are or have been employed by MySQL AB to work on the [MySQL](#) database software, roughly in the order they started to work with us. Following each developer is a small list of the tasks that the developer is responsible for, or the accomplishments they have made. All developers are involved in support.

- Michael (Monty) Widenius
 - Lead developer and main author of the MySQL server ([mysqld](#)).
 - New functions for the string library.
 - Most of the [mysys](#) library.
 - The [ISAM](#) and [MyISAM](#) libraries (B-tree index file handlers with index compression and different record formats).
 - The [HEAP](#) library. A memory table system with our superior full dynamic hashing. In use since 1981 and published around 1984.
 - The [replace](#) program (take a look at it, it's **COOL!**).
 - Connector/ODBC (MyODBC), the ODBC driver for Windows.
 - Fixing bugs in MIT-pthreads to get it to work for MySQL Server. And also Unireg, a curses-based application tool with many utilities.
 - Porting of [mSQL](#) tools like [msqlperl](#), [DBD/DBI](#), and [DB2mysql](#).
 - Most of [crash-me](#) and the foundation for the MySQL benchmarks.
- David Axmark
 - Initial main writer of the **Reference Manual**, including enhancements to [texi2html](#).
 - Automatic Web site updating from the manual.
 - Initial Autoconf, Automake, and Libtool support.
 - Licensing.
 - Parts of all the text files. (Nowadays only the [README](#) is left. The rest ended up in the manual.)
 - Lots of testing of new features.
 - Our in-house Free Software legal expert.
 - Mailing list maintainer (who never has the time to do it right...).
 - Our original portability code (now more than 10 years old). Nowadays only some parts of [mysys](#) are left.
 - Someone for Monty to call in the middle of the night when he just got that new feature to work.
 - Chief "Open Sourcerer" (MySQL community relations).
- Jani Tolonen
 - [mysqlimport](#)
 - A lot of extensions to the command-line clients.
 - [PROCEDURE ANALYSE\(\)](#)
- Sinisa Milivojevic (now in support)
 - Compression (with [zlib](#)) in the client/server protocol.

-
- Perfect hashing for the lexical analyzer phase.
 - Multi-row `INSERT`
 - `mysqldump -e` option
 - `LOAD DATA LOCAL INFILE`
 - `SQL_CALC_FOUND_ROWS SELECT` option
 - `--max-user-connections=...` option
 - `net_read` and `net_write_timeout`
 - `GRANT/REVOKE` and `SHOW GRANTS FOR`
 - New client/server protocol for 4.0
 - `UNION` in 4.0
 - Multiple-table `DELETE/UPDATE`
 - Subqueries in the `FROM` clause (4.1).
 - User resources management
 - Initial developer of the `MySQL++` C++ API and the `MySQLGUI` client.
 - Tonu Samuel (past developer)
 - VIO interface (the foundation for the encrypted client/server protocol).
 - MySQL Filesystem (a way to use MySQL databases as files and directories).
 - The `CASE` expression.
 - The `MD5()` and `COALESCE()` functions.
 - `RAID` support for `MyISAM` tables.
 - Sasha Pachev (past developer)
 - Initial implementation of replication (up to version 4.0).
 - `SHOW CREATE TABLE`.
 - `mysql-bench`
 - Matt Wagner
 - MySQL test suite.
 - Webmaster (until 2002).
 - Miguel Solorzano (now in support)
 - Win32 development and release builds.
 - Windows NT server code.
 - WinMySQLAdmin
 - Timothy Smith (now in development)
 - Dynamic character sets support.
 - `configure`, RPMs and other parts of the build system.
 - Initial developer of `libmysqld`, the embedded server.
 - Sergei Golubchik

- Full-text search.
- Added keys to the [MERGE](#) library.
- Precision math.
- Jeremy Cole (past developer)
 - Proofreading and editing this fine manual.
 - [ALTER TABLE ... ORDER BY](#)
 - [UPDATE ... ORDER BY](#)
 - [DELETE ... ORDER BY](#)
- Indrek Siitan
 - Designing/programming of our Web interface.
 - Author of our newsletter management system.
- Jorge del Conde (past developer)
 - [MySQLCC \(MySQL Control Center\)](#)
 - Win32 development
 - Initial implementation of the Web site portals.
- Venu Anuganti (past developer)
 - MyODBC 3.51
 - New client/server protocol for 4.1 (for prepared statements).
- Arjen Lentz (also handled community, 2004-2006; now works in Support)
 - Maintainer of the MySQL Reference Manual (2001-2004).
 - Preparing the O'Reilly printed edition of the manual (2002).
- Alexander (Bar) Barkov, Alexey (Holyfoot) Botchkov, and Ramil Kalimullin
 - Spatial data (GIS) and R-Trees implementation for 4.1
 - Unicode and character sets for 4.1; documentation for same
- Oleksandr (Sanja) Byelkin
 - Query cache in 4.0
 - Implementation of subqueries (4.1).
 - Implementation of views (5.0).
- Aleksey (Walrus) Kishkin and Alexey (Ranger) Stroganov
 - Benchmarks design and analysis.
 - Maintenance of the MySQL test suite.
- Zak Greant (past employee)
 - Open Source advocate, MySQL community relations.
- Carsten Pedersen
 - The MySQL Certification program.
- Lenz Grimmer

- Production (build and release) engineering.
- Peter Zaitsev
 - [SHA1\(\)](#), [AES_ENCRYPT\(\)](#) and [AES_DECRYPT\(\)](#) functions.
 - Debugging, cleaning up various features.
- Alexander (Salle) Keremidarski
 - Support.
 - Debugging.
- Per-Erik Martin
 - Lead developer for stored procedures (5.0).
- Jim Winstead
 - Former lead Web developer.
 - Improving server, fixing bugs.
- Mark Matthews
 - Connector/J driver (Java).
- Peter Gulutzan
 - SQL standards compliance.
 - Documentation of existing MySQL code/algorithms.
 - Character set documentation.
- Guilhem Bichot
 - Replication, from [MySQL](#) version 4.0.
 - Fixed handling of exponents for [DECIMAL](#).
 - Author of [mysql_tableinfo](#).
 - Backup (in 5.1).
- Antony T. Curtis
 - Porting of the MySQL Database software to OS/2.
- Mikael Ronstrom
 - Much of the initial work on NDB Cluster until 2000. Roughly half the code base at that time. Transaction protocol, node recovery, system restart and restart code and parts of the API functionality.
 - Lead Architect, developer, debugger of NDB Cluster 1994-2004
 - Lots of optimizations
- Jonas Orelan
 - On-line Backup
 - The automatic test environment of MySQL Cluster
 - Portability Library for NDB Cluster
 - Lots of other things
- Pekka Nouisiainen

- Ordered index implementation of MySQL Cluster
- BLOB support in MySQL Cluster
- Charset support in MySQL Cluster
- Martin Skold
 - Unique index implementation of MySQL Cluster
 - Integration of NDB Cluster into MySQL
- Magnus Svensson
 - The test framework for MySQL Cluster
 - Integration of NDB Cluster into MySQL
- Tomas Ulin
 - Lots of work on configuration changes for simple installation and use of MySQL Cluster
- Konstantin Osipov
 - Prepared statements.
 - Cursors.
- Dmitri Lenev
 - Time zone support.
 - Triggers (in 5.0).

G.2. Contributors to MySQL

Although MySQL AB owns all copyrights in the [MySQL server](#) and the [MySQL manual](#), we wish to recognize those who have made contributions of one kind or another to the [MySQL distribution](#). Contributors are listed here, in somewhat random order:

- Gianmassimo Vigazzola <qwerg@mbx.vol.it> or <qwerg@tin.it>

The initial port to Win32/NT.

- Per Eric Olsson

For more or less constructive criticism and real testing of the dynamic record format.

- Irena Pancirov <irena@mail.yacc.it>

Win32 port with Borland compiler. [mysqlshutdown.exe](#) and [mysqlwatch.exe](#)

- David J. Hughes

For the effort to make a shareware SQL database. At TcX, the predecessor of MySQL AB, we started with [mSQL](#), but found that it couldn't satisfy our purposes so instead we wrote an SQL interface to our application builder Unireg. [mysqladmin](#) and [mysql](#) client are programs that were largely influenced by their [mSQL](#) counterparts. We have put a lot of effort into making the MySQL syntax a superset of [mSQL](#). Many of the API's ideas are borrowed from [mSQL](#) to make it easy to port free [mSQL](#) programs to the MySQL API. The MySQL software doesn't contain any code from [mSQL](#). Two files in the distribution ([client/insert_test.c](#) and [client/select_test.c](#)) are based on the corresponding (non-copyrighted) files in the [mSQL](#) distribution, but are modified as examples showing the changes necessary to convert code from [mSQL](#) to MySQL Server. ([mSQL](#) is copyrighted David J. Hughes.)

- Patrick Lynch

For helping us acquire <http://www.mysql.com/>.

- Fred Lindberg

For setting up gmail to handle the MySQL mailing list and for the incredible help we got in managing the MySQL mailing lists.

- Igor Romanenko <igor@frog.kiev.ua>
[mysqldump](#) (previously [msqldump](#), but ported and enhanced by Monty).
- Yuri Dario
For keeping up and extending the MySQL OS/2 port.
- Tim Bunce
Author of [mysqlhotcopy](#).
- Zarko Mocnik <zarko.mocnik@dem.si>
Sorting for Slovenian language.
- "TAMITO" <tommy@valley.ne.jp>
The `_MB` character set macros and the `ujis` and `sjis` character sets.
- Joshua Chamas <joshua@chamas.com>
Base for concurrent insert, extended date syntax, debugging on NT, and answering on the MySQL mailing list.
- Yves Carlier <Yves.Carlier@rug.ac.be>
[mysqlaccess](#), a program to show the access rights for a user.
- Rhys Jones <rhys@wales.com> (And GWE Technologies Limited)
For one of the early JDBC drivers.
- Dr Xiaokun Kelvin ZHU <X.Zhu@brad.ac.uk>
Further development of one of the early JDBC drivers and other MySQL-related Java tools.
- James Cooper <pixel@organic.com>
For setting up a searchable mailing list archive at his site.
- Rick Mehalick <Rick_Mehalick@i-o.com>
For [xmysql](#), a graphical X client for MySQL Server.
- Doug Sisk <sisk@wix.com>
For providing RPM packages of MySQL for Red Hat Linux.
- Diemand Alexander V. <axeld@vial.ethz.ch>
For providing RPM packages of MySQL for Red Hat Linux-Alpha.
- Antoni Pamies Olive <toni@readysoft.es>
For providing RPM versions of a lot of MySQL clients for Intel and SPARC.
- Jay Bloodworth <jay@pathways.sde.state.sc.us>
For providing RPM versions for MySQL 3.21.
- David Sacerdote <davids@secnet.com>
Ideas for secure checking of DNS hostnames.
- Wei-Jou Chen <jou@nematic.ieo.nctu.edu.tw>
Some support for Chinese(BIG5) characters.
- Wei He <hewei@mail.ied.ac.cn>

- A lot of functionality for the Chinese(GBK) character set.
- Jan Pazdziora <adelton@fi.muni.cz>
Czech sorting order.
 - Zeev Suraski <bourbon@netvision.net.il>
`FROM_UNIXTIME()` time formatting, `ENCRYPT()` functions, and `bison` advisor. Active mailing list member.
 - Luuk de Boer <luuk@wxs.nl>
Ported (and extended) the benchmark suite to `DBI/DBD`. Have been of great help with `crash-me` and running benchmarks. Some new date functions. The `mysql_setpermission` script.
 - Alexis Mikhailov <root@medinf.chuvashia.su>
User-defined functions (UDFs); `CREATE FUNCTION` and `DROP FUNCTION`.
 - Andreas F. Bobak <bobak@relog.ch>
The `AGGREGATE` extension to user-defined functions.
 - Ross Wakelin <R.Wakelin@march.co.uk>
Help to set up InstallShield for MySQL-Win32.
 - Jethro Wright III <jetman@li.net>
The `libmysql.dll` library.
 - James Pereria <jpereira@iafrica.com>
Mysqlmanager, a Win32 GUI tool for administering MySQL Servers.
 - Curt Sampson <cjs@portal.ca>
Porting of MIT-pthreads to NetBSD/Alpha and NetBSD 1.3/i386.
 - Martin Ramsch <m.ramsch@computer.org>
Examples in the MySQL Tutorial.
 - Steve Harvey
For making `mysqlaccess` more secure.
 - Konark IA-64 Centre of Persistent Systems Private Limited
<http://www.pspl.co.in/konark/>. Help with the Win64 port of the MySQL server.
 - Albert Chin-A-Young.
Configure updates for Tru64, large file support and better TCP wrappers support.
 - John Birrell
Emulation of `pthread_mutex()` for OS/2.
 - Benjamin Pflugmann
Extended `MERGE` tables to handle `INSERTS`. Active member on the MySQL mailing lists.
 - Jocelyn Fournier
Excellent spotting and reporting innumerable bugs (especially in the MySQL 4.1 subquery code).
 - Marc Liyanage
Maintaining the Mac OS X packages and providing invaluable feedback on how to create Mac OS X PKGs.

- Robert Rutherford

Providing invaluable information and feedback about the QNX port.

- Previous developers of NDB Cluster

Lots of people were involved in various ways summer students, master thesis students, employees. In total more than 100 people so too many to mention here. Notable name is Ataullah Dabaghi who up until 1999 contributed around a third of the code base. A special thanks also to developers of the AXE system which provided much of the architectural foundations for NDB Cluster with blocks, signals and crash tracing functionality. Also credit should be given to those who believed in the ideas enough to allocate of their budgets for its development from 1992 to present time.

Other contributors, bugfinders, and testers: James H. Thompson, Maurizio Menghini, Wojciech Tryc, Luca Berra, Zarko Mocnik, Wim Bonis, Elmar Haneke, <jehamby@lightside>, <psmith@BayNetworks.com>, <duane@connect.com.au>, Ted Deppner <ted@psyber.com>, Mike Simons, Jaakko Hyvatti.

And lots of bug report/patches from the folks on the mailing list.

A big tribute goes to those that help us answer questions on the MySQL mailing lists:

- Daniel Koch <dkoch@amcity.com>

Irix setup.

- Luuk de Boer <luuk@wxs.nl>

Benchmark questions.

- Tim Sailer <tps@users.buoy.com>

DBD: :mysql questions.

- Boyd Lynn Gerber <gerberb@zenez.com>

SCO-related questions.

- Richard Mehalick <RM186061@shellus.com>

xmysql-related questions and basic installation questions.

- Zeev Suraski <bourbon@netvision.net.il>

Apache module configuration questions (log & auth), PHP-related questions, SQL syntax-related questions and other general questions.

- Francesc Guasch <frankie@citel.upc.es>

General questions.

- Jonathan J Smith <jsmith@wtp.net>

Questions pertaining to OS-specifics with Linux, SQL syntax, and other things that might need some work.

- David Sklar <sklar@student.net>

Using MySQL from PHP and Perl.

- Alistair MacDonald <A.MacDonald@uel.ac.uk>

Is flexible and can handle Linux and perhaps HP-UX. Tries to get users to use [mysqlbug](#).

- John Lyon <jlyon@imag.net>

Questions about installing MySQL on Linux systems, using either [.rpm](#) files or compiling from source.

- Lorvid Ltd. <lorvid@WOLFENET.com>

Simple billing/license/support/copyright issues.

- Patrick Sherrill <patrick@coconet.com>

ODBC and VisualC++ interface questions.

- Randy Harmon <rjharmon@uptimecomputers.com>

DBD, Linux, some SQL syntax questions.

G.3. Documenters and translators

The following people have helped us with writing the MySQL documentation and translating the documentation or error messages in MySQL.

- Paul DuBois

Ongoing help with making this manual correct and understandable. That includes rewriting Monty's and David's attempts at English into English as other people know it.

- Kim Aldale

Helped to rewrite Monty's and David's early attempts at English into English.

- Michael J. Miller Jr. <mke@terrapin.turbolift.com>

For the first MySQL manual. And a lot of spelling/language fixes for the FAQ (that turned into the MySQL manual a long time ago).

- Yan Cailin

First translator of the MySQL Reference Manual into simplified Chinese in early 2000 on which the Big5 and HK coded (<http://mysql.hitstar.com/>) versions were based. [Personal home page at linuxdb.yeah.net](#).

- Jay Flaherty <fty@mediapulse.com>

Big parts of the Perl DBI/DBD section in the manual.

- Paul Southworth <pauls@etext.org>, Ray Loyzaga <yar@cs.su.oz.au>

Proof-reading of the Reference Manual.

- Therrien Gilbert <gilbert@ican.net>, Jean-Marc Pouyot <jmp@scaltaire.fr>

French error messages.

- Petr Snajdr, <snajdr@pvt.net>

Czech error messages.

- Jaroslaw Lewandowski <jotel@itnet.com.pl>

Polish error messages.

- Miguel Angel Fernandez Roiz

Spanish error messages.

- Roy-Magne Mo <rmo@www.hivolda.no>

Norwegian error messages and testing of MySQL 3.21.xx.

- Timur I. Bakeyev <root@timur.tatarstan.ru>

Russian error messages.

- <brenno@dewinter.com> & Filippo Grassilli <phil@hyppo.com>

Italian error messages.

- Dirk Munzinger <dirk@trinity.saar.de>

German error messages.

- Billik Stefan <billik@sun.uniag.sk>

Slovak error messages.

- Stefan Saroiu <tzoompy@cs.washington.edu>

Romanian error messages.

- Peter Feher

Hungarian error messages.

- Roberto M. Serqueira

Portuguese error messages.

- Carsten H. Pedersen

Danish error messages.

- Arjen Lentz

Dutch error messages, completing earlier partial translation (also work on consistency and spelling).

G.4. Libraries used by and included with MySQL

The following is a list of the creators of the libraries we have included with the MySQL server source to make it easy to compile and install MySQL. We are very thankful to all individuals that have created these and it has made our life much easier.

- Fred Fish

For his excellent C debugging and trace library. Monty has made a number of smaller improvements to the library (speed and additional options).

- Richard A. O'Keefe

For his public domain string library.

- Henry Spencer

For his regex library, used in `WHERE column REGEXP regexp`.

- Chris Provenzano

Portable user level pthreads. From the copyright: This product includes software developed by Chris Provenzano, the University of California, Berkeley, and contributors. We are currently using version 1_60_beta6 patched by Monty (see [mit-pthreads/Changes-mysql](#)).

- Jean-loup Gailly and Mark Adler

For the zlib library (used on MySQL on Windows).

- Bjorn Benson

For his `safe_malloc` (memory checker) package which is used in when you configure MySQL with `--debug`.

- Free Software Foundation

The `readline` library (used by the `mysql` command-line client).

- The NetBSD foundation

The `libedit` package (optionally used by the `mysql` command-line client).

G.5. Packages that support MySQL

The following is a list of creators/maintainers of some of the most important API/packages/applications that a lot of people use with MySQL.

We can't list every possible package here because the list would then be way to hard to maintain. For other packages, please refer to the software portal at <http://solutions.mysql.com/software/>.

- Tim Bunce, Alligator Descartes
For the `DBD` (Perl) interface.
- Andreas Koenig <a.koenig@mind.de>
For the Perl interface for MySQL Server.
- Jochen Wiedmann <wiedmann@neckar-alb.de>
For maintaining the Perl `DBD::mysql` module.
- Eugene Chan <eugene@acenet.com.sg>
For porting PHP for MySQL Server.
- Georg Richter
MySQL 4.1 testing and bug hunting. New PHP 5.0 `mysqli` extension (API) for use with MySQL 4.1 and up.
- Giovanni Maruzzelli <maruzz@matrice.it>
For porting iODBC (Unix ODBC).
- Xavier Leroy <Xavier.Leroy@inria.fr>
The author of LinuxThreads (used by the MySQL Server on Linux).

G.6. Tools that were used to create MySQL

The following is a list of some of the tools we have used to create MySQL. We use this to express our thanks to those that has created them as without these we could not have made MySQL what it is today.

- Free Software Foundation
From whom we got an excellent compiler (`gcc`), an excellent debugger (`gdb` and the `libc` library (from which we have borrowed `strto.c` to get some code working in Linux).
- Free Software Foundation & The XEmacs development team
For a really great editor/environment used by almost everybody at MySQL AB.
- Julian Seward
Author of `valgrind`, an excellent memory checker tool that has helped us find a lot of otherwise hard to find bugs in MySQL.
- Dorothea Lütkehaus and Andreas Zeller
For `DDD` (The Data Display Debugger) which is an excellent graphical front end to `gdb`.

G.7. Supporters of MySQL

Although MySQL AB owns all copyrights in the `MySQL server` and the `MySQL manual`, we wish to recognize the following companies, which helped us finance the development of the `MySQL server`, such as by paying us for developing a new feature or giving us hardware for development of the `MySQL server`.

- VA Linux / Andover.net

Funded replication.

- NuSphere

Editing of the MySQL manual.

- Stork Design studio

The MySQL Web site in use between 1998-2000.

- Intel

Contributed to development on Windows and Linux platforms.

- Compaq

Contributed to Development on Linux/Alpha.

- SWSoft

Development on the embedded `mysqld` version.

- FutureQuest

`--skip-show-database`
